The fight basically revolved around two transmission techniques: baseband as employed by Xerox, and broadband, the ▶

David Liddle

chosen method of Wang Laboratories, Inc., Sytek, Inc. and others. Baseband features only one channel for message transmission while broadband offers multiple channels.

Xerox and Ethernet looked worse and worse as the conflict continued. Then, just as quickly as it had started, the battle was over.

Third-party negotiators pointed out the fact that the two rivals could coexist. It was the application, not the technology, that mattered. The media lost its appetite for the fray. End of battle. Uneasy truce.

Liddle and former Xerox Office Products Division President Donald Massaro left Xerox to start Metaphor Computer Systems in October 1982. Metaphor expects to have its first products available later this year. According to Liddle, they will provide local and remote access for business communications users.

On Communications *Editor Bruce Hoard talked with Liddle recently about the Ethernet days and found him far more open and opinionated than ever before.*

What emotions do you experience when you remember the days when Ethernet was first introduced?

Well, it is complex. I feel good about it in the sense that Ethernet has actually done all the things that people were skeptical about: that it could become a standard or be widely adopted or that vendors would make parts for it. In that respect, that has all happened.

I was surprised — in retrospect, I shouldn't have been — at how much basic resistance there was to the idea of adopting a local-area network standard. I thought it would be relatively easy because Ethernet was well described; we had a lot of experience with it.

There were several major vendors signed up for it, so it wasn't a proprietary advantage to any particular class of vendor.

And I remember back then wondering why there was so much foot-dragging.

There were quite a lot of people who attended all the meetings without any real enthusiasm to push something through, simply out of the fear that somebody's ox would get gored if anything became a standard.

"There were quite a lot of people who attended all the meetings without any real enthusiasm to push something through, simply out of the fear that somebody's ox would get gored if anything became a standard."

So, looking back on it, is that how you would explain the foot-dragging?

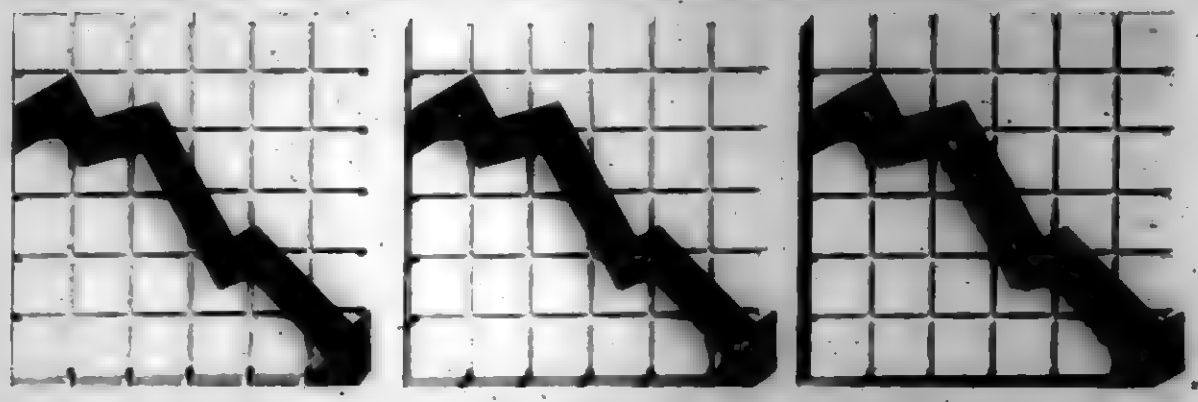
Yeah. You see, the problem with the foot-draggers is that almost all of them have come around one way or another, either to the Ethernet standard or a close variation of it.

Will you name any names there?

You probably recall that [Hewlett-Packard Co.] went through a period of reluctance, and the executive vice-president was saying that Ethernet had "dangerous grounding and finite addressing." Of course, HP adopted Ethernet and uses it now. They simply wanted to put their

SIEMENS

SATURN PABX. The Business It Saves...



In an age in which the ability to communicate quickly and cost-effectively has become vital to the continued success, growth and even survival of your business…choosing your next PABX system just might be the most important business decision you'll ever make. But it needn't be a difficult one, thanks to Siemens, a world leader in advanced telecommunications technology.

SATURN™, our third-generation digital PABX family provides growing businesses with all the benefits of a dependable, feature-filled voice system—plus the designed-in capability to expand incrementally to include simultaneous voice/data communications as required.

Designed with an eye on your business future, SATURN offers simple, flexible, non-blocking architecture…facilitating your local office network design. And SATURN can provide additional features and capabilities through straightforward software enhancement. What's more, SATURN doesn't require a special "computer-room environment" to operate—an important consideration in today's cost-conscious business world.

Sophisticated performance, engineered for simplicity and savings… SATURN offers the ability to integrate the diverse technologies in your office—telephones, electronic mail, voice messaging, data terminals, computers—forming a powerful communications tool to upgrade productivity and increase business efficiency as it monitors, controls...and reduces business costs.

SATURN...
Advanced PABX technology from Siemens.

fingerprints all over whatever was adopted as a standard, feeling that they were otherwise going to be at a marketing disadvantage with Xerox and [Digital Equipment Corp.], I guess.

HP held things up for a long time and turned around at the last minute and said, "Yeah, well OK, we ought to approve this now. This is all right after all."

That was sort of a surprise to me, because HP is a very progressive company. They've done a lot in the general area of standards, and there were never really any technical disagreements about it. It was more a question of: "What will this mean to us out there in the marketplace?"

"We were just trying to say, 'Look guys, this isn't a galactic telecommunications system. It's a simple network. You ought to be able to hook lots of different kinds of stuff to it, and we at Xerox are committed to making that happen.' "

And I shouldn't just characterize HP that way, because I think a lot of companies felt that way. There was a certain fear that Xerox, DEC and Intel [Corp.] had something "up their sleeves" or some hidden thing on the agenda, and that simply was not true.

We all wanted to create a situation in which we thought we all would be able to sell a lot of products by having it be more interconnectable.

There was a lot of talk about baseband vs. broadband confrontations at IEEE-802 meetings and that the Wang people in particular were against Ethernet.

That was really different in that it was solely a marketing motivation. I mean, if you go to those guys now, you can find that they've basically just quit and given up on it.

Given up on Wangnet?

Sure. By any comparison to all the wild claims that they made. But, if you think about what happened there, we introduced Ethernet as a simple concept.

We were just trying to say, "Look guys, this isn't a galactic telecommunications system. It's a simple network. You ought to be able to hook lots of different kinds of stuff to it, and we at Xerox are committed to making that happen."

Well, that was more simplistic than we meant it to be. Many, many customers turned around and said, "Well, gosh, here's a network I can hook everything to. What are you doing Wang? What are you doing, IBM, along these lines?"

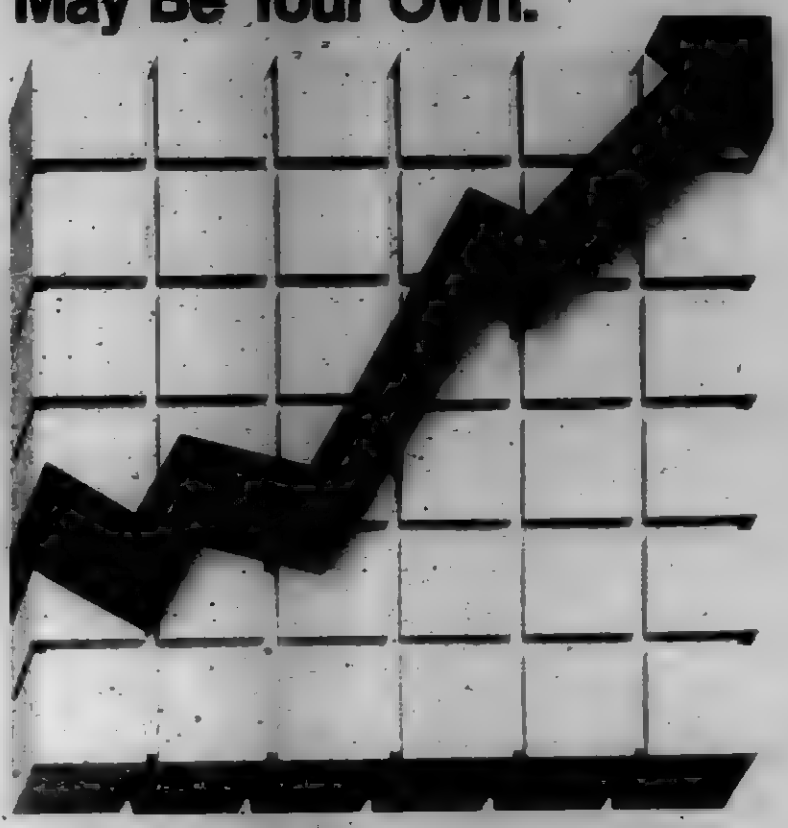
And that became very threatening, if you see what I mean. That was not what we intended to do, but that was part of the reaction. And so Wang immediately jumped up and said, "Whatever you can do, we can do twice as well.

Ours will not only be broadband, but will go at 12M bits in the high end, the Wangband, rather than the 10M bits that you're doing."

And they made a lot of claims that it had a specification and a price long before they had done any real development.

What has happened since those early days in the area of local networks

May Be Your Own.



So before you choose your next PABX, you owe it to yourself—and your business—to take a close look at SATURN. After all, it's nobody else's business but your own.
For further information, or the name of the SATURN Gold Seal Dealer in your area, call 1-800-327-0636.

David Liddle

that you least expected to happen?

The thing that I least expected was that the IEEE would agree to endorse, at least discuss endorsing, a network standard with a totally exhorbitant licensing fee like the one for the ring net.

The first thing that happened following the first meeting of the IEEE-802 committee was that committee chairman Maris Graube called me up and said, "Now David, we can't proceed any further with even looking at an Ethernet-like standard until you promise us that you'll license it openly at a very reasonable fee — that's IEEE policy."

"We licensed Ethernet for $1,000, and that was just because that was what it literally cost us to process the license paperwork and allocate blocks of addresses. Well, people huffed and puffed about that and said 'OK, 1,000 bucks, that's fair, we'll go along with it.' "

And I said, "OK, we'll do that, let me go off and count the beans." And he said, "Now, IEEE-488 is licensed one-time only for $400." I said, "Right, that was a few years ago, let me go and look at what we can do."

And as you well know, we licensed Ethernet for $1,000, and that was just because that was what it literally cost us to process the license paperwork and allocate blocks of addresses to people who wanted to have a unique address block. Well, people huffed and puffed about that and said, "OK, 1,000 bucks, that's fair, we'll go along with it."

But before they could even have another meeting, I had to agree to that and dot the i's and cross the t's.

Now you have this situation where the same group says, "Well, IBM's paid a million bucks or whatever it is [the actual figure was over $5 million] for free rights to this token ring of Soderblom's [Olof Soderblom is the inventor of a local-area network token passing scheme].

I believe that the deal is $65,000 or $75,000 up-front payment plus $50 or $100 per connection [the actual charge is $25,000 up-front plus $45 or 7% of the value of each attached node].

What do you think of that?

It is ludicrous that the IEEE would even discuss it. If I had said that to them, they would have kicked me out. But because IBM is pushing this standard, and the IEEE is so fearful of not "making a standard" around something that IBM has agreed to do, they looked at it differently.

In other words, the arrow's been shot at the barn, so now they want to paint a target around it.

What hasn't happened that you thought would happen?

I thought that broadband campus or backbone-type networks would go a little faster than they have.

You've talking about networks like Sytek, Inc.'s?

I mean they are all in a sense the same. That is, all of those guys offer that kind of a network. Ungermann-Bass, [Inc.] does, Sytek does, 3M [Corp.] does and so on.

I'm not talking about the success of any one

Our 3000 family of printers has an impressive list of features. But the most prominent new change on our printers is our new name.

Formerly the Data Communication Products Department of General Electric, we're now independently owned...and our new name is Genicom.

So the GE 3000 family is now the Genicom 3000 family. But while the name has changed, the product retains its established superiority.

The Genicom 3000 series of output printers still features speeds from 40 to over 400 cps. Single or dual-mode printing. Type quality from EDP to NLQ. Multi-color printing. Graphics. Selectable type fonts. American craftsmanship and more.

Genicom 3000 printers will be as popular as ever with end users as well as OEM's, distributors, retailers and dealers...thanks to our list of outstanding features, plus the unique commonality advantages of several models all based on a single design.

And Genicom will also offer other products including our 2000 teleprinters and the soon to be introduced 4000 shuttle matrix printers. You'll find we have the same complete product line we had with GE.

Genicom. We have proven products, experienced personnel, established manufacturing facilities, a nationwide service network, plus a new commitment to excellence that stands behind our new name.

Genicom Corporation, One General Electric Drive, Dept. M311, Waynesboro, VA 22980. In Virginia, call 1-703-949-1170.

company because the companies are doing fine, but I was just expecting more of them to be out there than there are now.

Why aren't there more of them out there?

I don't really know. I suspect that it's worrying about IBM. It may be because there isn't any standard, and it may be because the connection technology is sort of inherently more expensive until somebody really tries hard to drive those costs down. That, as you know, is what happened with the Ethernet.

How viable are local-area networks as they were originally envisioned? Do people really need multimegabit workstations on their desks?

It sure looks that way to me. Look at the people who are distributing software. Look at the network software trend. For instance, you now have 3com [Corp.], for one, and lots and lots of other people selling their own and other peoples' software in a network configuration.

By that I mean you buy a file server and a networkwide license for software, and you've got one standard set of the software for which you've paid a one-time charge.

That gets downloaded out to the individual workstations, and you get a lot of data that's distributed in that way.

You're seeing more and more use of networks where the stuff that used to go from a disk directly into memory is now passing through a network on the way.

How did you think [private branch exchanges] would fit into the local-area network scene when Ethernet was first introduced?

I always figured that PBX vendors would offer as one of their interfaces a port onto which you could hook an Ethernet to allow traffic along your high bandwidth, processor-oriented devices.

I thought that people would continue to use the PBX to carry voice and to carry relatively low-speed digital data — by that I mean up to 200K bits to support intelligent terminals and things like that.

In your opinion, is that the way that things have more or less evolved?

I don't really know how they've evolved at the PBX level, but I have certainly seen a lot of people do what I just mentioned. I have not seen any significant number of PBXs interconnecting multiple computers or multiple substantial servers.

All the PBXs that I know of that support digital traffic are installed with a lot of terminals getting access to one or two mainframes.

What came out of the great broadband vs. baseband debate?

"I always figured that PBX vendors would offer as one of their interfaces a port onto which you could hook an Ethernet to allow traffic along your high bandwidth, processor-oriented devices. I thought that people would continue to use the PBX to carry voice and relatively low-speed digital data — by that I mean up to 200K bits to support intelligent terminals and things like that."

Baseband. I think that broadband vs. baseband was a marketing approach.

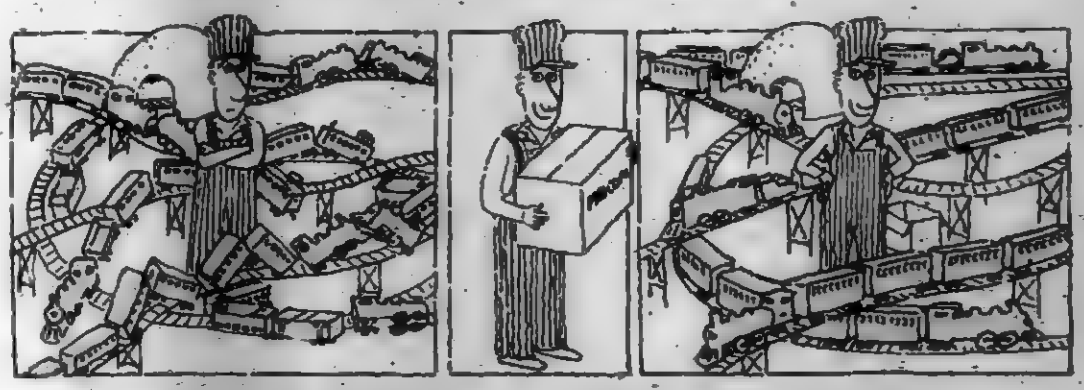
Wang is a remarkably brilliant company sometimes. When they are pressed a little bit, they do really some remarkable competitive things. All of a sudden, you're talking to bankers and manufacturing people and lawyers and everybody else that buys this stuff, and you're talking about modulation techniques, not about whether it costs less or has more data flowing through it.

You're not asking whether there are many vendors supporting it or if you get it to work or if you have to retune it or any of that stuff: These were the reasons we didn't use broadband.

It seemed at the time that Ethernet was really on the losing end of this marketing war. What was it like for you during the period of that war? Did you find yourself getting frustrated?

WHEN IT COMES TO CONTROLLING YOUR DATA NETWORK,

THE IDX-3000™ PUTS YOU ON THE RIGHT TRACK.



Control can be a major problem with a large network. That's why our IDX-3000 Local Communication System features the IDX-Net™ network controller. With IDX-Net, you handle configuration management on-line. You can manage major network topology changes, such as disaster recovery, with only a few keystrokes.

IDX-Net lets you access network control commands and diagnostics from any terminal in the network, including dial-up. This means that you, or MA-COM Linkabit's Hotline Service, can diagnose your problem in seconds without having to be in your computer room.

Programmability
IDX-Net's 68000-based network controller software provides you with the capability to interface host-resident application programs to the network. You can build-in your own custom-tailored network management features.

User convenience
In addition to traditional data/PABX port contention and resource selection, IDX-Net provides your authorized users with many of the features offered by modern telephone systems. They can connect, disconnect and hold lines to multiple computer resources and execute third-party connects.

For the office of now
With the IDX-3000, you can start with a small system that fits your current needs and budget, then grow to obtain non-blocking, full-duplex asynchronous communication for as many as 3072 lines, all at data rates of up to 19.2 Kbps. The IDX-3000's proven TI-based technology is fault-tolerant, with optional redundancy features throughout its distributed architecture, and automatic, continuous self-testing. The IDX-3000 isn't one of those products of the future. It's here now—proven, in use, and backed by MA-COM, one of the nation's largest communication companies.

If you want to get control of your network, contact Ruth Stoffel at MA-COM Linkabit, 3033 Science Park Road, San Diego, CA 92121, toll-free (800) 626-6640 or (619) 457-2340. We'll put you in control.

THE NETWORK YOU CAN CONTROL

MA-COM

BE A HERO. BUY A HERO.

Heros were meant to rise above it all. So why is it you keep getting caught in the middle? Is it your fault that personal computers in every department are hoarding data? They won't even have a simple conversation with the mainframe.

Why should you be pestered by complaints when work is lost? Or duplicated? Even triplicated? Not to mention what happens to costs.

Your organization is a victim of Computer Shock. Badly in need of a HERO™.

HERO RESCUES COMPUTER WORLD FROM CHAOS.

MDS HERO is the intelligent, desktop Networked Personal Computer. It does everything a personal computer can do. And more. But most of all, our HERO is famous for interacting—it works beautifully with mainframes.

With the MDS SUPER 21™ Communications Processor, HERO can converse intelligently on IBM networks. HERO emulates IBM 3270 SNA and 3776 remote job-entry systems. Our SUPER SNA™ option gives you both on one communications link.

HERO also runs software under MS-DOS. Plus its own multi-tasking operating system.

HEROS OF THE WORLD UNITE.

With HERO and SUPER 21 on your side, there's no end to what you can conquer. You can draw on private, departmental, and corporate databases. Bring individual workstations out from their isolation. Thanks to you, information will be bound together, in a network of organization. All under your control.

What's more, if you take advantage of our own INTELLIGENT 3270™ (only MDS has it), your people can write their own programs, and integrate them with data in the mainframe. Using HERO, you can reach into the database and retrieve information. Then either return it, or store it at the workstation.

HEROISM GETS REWARDED.

With our HERO and SUPER 21, you'll have what's out-of-control under control, fast. Your current data processing investments will become part of a growing bank of knowledge. All of it cost-efficient.

Besides, old HEROS never die. Nor do they fade away. They're modular in design, so they manage to be immortal. They grow with you. All the way.

YOU CAN BE BIG WITHOUT BEING BLUE.

MDS is everywhere Big Blue is. We even stretch beyond the Blue horizon. And we grew big for one big reason: we've helped our customers to grow.

MDS can do the same for you, too. Wherever you are on this Big Blue planet, we'll give you more than mere office automation. We'll organize your organization. Our service people will be at your beck and call. Around the globe. Around the clock.

So be a hero. Buy a HERO. Ask our customers about us. And give us a call. Dial **800-MDS-HERO.**

You'll soon see that heroism has its rewards.

MDS MOHAWK DATA SCIENCES

MDS is a registered trademark and HERO, SUPER 21, INTELLIGENT 3270 and SUPER SNA are trademarks of Mohawk Data Sciences Corp. MS-DOS is a trademark of Microsoft, Inc.

David Liddle

Well, yeah, in the sense that yo-yo journalists and consultants were writing a lot of stuff without doing their homework.

I would get a clipping from a sales rep coming back and saying, "A guy at major account X asked us to explain why this is true or why this isn't true."

And as soon as it was cleared up, they wanted to buy X number of workstations. That was incredibly frustrating, the reason being that Wang had gone and said, "Well, we are going to do all this unbelievable stuff, and we are going to do it all 18 months from now."

For a while, you couldn't press them very much on where the results were.

By the way, although it doesn't effect me now, by the time it was clear that Wangnet had failed so miserably and that their claims were so completely unfounded and that they had gone through a whole collection of product managers like tissue paper, the press lost interest.

"By the way, although it doesn't effect me now, by the time it was clear that Wangnet had failed so miserably and that their claims were so unfounded and that they had gone through a collection of product managers like tissue paper, the press lost interest. Nobody ever writes about or cares about Wangnet any more; they're only interested in it as a plausible opponent to Ethernet."

It's funny — nobody ever writes about or cares about Wangnet any more; they're only interested in it as a plausible opponent to Ethernet.

I was frustrated by that at the time, and one of the worst things about it was that in order to hit back effectively at that kind of talk about broadband, you had to trample on some little and fairly worthy broadband vendors that were not making any unreasonable claims at all.

We were trying to offer a real service that everybody needed. I did not want to "fight" against broadband.

The companies like Sytek and Ungermann-Bass and others were building a product that was needed, but not as a local-area network to hook up four separate workstations.

Did Xerox's top management back you at the time?

You bet. They certainly did. They really backed me on all of the Ethernet stuff, and they never wavered about whether it was OK to have done this. They never flinched about all the broadband stuff and all that. They were very good about it.

The president and chief executive officer of Xerox would clearly say where we were going with Ethernet, what we felt was important about that, why we were pursuing the IEEE and why we hadn't gone with broadband and so on. They were really very solid about it.

If you knew then what you know now, what would you have done differently?

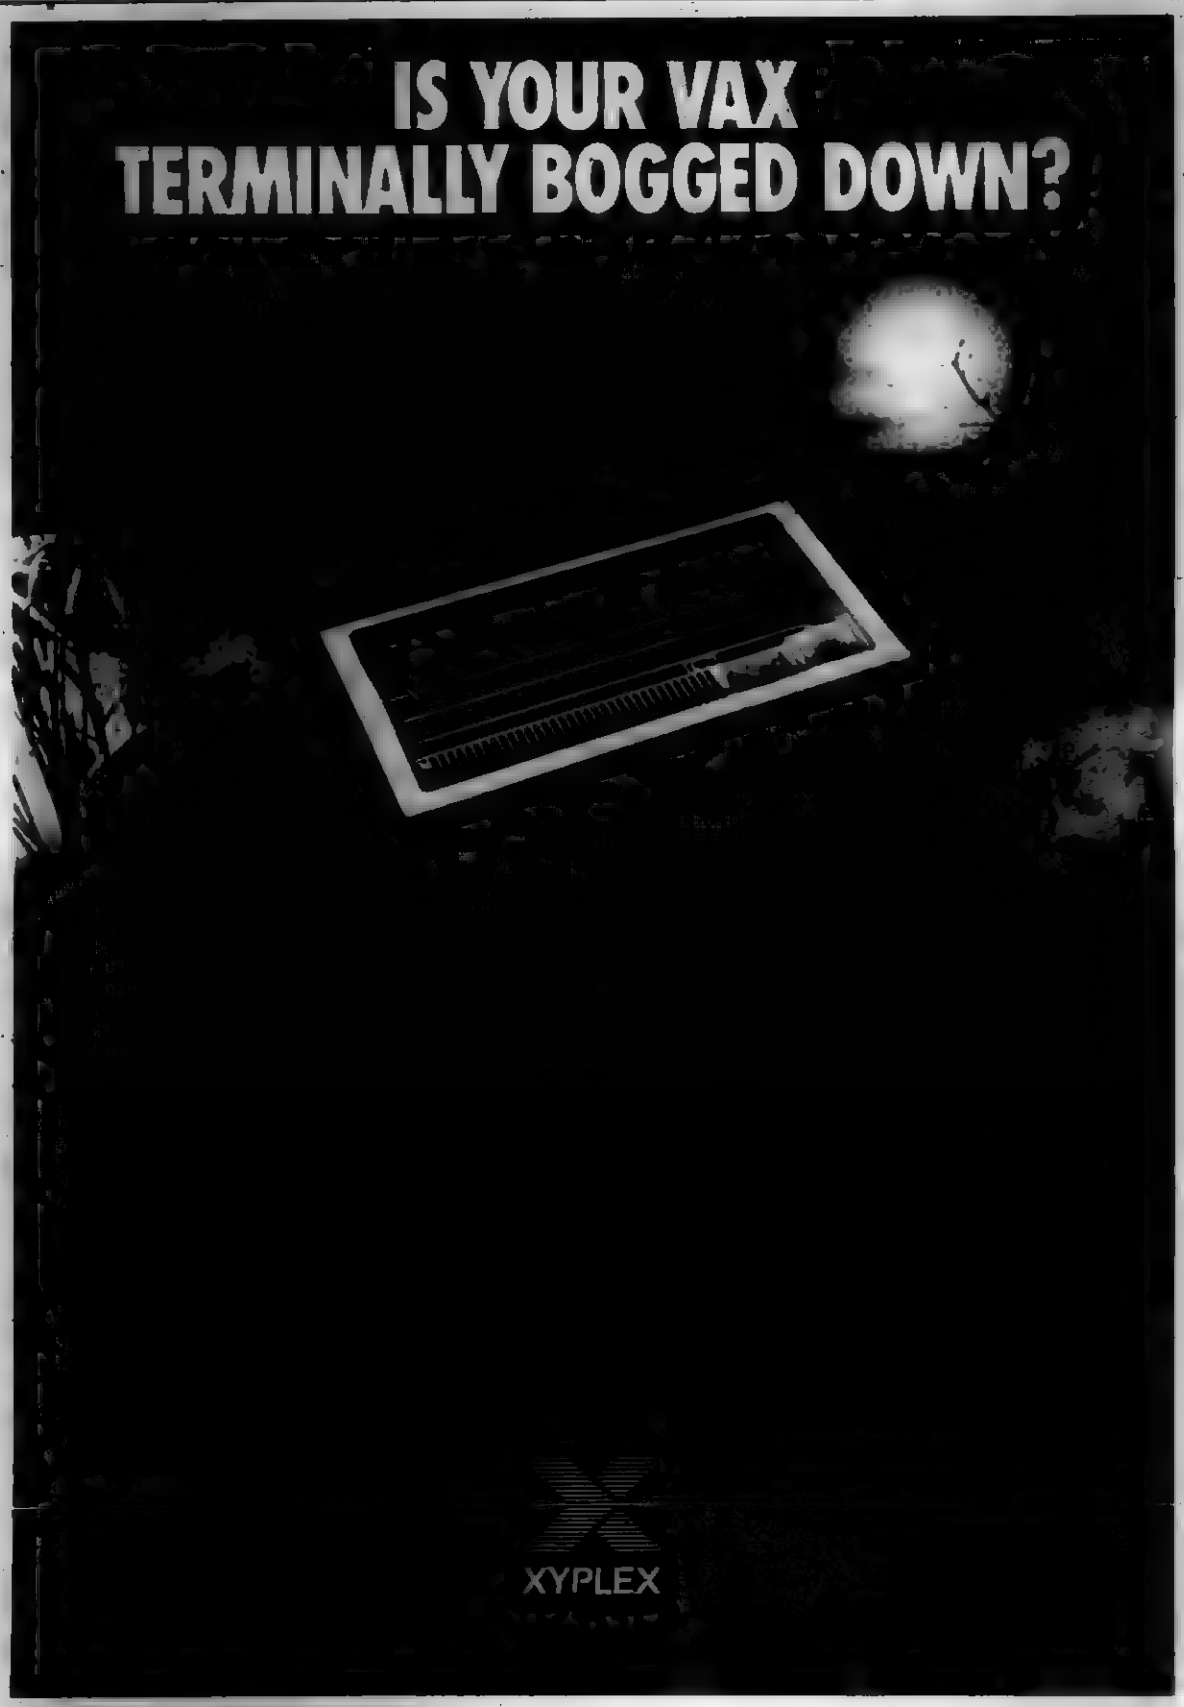
I would go to IBM and say "I have seen the future, and I know you're going to have a terrible time with this ring net. Why don't you sign up?"

We did chat with IBM about Ethernet. They looked at it and decided it wasn't a sensible way to go.

But if I were armed with the information that exists now, I'd go to IBM and Wang and say, "Look guys, honest, this isn't a commercial ploy, and it will be a better world for all of us if you agree to use this lower level protocol. You can remain independent in higher level protocols if you choose, but at least we'll be driving down hardware costs and sort of opening the door."

Otherwise, there wasn't a lot that we could have done differently. We threw the door open on it at the earliest moment with [Digital Equipment Corp.] and Intel and swore an oath in blood that we would change those things where it could really be shown that it improved the quality of the product.

But we weren't going to politicize the whole thing and try to fence certain people in and certain people out and all that sort of stuff. I think that was really all we could do. ■



Special Section: Local-Area Networks

A NETWORK PERSPECTIVE

By Jim Bartimo

Whither the local-area network? While two years ago, the talk of local-area nets seemed unending, today it is almost unfashionable to think about them. "There was a time when a week wouldn't go by when you didn't get a flyer for another seminar on carrier-sense multiple access with collision detection [CSMA/CD] vs. token passing," one Wang Laboratories, Inc. engineer

---

Bartimo is senior writer at InfoWorld, *the magazine for microcomputer users, Menlo Park, Calif.*

said with a sigh.

Even the most astute industry observer has the right to ask, "What happened?" The answer is that a number of factors have changed in the local networking industry since Xerox Corp. released Ethernet, one of the first local-area networks, three years ago.

Even the most astute industry observer has the right to ask, "What happened?" The answer is that a number of factors have changed in the local networking industry since Xerox Corp. released Ethernet, one of the first local-area networks, three years ago.

Although International Data Corp. (IDC) reports that there are approximately 16,000 local-area networks installed today, many users are confused, frightened and suspicious of the technology's slow acceptance in the market.

The introduction of fourth-generation private branch exchanges (PBX) that can switch data at high speeds is but one of the monkey wrenchs thrown into the networking picture. Some vendors claim a PBX can fill the need of a local net.

TO DISMAY USers even further, IBM has yet to announce officially a local-area network that would work with its alphabet soup of architectures such as Systems Network Architecture/Synchronous Data Link Control (SNA/SDLC) and Distributed Office Support System (Disoss). IBM's 3270 version of its Personal Computer is another networking tool to consider, since its double personality can use a mainframe for file exchange and other networking functions.

IBM and the PBX came into the picture just when most users were still trying to discern the differences between CSMA/CD and token-passing access methods; broadband or baseband bandwidths; coaxial, fiber-optic or twisted wire pair cable; and star, ring or bus topologies. For those that did not learn these terms during the first go-round, a brief description is in order:

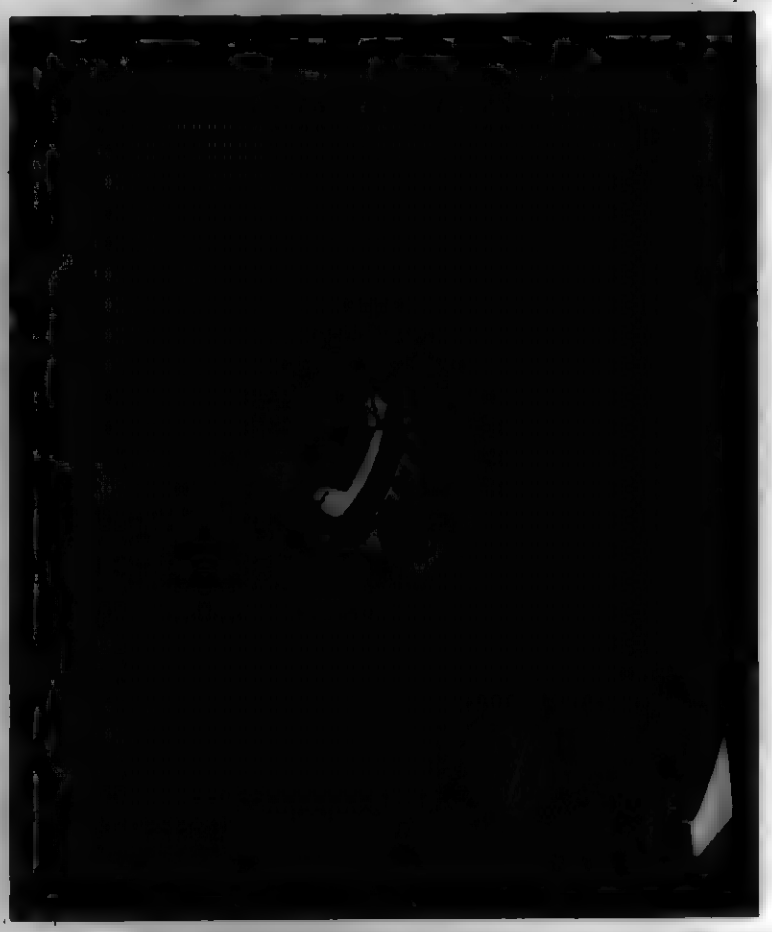
■ *Broadband vs. baseband.* Broadband local-area networks such as Wang's Wangnet can transmit data, graphics and even video because they feature a wider bandwidth and multiple channels piped through the cable. Baseband networks transmit over only one channel, but one baseband network, Ethernet, is now thought to be a de facto standard by many users and industry observers. Broadband networks are also available from Sytek, Inc. (Localnet) and Ungermann-Bass, Inc. (Net 1), among others.

"I don't think it's an issue of broadband vs. baseband," said Kim Myhre, manager of communications research for IDC. "That is a marketing ploy of the companies that support those technologies. The two technologies work well together.

"For instance, you may have a number of baseband rings connected by one broadband network," Myhre said.

■ *Coaxial, fiber-optic and twisted wire pair cable.* These three types of cable each offer at least one advantage and disadvantage. Coaxial cable is the thick

A SMART PHONE SYSTEM SHOULDN'T MAKE YOU FEEL DUMB.



With most smart phones, the only way you can access advanced features is through complicated calling codes.

With Focus ET, you just push a button.

Because Focus gives you five fixed buttons and 18 programmable buttons to work with. The five fixed buttons are pre-set for convenience functions like hold, flash, microphone on/off, speaker on/off, and call transfer. The other buttons can be programmed individually. For example, you can push one button and transfer all calls directed to your station over to another station within your network. Push another button to reach a busy station or outside line without redialing. Page hard-to-find people. Dial automatically. And more. Plus, Focus ET gives you one-button access to multiple business and private lines.

To make your calling even easier, all 23 buttons are labeled in plain English. So you don't have to look up instructions or secret operating codes to find the feature you want.

Our smart phone comes in two models: The Focus ET I, with all the advanced features mentioned above, and the Focus ET II with the same features, plus a 40-character LCD display. The display clears the clutter of message slips by recording the names and numbers of callers directly on your phone. The messages can't be misplaced or mistaken for trash. And only you can forget them.

Our Focus ET is the smart phone for smart business people. So next time you're looking for an important message or operating instruction, stop. And look up American Telecom at 3190 Mira Loma Avenue, Anaheim, CA 92806, (714) 630-7721, TX 685571.

American Telecom Inc.

CHANGING OUR NAME WAS A STICKY BUSINESS.

After 14 years as Intertel, it wasn't the easiest thing to do. Sure there were the obvious problems; like licking 19,453 labels so we could show off our fancy new logo. But we also found that Intertel was more than just a name to the hundreds of companies that depend on our network command center systems and diagnostic modems for high-availability data communications. It was a constant reminder to them of our commitment in providing the products, support, and services they need to keep pace with the ever increasing size and complexity of their private line networks.

However, we had to face the fact that our old name described only a part of what our current products can do and what the systems we are developing will offer in the future. We decided that changing our name would be an important first step in linking our past accomplishments with future networking needs.

Now, when you think of controlling, managing and measuring the performance of large networks, remember what we did as Intertel. When you need to assure fault-tolerant operation of networks with both analog and digital links, remember Intertel did it first. But when you're ready to find out more about our networking capabilities, please think of them as INFINET.

INFINET

Six Shattuck Road

Whither?

cable that subscription television companies use. It offers reliable transmission, but can be costly and cumbersome to install. Fiber-optic cable provides very fast transmission, but can be sensitive to shock. Twisted wire pair cable, although already installed for telephones, is slower in transmission speed.

■ *Token passing vs. CSMA/CD.* Both of these access methods prevent messages from crashing into each other on the network. Token passing is thought to be IBM's preferred method. CSMA/CD is the method used in most other baseband networks, such as Ethernet and Wangnet.

■ *Star, ring and bus topologies.* These three topologies describe the arrangement of the devices on the network. In a star network, all the devices connect to a central node, which is usually a switch or controller. Multiple star networks are sometimes connected to a larger star network to create a hierarchical configuration offering higher and higher levels of connectivity.

Devices in a ring topology hang off a circular connection and therefore must have the capability to recognize which messages are headed for a particular device and which messages should continue around the circle.

As is the case with a string of old-fashioned Christmas lights, if one node fails, so does the entire ring.

In a bus configuration, all devices share a common backbone connection. Because the devices are in effect directly connected to each other via the bus and interface units, the failure of one node does not affect the other nodes in the configuration.

ACCORDING TO Harvey Freeman, vice-president of engineering at Architecture Technology Corp. in Minneapolis, there are three network access standards today: CSMA/CD as used in Ethernet; token bus as used by Concord Data Systems, Inc., Datapoint

To all reps: Price changes on following items effective immediately: Mo. 10-11A, 10-14A, 10-AL.

Chris: The latest offer looks better, although it's still not what we were hoping for. Try for another compromise.

Just got the word from Gary. Increased our share by 6%. If trend holds, we'll pass competition by third quarter!

Smartcom II communications software, currently available for IBM PC, DEC Rainbow 100, Xerox 820-II and Kaypro II.

Microcomputer communications? Get control of the situation with

Hayes™

Microcomputer communications can present the DP/MIS staff with a tangle of mis-matched hardware, user-hostile software, and a situation that can quickly get out of hand.

Hayes can help you avert that chaos, with a telecomputing system designed expressly for microcomputers.

A system so advanced, it's downright simple. Economical. And requires no handholding from you.

Hayes. The computer's telephone. Our Smartmodem 300™ and Smartmodem 1200™ connect to any desktop computer with an RS-232C port. They operate with rotary dial, Touch-Tone® and key-set telephone systems. At full or half duplex. And both feature self-test capabilities, as well as indicator lights and built-in speakers for monitoring calls.

The lower-priced Smartmodem 300 is ideal for local data swaps and communicates at 300 bps. A built-in speed selector on Smartmodem 1200 automatically detects transmission speeds (110, 300 or 1200 bps).

Smartmodem 1200B™ is also available as a plug-in board for IBM® Personal Computers. And Hayes manufactures the Micromodem IIe® for Apple® II, III, IIe and Apple Plus computers, as well. It comes packaged with Smartcom I™ communications software.

Speaking of software, more programs are written for Hayes modems than for any other. And that impressive list includes our own incomparable communications software.

Smartcom II.™ Complete, menu-driven software for the IBM PC, DEC Rainbow 100,™ Xerox 820-II™ and Kaypro II.™ Even first-time communicators will find success with Smartcom II. Screen prompts guide users in the simple steps it takes to create, send, receive, list, edit, name and re-name files.

Tasks like simultaneously receiving, printing and storing data—completely unattended—are easily managed with Smartcom II, because it takes full advantage of Smartmodem's capabilities.

The program reduces lengthy dial-up and log-on sequences to a single keystroke. It stores communications parameters for 25 remote systems.

Plus, there's an on-line help feature that explains prompts, messages and parameters.

Our reputation speaks for itself. Hayes has five years of solid leadership in the microcomputer industry. Nationwide availability through retail computer stores. Trouble-free factory service and call-in assistance. A limited two-year warranty on all hardware. And the most efficient telecomputing system available. Anywhere.

If you're involved in linking micros or setting standards for configurations, remember this. Everything your people need to know about communications can be summed up in one word: Hayes.

Hayes®

Hayes Microcomputer Products, Inc., 5923 Peachtree Industrial Blvd., Norcross, GA 30092. 404/441-1617.

Smartmodem 1200 for all computers with an RS-232C interface; Smartmodem 1200B plug-in board for the IBM PC.

Smartmodem Specifications
Low Speed Data Formats (Smartmodem 1200 and Smartmodem 300) Serial, binary, asynchronous: 7 or 8 data bits; 1 or 2 stop bits; odd, even or no parity (0-300 bps).
High Speed Data Formats (Smartmodem 1200) Serial, binary, asynchronous: 7 data bits; 1 or 2 stop bits; odd, even, or fixed parity or 8 data bits; 1 or 2 stop bits; no parity (1200 bps).
Dialing Capability: Touch-Tone® and rotary-dial pulse dialing.
Command Buffer: 40 characters.
Commands: (unnecessary with Smartcom II software) A: Immediate answer. A/: Repeat last command. C: Transmitter Carrier. D: Dial command, including simple dialing, waiting for second dial tone, auto-dialing and other features. E: Local echo. F: Full/half duplex. H: Switch hook. M: Audio monitor. O: On-Line. P: Pulse dialing. Q: Quiet mode. R: Reverse originate/answer mode. S: 17 "Sn=" commands speed, escape code character, number of rings to answer on, etc. S?: Check operational parameters above. T: Touch-Tone dialing. V: Verbal result codes.
Result Codes (can be suppressed/verbal): 0/OK: Command line ok. 1/Connect: Carrier detected. 2/Ring: Phone is ringing. 3/No Carrier: Carrier lost or never heard. 4/Error: Error in command line. 5/Connect 1200: Carrier detected at 1200 bps. (Smartmodem 1200 only.)
Audio Monitor: Two-inch speaker with volume control.
Rear Panel: On-off switch, power jack, RS-232C connector, modular phone jack connector, volume control.
Operation: Full or half duplex.
Data Rates: 0-300 bps and 1200 bps for Smartmodem 1200. 0-300 bps for Smartmodem 300.
Interface: RS-232C.
Intelligence: Z80™ microprocessor with 4K bytes control program for Smartmodem 1200; Z8 microprocessor with 2K byte control program for Smartmodem 300.
Modem Capability: Bell System 103 or 212A compatible originate or answer mode for Smartmodem 1200; Bell System 103 compatible originate or answer mode for Smartmodem 300.
Receive Sensitivity: -39dbm for Smartmodem 1200; -45dbm for Smartmodem 300.
Transmit Levels: -10dbm.
Registration: FCC registered for direct connect to the nationwide phone system. Connects with modular jacks RJ11W, RJ12C, RJ21W, RJ22C, RJ31W, RJ32C.
Power Needs: D.C. Input 12VDC, 600ma. 15.5VAC output.
Size: 1.5" × 5.5" × 9.5"

matchmaker, matchmaker.

A word processor and a computer aren't a match made in heaven.

Of course, neither are a telex machine and CRT. Or any of the machines listed here.

Rather, they're all matches made by us: ITT World Communications.

You see, until we came along, it wasn't very easy for businesses to send information from a word processor to a computer. Or from a telex to a CRT. Or vice versa.

Now all that (and more) is possible—by sending information through us.

Our network simply eliminates all the usual problems of unlike equipment.

So a company never has to be in the costly position of owning unneeded terminals, just to "talk" to other terminals.

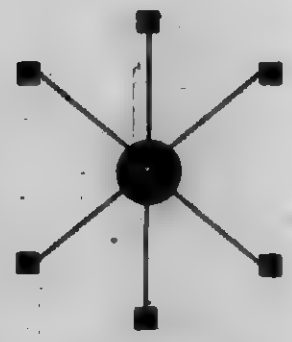
Which means, you'll not only get the communications your company needs, but you could save money as well.

Advanced communications *and* economy?

It sounds like a perfect match to us.

For more information contact your local ITT sales representative or write Marketing Department A/PR, ITT World Communications, 100 Plaza Drive, Secaucus, New Jersey 07096.

ITT



Star Topology

Corp. and Nestar Systems, Inc.; and token ring as used by IBM.

In spite of the confusion over multiple choices, there is hope for the local-area network. IDC predicts a worldwide installed base of 103,210 by 1988.

One user that is extremely pleased with the Ethernet local-area network is the state of Kentucky, an alpha and beta test site for Xerox. "Ethernet has been very good for us," Dobree Adams, director of the state's division of information resources, explained. "With Ethernet, we have demonstrated real productivity gains," Adams pointed out.

With 300 users on the network and five buildings wired together, the state plans to gateway to IBM's Disoss and to a Wang VS system.

"The ability to transfer graphics is the best feature," Adams said.

Another successful beta test site is Chase Manhattan Bank, which has tied together four buildings in lower Manhattan with Wangnet.

And Chase has plans to widen the network to Long Island via microwave and internationally over packet-switched lines, according to Chase vice-president Harvey Hershkowitz.

As Wang's second largest commercial customer, Chase was a natural candidate for beta testing the network in the late '70s. Considering all the changes in local-area networks since then, does Chase regret experimenting with the technology so early?

"We have no regret because we have a system that is up and running, and that is more than most people can say," Chase's Hershkowitz said.

"We're looking at a new PBX network, but it will coexist with Wangnet," he continued.

Chase's attitude toward local-area networks is perhaps the only successful one to which users of local nets can subscribe. There are so many options that a top-to-bottom approach employing, or at least open to, many different technologies is the most feasible option.

"There are four different approaches," according to Michael French, director of communications studies at Quantum Science Corp. in New York.

"For medium-size office automation, Ethernet is quite a good product," French said. "It has limitations in bandwidth, but it is good for office systems," he explained.

The second approach is the networking of personal computers. This low-end networking is led by Corvus Systems, Inc. and Nestar, which will effectively "link together low-cost personal computers with low traffic," according to French.

Big Blue offers the third approach. According to the *IBM Journal of Research and Development* and a host of industry pundits, the IBM local-area network will be a baseband token-passing ring using twisted-wire pairs to connect a variety of ring topologies.

Finally, AT&T will announce a network this year, French maintained. He added that the new AT&T network will be similar to IBM's, but will tie into the System 85 PBX.

. It is interesting to note that AT&T and Wang recently announced a joint agreement that will allow PBX support for Wang's products.

Wang has also announced agreements with Northern Telecom, as have many other data processing vendors. The most notable telecommunications and data processing agreement — Rolm Corp. and IBM — has set the stage for a vendor commitment to hybrid networks.

If gateways to the PBX environment are one half of the local-area network solution, gateways to IBM are the other half. Wang has already announced gateways to SNA for Wangnet. In addition, Xerox claims that it will make a similar announcement sometime in the future.

"SNA serves mainframes, and Ethernet serves the office environment," a Xerox spokesman said.

"We also have a good deal of communications with PBX vendors," the Xerox spokesman continued.

The hybrid network may include baseband, broadband, PBX and IBM 3270 terminal technologies all tied together.

"One should never think of the local-area network alone," said Joseph Ehardt, president of Ehardt and Associates. "People want to see a multivendor approach."

Freeman also espouses the hybrid approach. "Large institutions will use broadband as a backbone for the others such as baseband and the PBX," he said.

Certainly, the price of local-area networks will drop from the $200 to $500 basic connect cost through the use of very large-scale integration. The local-area network controller is being shrunk down by chip makers such as Intel Corp. and Mostek, Inc.

Announced more than a year ago, these chips are expected by industry observers to be available by the end of 1984. As with any technology reduced to a chip, the price will drop dramatically.

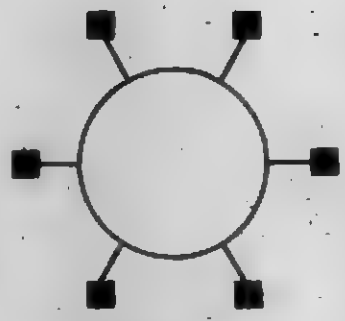
But Myhre is quick to point out that local nets are more than just hardware. In fact, the lack of software is yet another reason some users have stayed away. "Software development has been void," leading to a lot of wires and taps, but no real protocol conversion, he said.

As Hershkowitz put it: "You can call France if you have the telephone, but you still have to speak French to communicate."

According to Dick Parkinson, vice-president of Infotel Systems Corp., B.C., Canada, the software/protocol conversion void is so severe that "the Ethernets of the world are just an alternative to RS-232."

So with the local-area network coming out of its infancy, users are still awash with alternatives. The ultimate motivating factor will probably not be IBM, the PBX makers or even the chip makers.

In spite of all the problems facing local network planning and implementation, one fact remains, as Hershkowitz and Chase Manhattan found out: "People want one terminal on their desks that can access everything." ■



Ring Topology

High-End Local Net: Miracle or Monster?

The purpose of local-area networks — when all is said and done — is to connect different devices to a CPU for file transfer and peripheral sharing.

Many local-area networks fall short of this goal because they do not perform protocol conversion; they only provide the hardware connection.

Perhaps the low-end Xerox Corp. Ethernets and Wang Laboratories, Inc. Wangnets could take a lesson from two high-end big brothers that have emerged to connect mainframes.

The two most notable mainframe local-area networks are Network Systems Corp.'s Hyperchannel and Control Data Corp.'s Loosely Coupled Network.

Hyperchannel allows transmission at up to 50M bit/sec and, with the use of its Netex software, among unlike mainframes from Digital Equipment Corp., IBM and Sperry Corp.

"When you get these Hyperchannel boxes, they allow IBM to talk to other mainframes," Dick Parkinson, vice-president of Infotel Systems, Corp. in B.C., Canada, said. "It's addressed at the operating system level."

Like Hyperchannel, CDC's Loosely Coupled Network allows mainframes to share tape drives and disk drives, but at a somewhat lower speed of 36M bit/sec.

"The people who designed the Hyperchannel had worked here at CDC," according to Ernest Larson, who is CDC's product marketing manager.

According to Philip Enslow, professor of information and computer sciences at the Georgia Institute of Technology in Atlanta, these networks are "used to move files from one place to the other on the mainframe and are very much back-end networks."

IBM's protocol Systems Network Architecture "is primarily a front-end solution," Enslow said.

If these networks can do at the mainframe level what smaller networks cannot do at the lower level, why aren't most users opting for the big boys? According to Kim Myhre, manager of communications research at International Data Corp., it is a question of high prices. The price tags on these networks can run anywhere from $40,000 to as high as $100,000.

While price cuts of up to 35% have been predicted for these networks, the price tags still remain high. Despite this, "it's a growth market because mainframes are a growth market, and there are a lot of multivendor shops out there," John King of James Martin Associates of Carmel, Calif., said.

In addition to high cost, only extremely large shops could make good use of these networks and the cables that are more than an inch thick and cost $30 per foot. "They are monsters," Parkinson pointed out. "They are as stiff as the conduits" into which the cables usually fit.

And while these networks are impressive, they cannot supplant the low-end local-area networks. They can only work with them.

Bus Topology

Special Section: Local-Area Networks

THE TOKEN RING

By David Potter

One of the oldest forms of local network topology is the ring, a physical sequence of stations that closes on itself. The original form has been extended to several important variants. The ring has been studied extensively and implemented both as a research vehicle and in commercial products. The Institute of Electrical and Electronics Engineers (IEEE) 802 Local Network ▶

Potter is founder and vice-president for research and advanced development, Interlan, Inc., Westford, Mass.

Standards Committee has written a draft of a standard for ring topology, token-access local-area networks. As of this writing, that draft standard is on its way through the approval process that will result in it becoming an IEEE standard. It has been endorsed, wholly or in principle, by several companies, including IBM.

Now that the 802 ring is emerging from the laboratory into the harsh light of commercial development, it is important to review the capabilities of the ring that appears to have the most chance of widespread use. The token-passing, ring topology local network is is now available in several forms and promises to be significantly more visible in the future.

Ring topologies, as their name implies, consist of physical sequences of equipment. The simplest of these has the form of a single ring, as shown in Figure 1. In the course of installing and

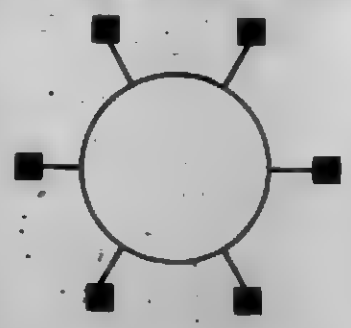

Figure 1. Single Ring

maintaining such a connection, it may be necessary to route connections in accordance with immediate needs rather than in the shortest path. This may result in the pattern shown in Figure 2. The connections also form a ring, but one that is hard to see because of the wiring runs. The wire center was designed to overcome this sort of headache and will be examined in more detail below. Variations of the basic ring topology have been proposed and, in some cases, built to improve reliability or performance.

The use of a ring topology network involves sending data traffic from one station to the next station in the sequence. This traffic may have originated with the first station or may have been received from another station. The process of receive and retransmit continues until the data packet arrives at the station to which it is addressed. That station copies the packet into a memory buffer, marks it as received and retransmits it to the next station.

Eventually, the packet is received by the station where it originated, which removes it from the ring. The time required for a packet to travel completely around the ring is called the walk time. Ring networks have a 1-bit delay in each station. The total of the 1-bit delays and the propagation delay in the cables determines the minimum walk time. The walk time may be made long-

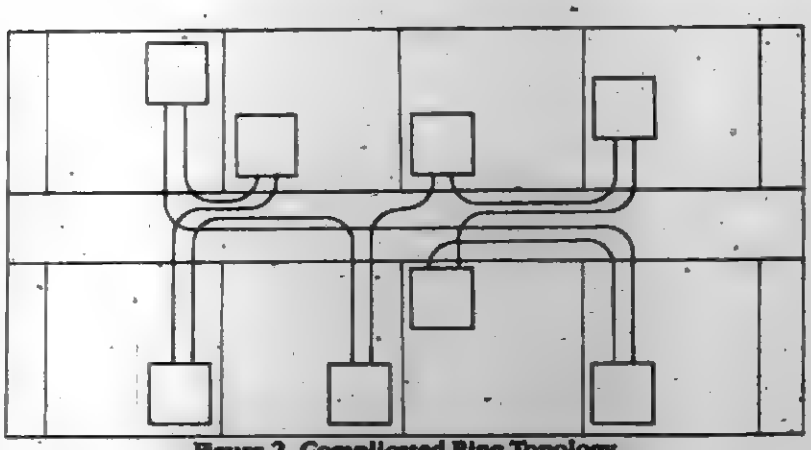

Figure 2. Complicated Ring Topology

er by additional delay in one or more stations. This would be done to ensure a minimum value that allows one complete token frame to circulate.

There are several approaches to managing the right to transmit a packet on the ring. In the most common approach, a packet is marked as "in use" by the state of one of the leading bits in a section called a token. If a station has a packet that it must send, it waits, monitoring the traffic on the ring, until it detects a token that is marked as "available for use." It then sets the bit in the token to its "busy" state and appends its message. It must transmit at the proper clock rate so that its message does not get out of synchronization with the receiving stations's clock.

It may send a long packet, since the packet is removed again at the sending station. At the end of the

When you're ready to talk to DEC* with your IBM 3278, talk to NPI about getting attached to a PCI 74D deconverter.

It will get you everywhere!

When you can no longer stand being cut off from the rest of the world because you have an IBM 3278, come to NPI for a PCI 74D deconverter.

When the time comes that you want to talk to DEC, or check in with the Dow Jones™ News/Retrieval Service, or contact your Local Area Networks, or whatever, talk to NPI first.

Whether you want to make your non-IBM world compatible or your IBM world compatible, NPI is the place to think of first. We distribute and service all PCI products.

Talking to the French computer world is now easier than you think...

. . . with our sister publication Le Monde Informatique.

France's rapidly growing market for computers and data processing systems is one of the largest in the world. Currently, the installed value of general purpose computer systems is more than $11.1 billion, and a tremendous continuing demand for data processing equipment will cause outside spending on computer-related equipment to increase at an annual rate of 16%, between 1981 and 1985.

When choosing new equipment and keeping up-to-date with this ever-changing industry, top systems executives will read *Le Monde Informatique*. *Le Monde Informatique* is a weekly tabloid newspaper with a uniquely targeted circulation of 22,000 copies. The circulation profile was developed by International Data Corporation, the world's leading EDP market research firm, to reach the decision-makers and buying influences at the most important DP facilities in France.

Now Wang gives you office automation on a platter.

Introducing Wang Office.

It's the kind of comprehensive office software and communications package only Wang could put together.

Because only Wang can bring you the most advanced electronic mail. Only Wang can bring you the newest in time and task management. Only Wang can bring you the industry's best word processing.

And only Wang can put all of this together with the world's most advanced communications in one flexible package —easy to put in place and virtually transparent to the user.

With Wang Office you can not only process information, you can send it to, or retrieve it from, any office, anywhere in the world. Instantly. Wang Office.

Thirty years of commitment, innovation and technology.

Yours.

On a platter.

For more information on Wang Office, call 1-800-225-9264. Or write to: Wang Laboratories, Inc., Business Executive Center, One Industrial Avenue, Lowell, MA 01851.

packet, a frame check sequence allows the receiving station to verify the accuracy of what it received. That station may then assert a bit at the end of the packet signal indicating that it has received the packet correctly. The transmitting station would monitor the end of the packet (perhaps testing the frame check sequence to verify a proper operation of the ring) to see if the intended receiver was able to copy the packet. If not, the packet could be sent again. This type of ring is called a token ring.

Another token-based access method involves having several tokens on the ring simultaneously. This is accomplished by dividing a specific walk time, which may be achieved by delays in the stations, into slots. Each slot can accomodate one small packet of fixed size, and each slot has its own token at the beginning. This is called a slotted ring.

There is also a type of ring that uses a contention-access protocol. It is similar to the Xerox Corp. Ethernet in its access rules. A station with traffic to send must defer if there is an active packet being sent, but may transmit immediately if no other station can be heard. Just as in any contention-access method, there is the possibility of a collision.

It is necessary for the transmitting stations to compare what comes back around the ring for at least one walk to detect collisions. When the station finishes sending its packet, it appends a token to the end of its transmission. Another station that has been waiting to send its traffic can seize the token, mark it as "in use" and send without danger of colliding. The contention ring thus acts as a token ring under moderate to heavy use and like an Ethernet under a light load.

The final type of ring is not based on token-access rules, but on register insertion. In this form, a station with traffic to send will insert that packet at the end of some other station's packet while storing incoming traffic in a buffer memory. After sending its packet, the station sends the traffic that has accumulated in the buffer and resumes listening.

The rat's nest of Figure 2 (on Page 46) illustrates one of the practical difficulties that characterize ring topology networks. It can be very difficult to manage the physical wiring of a ring-connected local-area network. It is also difficult to install or remove a station from the ring without a significant loss of service to the other stations. These considerations can be tolerated, as the number of ring networks in use can testify, but a better approach is needed.

The wire center is an attempt to overcome the physical inconvenience of the ring topology. A wire center is a common location at which connections and bypass relays are located, usually in a compact box, and to which all stations run a pair of cables. The cables form the ring sequence through the connectors of the wire center. Wire centers may be interconnected to form extended rings up to the physical limit of the ring.

By use of strategically located wire centers, a ring topology installation will be significantly simplified. The problem of which stations to cable to is reduced to finding a free connector pair on a wire center. The interruption in service when connecting a new station into the ring will be reduced to the time required for a relay to open. A packet may be lost. Congestion at a wire center can by relieved by simply installing a new wire center nearby and connecting it to the one that is out of connectors. Figure 3 (on Page 50) illustrates a cascade of wire centers. The interconnection of wire centers can extend the physical ring boundaries to a large area while keeping the management of the physical plant a reasonable task.

The rules that determine access to a shared resource are critical determinants of the properties and performance of a network. A local network usually has a physical channel as

"GET IBM 3270, 3780 AND HASP COMMUNICATIONS—ADDING A ONE-BOARD PROCESSOR TO MY PC?"

"YOU CAN WITH PERSYST."

The Persyst DCP/88. The only compatible front end communications processor that can support a range of IBM communications.

It's a Persyst exclusive.

The DCP/88 distributed communications processor. A one-board computer that can be configured by software to handle communications between a PC and another computer system.

In fact, the DCP/88 enables the IBM or TI PC to support a range of sophisticated IBM communications—all with just one processor.

So it gives corporate users unprecedented, low-cost flexibility to incorporate the PC into virtually any environment.

Convert any PC into an IBM 3270 terminal. An IBM 2780/3780 RJE workstation. Or a HASP/RJE workstation—instantly.

Just combine the DCP/88 with Persyst software—and you can connect your PC to any compatible host mainframe or minicomputer.

PC/3270 enables your PC to emulate an IBM 3274 Cluster control unit and 3278 terminal, supporting up to four additional devices. Including a printer and three other PCs functioning as 3278 terminals.

PC/3780 converts your PC into a 2780/3780 remote job entry terminal that can send and receive batch files to and from the host.

And with PC/HASP, your PC instantly becomes a full-function HASP/RJE workstation that can support up to seven input and seven output multi-leaved job streams concurrently.

Capability to support your communications needs now. And in the future.

Because the DCP/88 supports bisync, SDLC, HDLC and async protocols, it is the only communications processor you'll ever have to buy.

Use it to connect your PC to an expanding network of IBM communications. Configure your system to meet virtually any communications need—without adding another piece of hardware. Or expense.

All of which makes the DCP/88 as practical as it is powerful.

The Persyst Coax/3278. Still another way to expand your IBM communications.

Here's another fast way to incorporate the PC into existing SNA or bisync data processing installations.

The Coax/3278. A single-slot expansion board that converts your PC into an IBM 3278 display terminal. And with its high-speed coaxial port, you can connect the PC directly to IBM 3274 or 3276 cluster controllers.

Sophisticated communications products for the corporate user. Insist on Persyst.

Persyst communications products are designed to make corporate information systems more powerful. And more efficient.

Write or call Persyst today for complete information.

THE DCP/88™ BY PERSYST.

Computerworld presents the three most important factors in creating the #1 specialized business publication in the United States:

Factor 1

Great Editorial. When you ask $44 a year for a subscription — the editorial better be worth it. Ours is. Because we hire journalism skills first and computer industry background second. Our writers instinctively recognize the lead in a story. They can smell another story when they haven't even completed the one they're working on. They know how to interview; how to get the source to reveal facts that never were intended to be released.

Factor 2

Great Editorial. Our writers are pros at giving our readers what they need because they go where our readers are. They go to the same seminars, conferences, manufacturers' training programs and trade shows. And they don't just listen with our readers — they listen to them. So our readers get responsive editorial. And they regularly vote *Computerworld* "most useful publication" — both in our own studies and in those done by independent organizations.

Factor 3

Great Editorial. Because *Computerworld's* editorial department is supported by subscription revenue, our writers know who they're working for. They write the stories our readers need to see — independent from our advertising. And our advertisers appreciate our reputation for editorial integrity as much as our readers do.

Editorial. It's the most important factor in developing *Computerworld* as the #1 specialized business publication in the U.S. And you'll find that our sales people know as much about our readers and our marketplace as our writers do. They'll be happy to give you the facts, the numbers and a first-class overview of the marketplace. Just call Don Fagan, Vice President, Sales at 1-617-879-0700.

COMPUTERWORLD

THE NEWSWEEKLY FOR THE COMPUTER COMMUNITY

its lowest level of shared resource. The access rules that determine which station may use the ring have already been mentioned, being either token or contention or buffer insertion. It is helpful to examine the token-access ring in detail since it is being standardized by IEEE-802.

It is important to recognize the difference between token passing on a bus, such as the IEEE-802.4 protocol, and token access on a ring. A logical sequence is created on a physical bus, and the token is an explicit message that must pass from one station to the next for each station in the sequence. The overhead — which is not usually much — for each station to receive and retransmit the message is always present on a token bus.

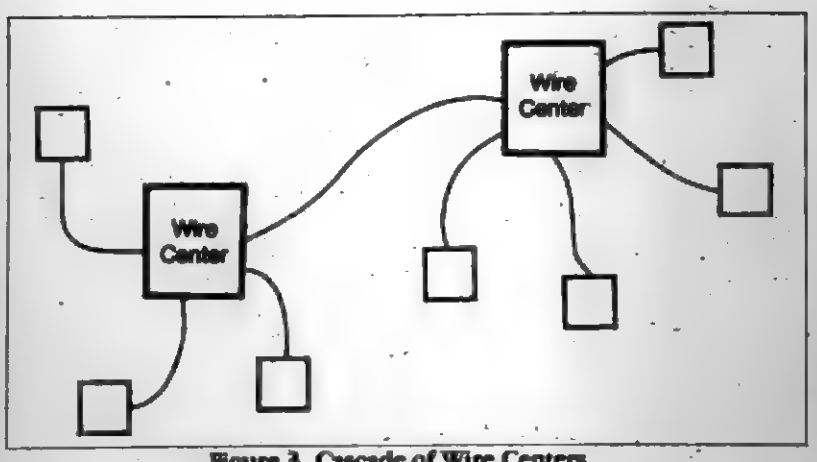

Figure 3. Cascade of Wire Centers

On a ring, the token is associated with a circulating packet and can be ignored by stations with no traffic to send. It might have been desirable to have had different terms to describe the two types of tokens, but the usage appears to be embedded by this time.

The use of the token on a ring as a means for access control occurs as follows. A station on the ring with a packet to send will monitor the data it detects passing on the ring until a sequence that it recognizes as a token appears. It converts the token to a connector, usually by inverting one bit. It sends its packet, concatenated with the connector, to another station on the ring. The station listens for the connector to come back around and converts it back into a token. The next station with traffic to send that recognizes the token may send its packet.

The station that sent the packet has no way of knowing if it was received correctly unless it can check what comes back around the ring for a correct frame check sequence and acknowledgment from receiving station that the packet was copied. The IEEE-802.5 standard explicitly provides an acknowledgement field at the end of the packet that the receiving station must modify as it retransmits the packet.

One bit indicates that the packet was or was not received with correct frame check sequence. A second bit indicates that the receiving station did or did not have a buffer available in which to store the packet. Thus, the sending station would know whether or not to retransmit the packet.

The station that is sending the packet could have a second packet to send already in the queue when it sent the first one. It could simply leave the token bit asserted and transmit the second packet immediately and a third frame and so on until the queue is empty. This mode of operation is called exhaustive transmission. It has the advantage to the sending station that very high throughput can be sustained once the token has been seized.

It has the disadvantage to the rest of the stations that an indeterminate time may elapse before the first station exhausts whatever process is supplying packets and passes the token. The IEEE-802.5 standard allows the transmission of multiple packets.

The IEEE-802 Local Network Standards Committee has drafted a standard for local-area networks that incorporates several different approaches to topology and access control. These approaches include carrier-sense multiple access with collision detection on a baseband bus (Ethernet), a token-passing bus that can be employed on either a baseband or broadband bus and a token ring definition. The latter, incorporated in section 802.5 of the standard, is widely regarded as IBM's choice. This is due to the fact that the IBM contributions to the work of the committee dominate the 802.5 definition, and IBM has publicly supported the token ring as a local network form. However, IBM has not announced any products that include the 802.5 ring, and the firm's spokesmen have refused to state any commitment to it. Time will tell. ■

Mom files best.

Introducing PC/COM.™ Truly, the fastest, easiest way to manage information today.

When MOM™ says she has a software system that can manage information faster than anything else on the market, believe it.

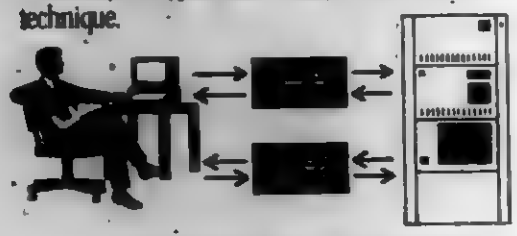
It's called PC/COM. A revolutionary automatic file transfer and management system that opens up a whole new realm of opportunities to PCs and PC-users.

Your mainframe works faster with PC/COM. Your PC gets more file management features.

If you are a mainframe user of TSO, CMS, or CICS, PC/COM will prove invaluable.

MOM says any job worth doing is worth doing fast.

MOM's PC/COM manages information at an incredible speed. And PC/COM will handle just about any file type with its unique binary transfer technique.

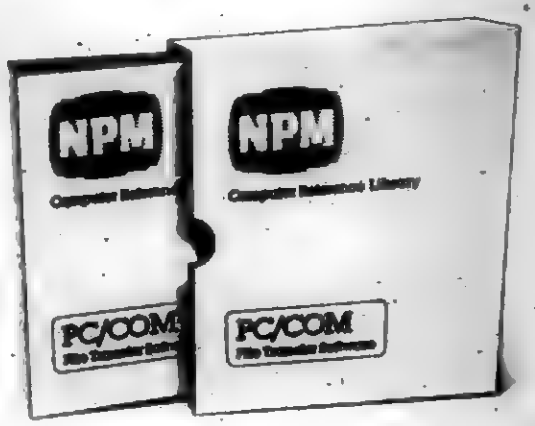


You can even back-up your hard disk on the mainframe. Leave it parked there until you need it. All it takes is the press of a key to get it moving again.

PC/COM is bi-directional, to save time getting information out of the mainframe onto your desk. And vice versa.

Security conscious, private and flexible — that's MOM.

The PC/COM has file access control and security built right in. So only those parts of the mainframe that should be accessed, are.



PC/COM is user-friendly and menu-driven so it's easy to understand. And simple to operate. All the features (and believe you, MOM, there are plenty) are initiated by a single function key.

Call MOM. 1-800-241-1170.

Talk to MOM. Tell her what you have and what you need. Ask her any questions about PC/COM and get good, clear answers.

MOM wants you to understand what you're getting into with PC/COM — and how much you can get out of owning the best, and fastest, file transfer and management system on the market.

The revolutionary PC/COM. Of course, from MOM. Phone 1-800-241-1170 or 404-351-2902.

Special Section: Local-Area Networks

CHARTING THE WATERS

By Michael J. Zak

In recent years, many local-area network products have appeared. Vendors have promoted these products based on the performance benefits available from local-area network technology. Typical customers have been early adopters, tending to be technically adept and appreciative of the performance benefits that are inherent in local-area network technology. ▶

Zak is director of market planning, Network Control Products Division, Codex Corp., Mansfield, Mass.

A LONG, DRAWN EXPLANATION OF THE DCA

There is hope for potential local net users who are trying to find a way out of the confusion reigning in the market. Network selection can be made much easier by doing some preparation before meeting with vendors.

At the same time, a great deal of confusing activity has occurred among standards bodies. Debates have raged over the peculiarities of one access method vs. another or one transmission media vs. another. In addition, many questions have arisen. Which access method is best — carrier sense multiple access with collision detection (CSMA/CD) or token passing? Should a local-area network system employ a broadband cable plant or should the system use baseband techniques?

Vendors, early adopters and standards bodies have focused on the above issues, and as a result, discussion has been drawn away from critical issues that will determine whether or not local-area networks are accepted by users. Local-area networks must be shown to solve real-world user problems in order for their user base to grow.

THERE IS HOPE for potential local-area network users who are trying to find a way out of the confusion reigning in the market. Network selection can be made much easier by doing some preparation before meeting with vendors that have vested interests in specific technologies.

In this preparation, the user's objective should be to understand the scope of the problem he wants to solve and to use those boundary conditions in dealing with vendors. Because users often need to solve a current problem with a solution that has the flexibility to respond to growth and change in the user environment, an effort should be made to define today's problem and to predict tomorrow's problem.

Two types of problems tend to crop up in local data communications. The first type of problem can be labeled physical and includes such specific difficulties as:

- The need to provide connectivity so users can gain access to multiple applications from a single display terminal;
- The proliferation of cabling and the resultant space and cable labeling problems, which are especially relevant in user environments where terminals are moved often;
- The limitations on terminal and CPU driving distances and the need to incur additional costs to extend driving distances;
- The need for increased transmission speeds in order to handle applications that require high speeds, such as peripheral sharing and communications via transferring of files;
- The interconnecton of geographically dispersed local-area networks via wide-area network facilities;
- The management of the physical inventory, maintenance and financial status of equipment within the local-area network;
- The need to perform troubleshooting and diagnostics on the physical components of the local-area net.

The preceding list includes the most basic problems that a data network manager who has significant local data communications responsibilities must confront. Even though these problems are quite common, there are few easy solutions.

In the synchronous world of IBM and IBM-compatible cluster controllers and display heads, there remains the requirement to lay in separate runs of coaxial cable for each display head.

In the world of asynchronous communications typical of minicomputers, dumb and smart terminals, the data private branch exchange (PBX) offers a reprieve from some of the problems stated above. If local data communications problems were exclusively physical and if data communications consisted solely of asynchronous communications between Ascii terminals and minicomputers, the data PBX might be an adequate solution to the local-area net problem.

Logical problems come to the fore after the network manager has solved the physical problems. While physical problems aggravate the network manager, the logical problem usually afflicts the network user.

The second problem that afflicts data network managers can be called a logical problem. Logical problems come to the fore after the network manager has solved the physical problems. While physical problems aggravate the network manager, the logical problem usually afflicts the network user. Specific examples of logical problems are:

- How can a user, employing terminal equipment and applications that are unique to a given vendor's proprietary architecture, gain access to applications and data bases that are unique to another vendor's proprietary architecture?
- How can network availability be guaranteed?
- How can system loading and system capacity be managed to ensure minimum response times?

A local-area network problem is complex and hard to define. Physical problems tend to be evident today, but the logical problems are just beginning to emerge. The essence of the buyer's challenge is to define today's physical problem, outline tomorrow's logical problem and then choose a vendor that solves today's problem.

A few hints are helpful for users engaged in problem definition. First, avoid the jargon that has afflicted the local-area network industry. Do not express a requirement for Xerox Corp.'s Ethernet or a broadband system because of all the bandwidth it will handle. Instead, define your application and force the vendor to do his job — to demonstrate to you that his product solves your problem.

Finally, do not hesitate to call in one or two vendors to use their applications engineering expertise to help solve the problem. Using vendor expertise in the early stages of problem definition is a low-risk way to gain valuable insight into a vendor's commitment and capabilities in the local-area network business.

In searching for a vendor, establish priority problems for the local-area network system to solve.

OUT
DATA NETWORK.

It's really very simple: A DCA network can integrate all your datacomm equipment—IBM or non-IBM—into one flexible, efficient system. We call it Integrated Network Architecture (INA). And it offers many remarkable advantages.

Like network transparency. Our hardware is compatible with all hosts and terminals —synchronous or asynchronous. So you're free to use less expensive async terminals and modems.

Host selection: With INA, any async terminal in the network can access any host in the network. Including IBM hosts, packet mode hosts and public data networks. And any 327X terminal can access any host running 3270 BSC.

High speed transmission: You can transmit combined voice and data at speeds up to 1.544 MBPS.

Modular hardware: You can upgrade and expand your network simply by adding—instead of replacing—low-cost DCA components.

And since data is routed through a network processor instead of a dedicated host, no host software is involved and no extensive programmer training is required.

Simplicity. Flexibility. Efficiency. Savings. Chalk them up to INA. From DCA, 303 Research Drive, Norcross, Georgia 30092. Call us toll-free: 1-800-241-5793.

Digital Communications Associates, Inc.
DCA Products Are Available Worldwide.

The failure to establish priorities for product capabilities, thereby stating an implicit unwillingness to compromise, suggests that the only viable course for a user is to contract a custom local-area network, with its attendant costs and the difficulties of supporting nonstandard products.

The required local-area network solution can be outlined in many ways. Once the user makes the distinction between physical and logical problems, he can relate the two generic problems to his applications environment. For example, a network manager might legitimately consider a local-area network because he has a lack of space for additional cabling to support terminal-to-CPU traffic. This physical problem might dictate a fundamentally different solution than that required for a logical problem such as resolving protocol incompatibility.

In evaluating solutions for local data communications problems, the network manager should assess speed and performance, flexibility, security and cost. These items should be included in a statement detailing the problems a vendor is required to solve.

Having prepared a definition of the local communications problem, the user then proceeds to evaluate the alternatives available for solving the problem. This evaluation should entail far more than a review of products. It should also include an evaluation of the vendors that provide the products.

Astute users will assess a vendor's motivation for being in the local-area network business. If the vendor's traditional business has been the sale of CPUs, does the local-area network offer communications services to hardware manufactured by other vendors? Often, local-area networks offered by CPU vendors support only the proprietary communications architectures of that vendor. In the ideal case, the local-area network vendor should be motivated by a desire to solve the general communications problems of the user. It is critical for the vendor to show that he solves today's problems with his current product and that he has a strategy that will address tomorrow's problems. ■

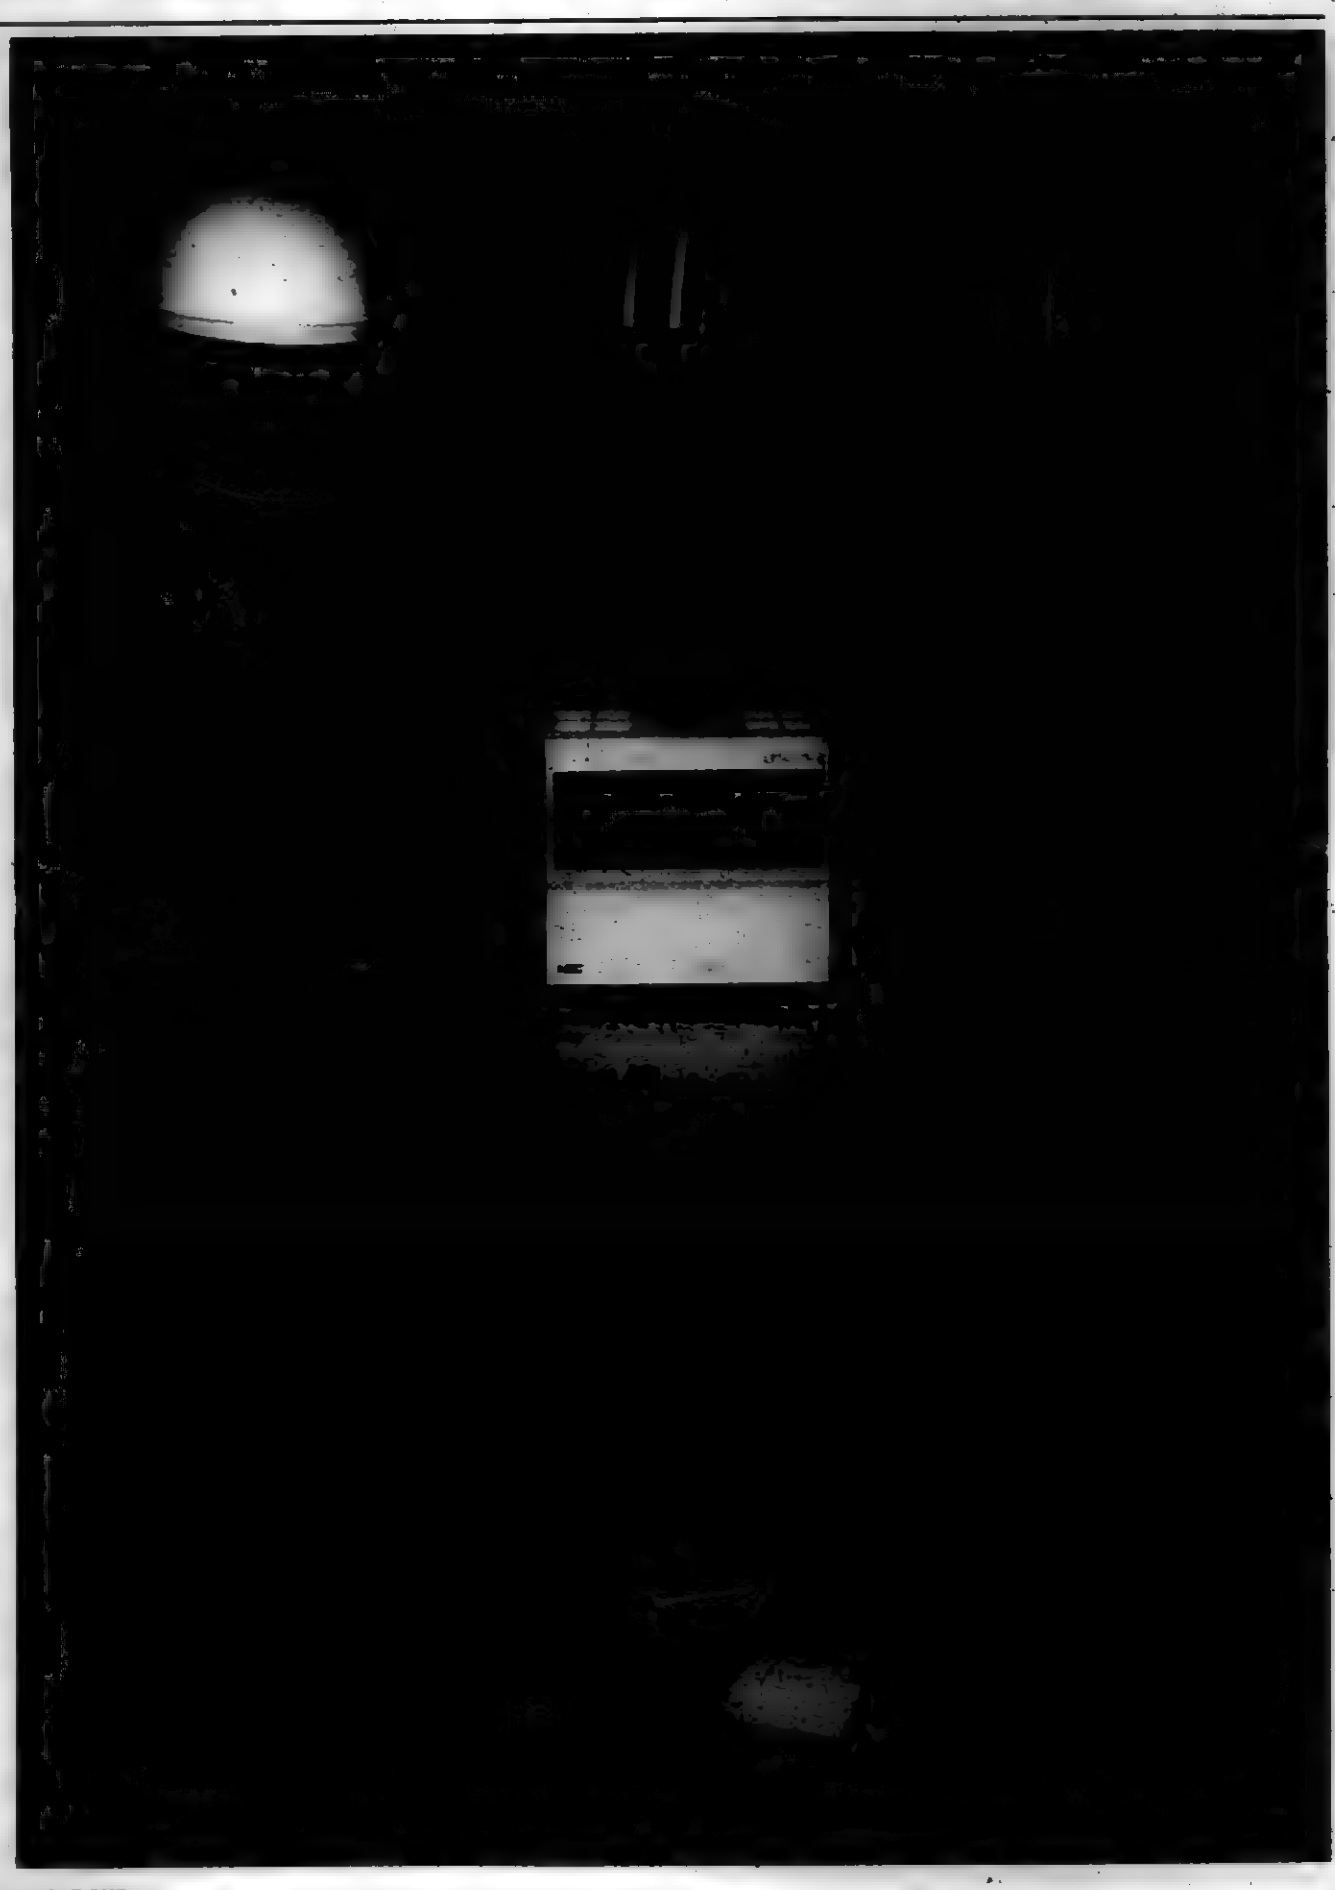
Data Communications Products



Rolm Corp. rigorously defines the computer and communications industry's rampant one-upsmanship. "One of the keys to our business strategy is to try to see new market opportunities before they get noticed by the general herd," Rolm's executive vice-president and co-founder Robert Maxfield explained.

"Rather than provide products that are merely plug-compatible with someone else's, we like to find a problem that other people don't know exists yet and then be the first ones to solve it," Maxfield said.

Baxter is West Coast bureau chief for Computerworld.

Maxfield is the company's penchant for finding new technological and market ground more closely dominated than in its recent exploits in the private branch exchange (PBX) arena. Rolm's debut as a PBX supplier came in 1975 with the introduction of the Computerized Branch Exchange (CBX), a real-time switching system that could serve as the hub of a corporation's voice communications network.

But though its initial foray into the business communications field proved to be a huge commercial success, the firm quickly became restive. Within about a year or so, ▶

Rolm's executives and engineers were already hankering to exploit their newly won market advantage by enhancing their existing PBX to support data as well as voice communications.

The aim behind the suggested product upgrade was to address the then-emerging problem of how to enable the business world's growing hodgepodge of incompatible terminals and other data devices to communicate with each other. Rolm's proposed solution was to centralize all the necessary protocol conversion and other data-switching capabilities in a customer's PBX and then allow users to contend for communications resources. Such an arrangement, the company reasoned, would minimize transmission costs through resource sharing, allow data to be exchanged over existing telephone cables and provide computerized office equipment with the same level of universal connectivity that had long characterized telephony.

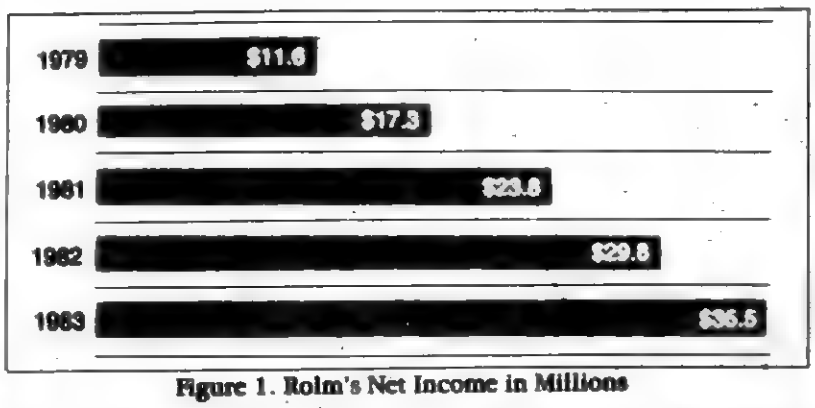


Figure 1. Rolm's Net Income in Millions

At the moment of its conception, the notion of combining voice- and data-switching capabilities in a single box proved to be about five years ahead of its time — a fact that forced Rolm to postpone the announcement of its enhanced CBX. By early 1981, the problem of interconnecting diverse models of office equipment had received enough widespread user attention to convince Rolm that its integrated voice and data PBX was finally ready for formal introduction.

But even though the product's release was significantly delayed, the company still ranked among the first PBX vendors to add data communications support to its existing real-time voice capabilities. Only archcompetitor Northern Telecom, Inc. rivaled Rolm for the honor of perfecting the industry's first combined voice and data switching system, Maxfield recalled.

Since then, Rolm has substantially broadened the scope of its communications business to encompass many of the desktop data devices and applications that a central switching system supports. Some of those data communications accessories and software packages include Cypress, a combination display terminal and digital telephone, and Phone Mail, a computerized system that takes, forwards and distributes messages.

Rolm's long-standing participation in the integrated voice and data switching market and its subsequent expansion into the automated office equipment field graphically illustrate one of the key tenets of the company's guiding management philosophy: Commercial success lies in carefully identifying selected business opportunities and then doggedly pursuing those target markets through good times and bad.

Unlike some of its main rivals, whose business interests span nearly the full spectrum of communications products and services, Rolm deliberately restricts its focus to just one narrowly defined specialty — business communications. "We have consciously avoided participating in the central office and carrier equipment field," marketing vice-president Richard Moley said. "Nor are we interested in making stand-alone kinds of office products that exist outside the context of PBX systems. We would obviously be foolish at this late date to try to compete in stand-alone word processing with companies like Wang [Laboratories, Inc.], which is already well-entrenched in that field."

Rolm's strong emphasis on business communications is reflected in the breakdowns in the company's latest sales figures. Only about nine years after its debut in the voice communications arena, PBX and office accessories sales already account for roughly 85% of the firm's total revenues. The balance of Rolm's business comes from the sale of ruggedized military computers, the products that gave Rolm its corporate start.

The combination of judicious market selection, strict adherence to a preset business course and a corporate culture that stresses

NETWORKING UNRAVELED FOR YOU!

Technology Transfer Institute's Seminars by
THE EXPERTS ON NETWORKS

It might seem as though the technology for configuring networks these days has become a real nightmare. The truth is that the maze of choices simply needs to be put in the proper perspective. Should you use satellites, phone lines, public or private networks, value-added networks, broadband, baseband, fiber optics, all or some, and in what configuration? The list goes on and on. Besides the options, the jargon is enough to drive you crazy — LANS, MANS, VANS, X. this, X. that and who knows what else, not to mention keeping track of the emerging standards.

To assist you in putting all of these network technologies in their proper perspective, Technology Transfer Institute has assembled an amazing set of Network Pioneers to conduct the Spring '84 series of NO-NONSENSE SEMINARS.

TTI'S line-up of "EXPERTS ON NETWORKS" will help you unravel your networking dilemmas, be it performance, evaluation, queueing, protocols, configuration, planning or architectural concerns.

To get all the facts on the TTI seminars, give us a call or send the coupon today for your Spring '84 catalogue of network courses. Discover why TTI seminars continue to be "the standard in the field against which all others are measured."

technological trailblazing rather than copycatting has stood Rolm in remarkably good stead. Between 1979 and 1982, the company's combined revenues more than tripled from $121 million to $380.6 million. In 1983, sales rose an additional 32% to top the half-billion-dollar mark for the first time in the corporation's history, and for the first six months of fiscal 1984, revenues jumped again to $288 million. In addition, the firm's impressive net income and shareholders' equity figures are shown in Figures 1 and 2.

Rolm's steadily expanding sales mirror its growing participation in the PBX field, where the company currently holds an estimated 15% market share, second only to industry behemoth AT&T. The smaller of the two firms also claims to control possibly the largest installed base of data-switching products in the U.S.

In fact, the vendor's latest commercial ventures have proven so successful that they recently attracted the notice of none other than IBM, which last summer bought 15% of Rolm's common stock and since then has acquired an additional 5%. Under the minority-purchase agreement, IBM can exercise its option to boost its interest in the business communications company to a maximum of 30%.

For Rolm, the benefits of the newfound relationship with Big Blue are manifold. For one thing, the partnership seems almost certain to ensure a high level of connectability among IBM's future hardware modules and Rolm's PBXs, Maxfield predicted. In addition, the accord is expected to promote the development of widely accepted interfacing standards that may eventually enable a broad assortment of competing data devices to communicate with each other.

A second major advantage of the IBM-Rolm union is that it significantly enhances the communications company's presence in markets abroad, Maxfield said. At present, international sales account for only about 5% of the firm's overall annual revenues. Except for an installed base consisting of 25 to 30 PBXs in Japan, Rolm's penetration of the potentially lucrative foreign market is restricted to a relatively modest number of customer sites in Italy, Latin America and Korea. The supplier also boasts a joint venture in Mexico.

In the future, however, Rolm expects an increasingly hefty percentage of its total voice and data communications business to come from overseas. "We definitely have ambitions to be a worldwide supplier," Moley said.

IBM's minority position in Rolm is further expected to benefit the smaller firm by substantially magnifying its credibility in the eyes of current and prospective customers, especially large national accounts. Until recently, when major U.S. corporations were pondering the acquisition of a centralized voice- or data-switching system, Rolm often

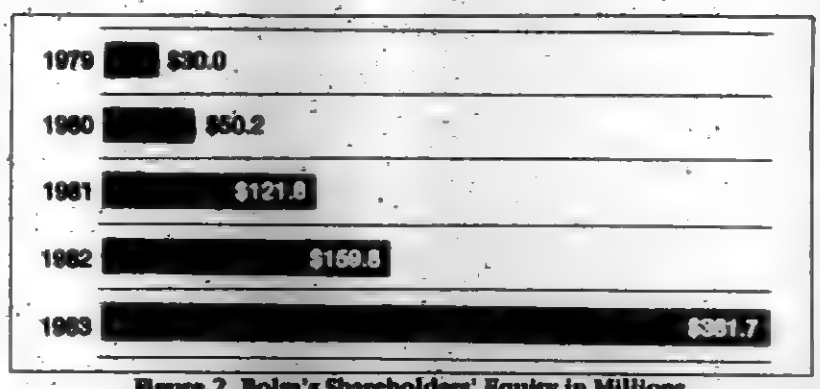

Figure 2. Rolm's Shareholders' Equity in Millions

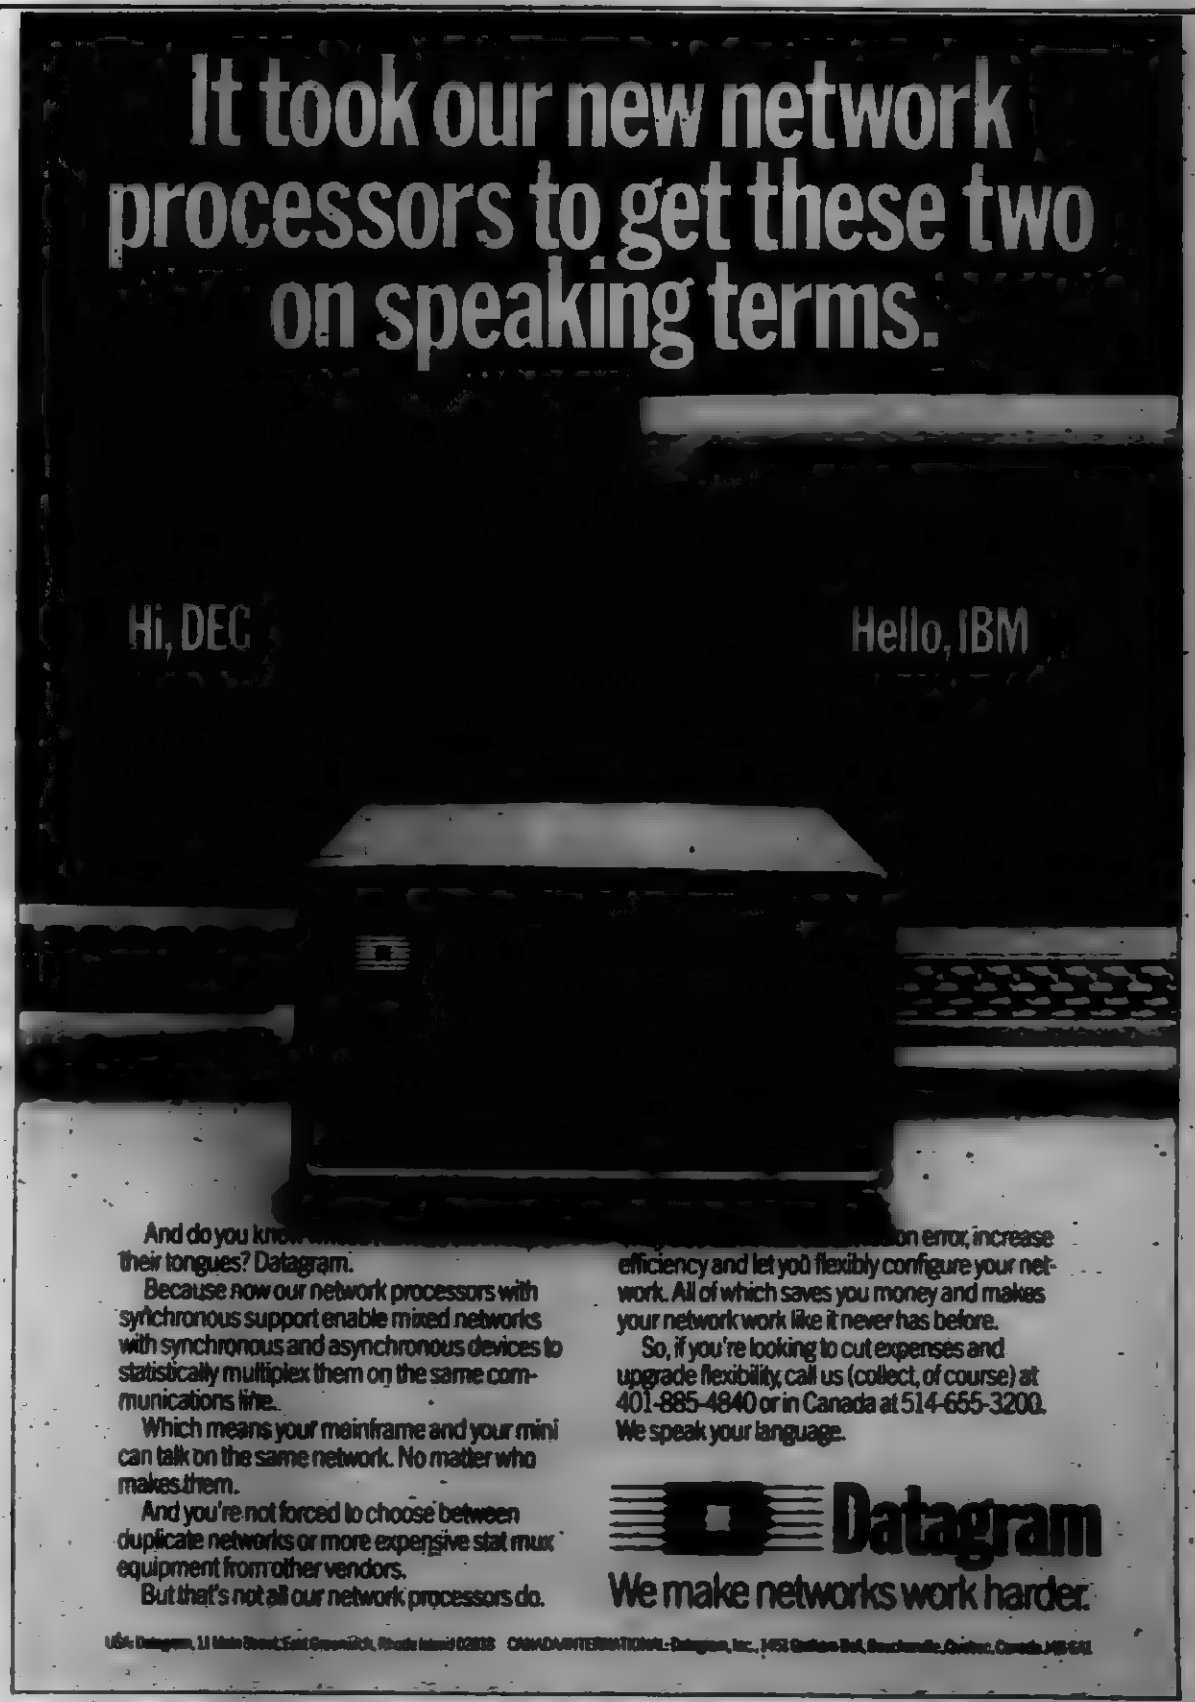
fared badly in comparison to established communications giants like AT&T, Northern Telecom and the large Japanese manufacturers. The problem had less to do with shortcomings in the company's products than with serious misgivings about the long-term viability of the vendor itself.

"As you move higher and higher into customer organizations, the issue of vendor survivability becomes increasingly important," according to Bill Warren, a product manager responsible for the telephone and voice-switching side of Rolm's telecommunications business. "So even though we currently have annual revenues exceeding $500 million, we still may look relatively paltry compared to AT&T and the Japanese."

But now, in the wake of Rolm's newly forged alliance with IBM, doubts about the communications company's market staying power are rapidly disappearing.

"Suddenly, [the association with IBM] has made us the safe buy, particularly in view of the recent Bell breakup" and its resulting industry disarray, Janice Carnes, a product manager for the



DATAPOINT
We sparked the revolution.

Seven years ago, when DATAPOINT introduced the world's first local area network, ARC® (Attached Resource Computer), we sparked a revolution in business communications. Today, DATAPOINT's comprehensive approach to office automation, communications, dispersed data processing and desktop computing continues to make major demands on software technology. DATAPOINT is the undisputed leader with more than 5,000 ARC® local area networks installed...more than all the others!

SUPPORT ANALYSTS
Your team will be the key in support of office applications such as WP, mail and multiplan. You will also be involved in reviewing of specifications and documentation for support of those applications.

OPERATING SYSTEMS PROGRAMMERS
From a creative point of view, you will design and implement current as well as future operating systems and utilities. You will need knowledge of Assembly, Pascal and "C".

OFFICE AUTOMATION PROGRAMMERS
You will be a part of a highly skilled professional team developing the office of the future - stressing reliability and user friendliness. Programming experience using high level "C" and similar languages, and interactive software tools is desired.

SOFTWARE QUALITY ANALYSTS
Join a team that has high visibility in our quality-conscious organization. These positions involve systems test, analysis, planning, and development as well as software performance analysis and testing.

DOCUMENTATION WRITERS
We are looking for proven communicators with skills in operating systems, languages, communications, and office applications. End-user documentation experience preferred. Knowledge of on-line documentation, "Help" facilities, and other user aids helpful.

FILE MANAGEMENT & LANGUAGES DEVELOPMENT PROGRAMMERS
Operating Systems, DBMS, or language development in assembly language is required for this advanced team of software professionals. Experience in using "C" language or Pascal is a plus.

GROWTH and success!

data-switching side of Rolm's operations, maintained.

FOUNDED IN 1969, Rolm derives its unusual moniker from the first letters of the last names of its four co-founders — Gene Richardson, Ken Oshman, Walter Loewenstern and Maxfield, all graduates of Rice University. For roughly the first six years of its corporate existence, the company devoted its energies exclusively to manufacturing and selling military-oriented computers capable of withstanding severe temperatures and other hostile operating conditions.

In 1975, the firm entered the second phase of its organizational evolution when it diversified its product line with the introduction of the CBX. Since then, Rolm has steadily broadened its switching systems line to include a wide assortment of additional CBXs, ranging from very small to very large models. Last November, the company further enhanced its PBX family with the announcement of its CBX II, a second-generation digital communications system.

Today, Rolm consists of two main business entities — the Mil-Spec Computer Division, which supplies the ruggedized military computers, and the Business Communications Division, which came into existence with the advent of the firm's first PBX. The Business Communications Division, in turn, embraces two main product disciplines: telecommunications and automated office systems.

Unlike the telecommunications group, which specializes in providing PBXs and digital as well as analog telephones, the office equipment organization focuses on the development of applications and desktop data devices that complement the corporation's switching system technology.

Within the Business Communications Division also lie two of Rolm's other major commercial operations — its international telecommunications and industry systems groups. The international telecommunications organization concentrates primarily on tailoring the company's U.S.-made PBXs to foreign specifications and then selling the products to customers abroad. The industry systems group, meanwhile, aims to maximize the firm's penetration in selected end-user markets like health care and hotel management.

Rolm currently employs about 7,600 people, more than 3,000 of which are ensconced in the fountain-studded, garden-like setting of the company's Santa Clara, Calif., international headquarters complex.

As Rolm's work force and the extent of its commercial activities have steadily expanded during the past 15 years, many of the company's methods of doing business have slowly, but profoundly changed.

Only three or four years ago, "customers looked on PBXs as just another utility," Warren recalled. "Buying a PBX was like ordering a coffee pot." The result was that PBXs were typically bought by telephony managers, who usually based their product selections on one simple criterion — line costs.

But today, the picture is rapidly changing. With PBXs increasingly being regarded as components of a user organization's overall information system, Rolm is selling a growing number of its products to management information systems directors and vice-presidents of finance rather than to telephony managers.

That shift in the composition of its customer population, in turn, is forcing the firm to revise its selling tactics to stress expandability features and functions instead of costs per line.

Within large corporations, PBX buying decisions are fast acquiring the same degree of strategic significance as the acquisition of a central mainframe — a development that has prompted Rolm to upgrade its sales pitches accordingly, Carnes said.

LOOKING AHEAD TO the future, Maxfield foresees a continuation of his firm's past business successes, but is wary of of the potential dangers of managing rapid corporate growth. "Our strategies, opportunities and current market positions are winners," he said. "But no matter how good they are, all our plans still have to be implemented, which is always a challenge.

"And implementation ultimately boils down to people and to our ability to manage them effectively and develop them professionally," he added.

To a limited extent at least, Rolm's long-term financial outlook also hinges on future directions within AT&T, its prime competitor. If the newly divested communications giant elects to cross-subsidize the unregulated part of its business with revenues from its long-line monopoly, Rolm and other PBX suppliers may find themselves hard-pressed to compete, Moley said.

But in the absence of such unfair business practices, the company expresses confidence in its ability to continue meeting AT&T's formidable market challenge. "The office automation and computer business is highly dynamic and is an environment where you have to be very fast on your feet to survive," Moley said. "We're accustomed to competing in that kind of environment. AT&T, on the other hand, is a huge company where the top management is utility-oriented and is used to an environment where your investment lasts a long time and yields a guaranteed return." ■

THE RISE OF WORKSTATION TELEPHONES

A new type of workstation is emerging that could strongly challenge the personal computer in the battle for managers' desks. The computerphone offers blended telephone and personal computer functions, resulting in a machine optimized for communications. Examples of first-wave computerphones include Northern Telecom, Inc.'s Displayphone; Rolm Corp.'s Cypress; Cygnet Technologies Corp.'s Cosystem; and Zaisan's ES.1. By year-end 1988, 1½ to two million computerphones could be installed in the U.S.

The computerphone's major thrust is toward access above all other functions. This distinguishes it from the applications-oriented personal computers. The computerphone's networking specialization makes it suitable for the daily activity of higher [illegible] managers and executives [illegible] of data [illegible] information and ideas for [illegible] messages [illegible] And they spend [illegible] of their day dealing with [illegible] of the telephone — looking up numbers, dialing or talking on the telephone.

Telephony is moving into a new era, with next-generation private branch exchanges (PBX) pushing a range of special features out to the telephone instrument. These PBXs — for example, Rolm's CBX II; Ztel, Inc.'s PBX; and CXC Corp.'s Rose — promise to switch data in addition to voice, radically altering the telephone's office role. They will also dispense applications to user workstations including data base and other executive functions.

These two factors — managerial and executive focus in communications and the coming of high-tech telephony — are expected to unleash the computerphone market over the next three years.

Several elements are basic to the computerphone's function. The first is telephone capability, including numerical dial from screen and other advanced telephone functions. Basic computerphones are equivalent to full-feature electronic telephones and are capable of plugging into any analog PBX line. In the future, computerphones will be closely linked with third- and fourth-generation digital PBXs and will be able to exchange data and voice using the switches' proprietary digital signaling techniques.

The computerphone includes two keyboards — a function key dashboard and a standard alphanumeric keyboard. In addition, it includes a CRT and enough intelligence and memory to compose and store directories and short messages. ▶

Colony is president, Forrester Research, Inc., Cambridge, Mass.

Workstation Telephones

The computerphone market can be divided into three segments. These are:

- *PBX proprietary computerphones*, which are designed to hang off a specific PBX;
- *Stand-alone computerphones*, which can attach to any telephone line or PBX;
- *Personal computer add-ons*, with the computerphone function added to a personal computer.

The PBX proprietary computerphone is sold as part of a complete telephone system. Examples include Rolm's Cypress and Northern Telecom's SL-1 Displayphone. These machines are differentiated from the stand-alone computerphone in that they are protocol- and software-compatible with a specific PBX. Three types of protocols apply: voice signaling, data signaling and feature access.

Advanced PBX computerphones have several distinguishing features. They offer one wire set connectivity. One twisted pair carries interleaved voice and data between the PBX and the computerphone. They also support high-speed communications. PBX computerphones signal to the PBX at 56K or 64K bit/sec. In the future, speeds in the 1M bit/sec range will be supported. In addition, these PBX propriety units offer easy access to a broad range of telephone functions.

Rolm, AT&T Information Systems, Northern Telecom and Mitel Corp. are the budding players in the PBX computerphone segment of the market. Rolm and Northern Telecom perceive the computerphone to be an important future business. Rolm estimates that Cypress I and Cypress II, which is still unannounced, could generate between $35 million and $50 million in revenues in 1985 and double that amount in 1986. AT&T Information Systems may position the business communications terminal as a personal computer alternative in 1984.

One major disadvantage of the PBX computerphone is its all-or-nothing implementation. Users must install specific types of PBXs to run the PBX computerphones. This makes the PBX computerphone tough to pilot — an important evaluation method used by large companies.

Figure 1. Outlook for PBX Proprietary Units

THE SECOND TYPE OF computerphone, the stand-alone unit, can attach to any analog telephone line — PBX, Centrex, keyset or single-line. Important stand-alone machines include Northern Telecom's Displayphone, Zaisan's ES.1, Mitel's Kontact workstation and Ambi Corp.'s Ambiset.

An important distinction between the stand-alone computerphone and the PBX computerphone is the level of telephone function supported. The PBX computerphone will be attached to one digital line in the future, and it will be software- and function-compatible with the PBX. For example, when the call-forwarding button is pushed, the PBX computerphone will interact with the PBX's call-forwarding software using a specialized digital management protocol. The stand-alone computerphone can access some PBX functions using dual-tone multifrequency and flash, which is quick switch-hook depression.

The primary advantage of the stand-alone unit is its ability to fit into any office environment regardless of the level of telephone service offered. About 97% of telephone lines installed in the U.S. at year-end 1983 were analog, a large universe of potential installations for stand-alone computerphones.

Looking ahead to 1988, there will still be an extremely large universe of nonproprietary telephone lines, representing the potential market for stand-alone computerphones.

Finally, the definitive for reaching today's – data communications

It's called ANI℠—Advanced Network Integration. From Infotron.

ANI is a definitive path for network growth and management that's reflected in a family of data communications products and services.

It gives you something you haven't had before—the means to plan and implement a data communications network based on long-term strategy.

ANI covers everything we make—from simple modems to stat muxes, to high-speed muxes, to network concentrators, to intelligent data switching systems.

ANI also includes everything we do. Systems engineering, from technical support to turnkey operations. Installation. Training. Telephone consultation and dialup online diagnostics. And worldwide field service.

Growth.
ANI products grow with you.

They're based on an architecture that's simple to expand and upgrade.

Because ANI products can be expanded both in size and function, they're easily integrated into larger, more complex networks. They grow with you instead of becoming obsolete.

Flexibility.
ANI products are versatile.

They can accommodate computers and terminals with almost any combination of protocols and speeds.

And because of their modular structure, ANI products will accommodate bridges to other networks, and gateways to public and private resources.

A THIRD TYPE OF computerphone that is closely linked with personal computers has emerged. This group includes Cygnet's Cosystem, which adds computerphone functions to the IBM Personal Computer. The major appeal of the personal computer add-on unit lies in its ease of implementation. No corporate workstation standards are violated by this type of machine. And with the add-on unit, users do not have to learn new interfaces, keyboards or routines.

In addition, this type of computerphone builds off the already accepted personal computer; no major internal selling program is necessary.

Figure 2. Outlook for Stand-Alone Units

In preparation for a recent report on computerphones, Forrester Research, Inc., a research firm based in Cambridge, Mass., surveyed office automation and management information systems planners within 25 Fortune 1,000 companies. Few of the users had computerphones installed in their companies. However, the concept excited respondents. A typical comment was: "The computerphone will be the way we take automation to vice-presidents and general managers. That level of personnel doesn't want clunky personal computers with spreadsheets."

While the general idea of telephony automation made sense, real application of the machines was difficult for users to envision. One respondent stated this ambiguity well: "Before we begin to install the computerphone, I don't think we can know how we'll use it."

Much of the sample saw the computerphone as a means of communicating with internal and external data bases. The respondents mentioned sales records, IBM's professional office system, decision support systems, electronic messaging systems, Digital Equipment Corp.'s Datatsieve and Wang Laboratories, Inc.'s Alliance, among others.

Other results of the survey are listed below:

- Telecommunications management within the companies is expected to oversee computerphone purchase and installation. This reflects the machine's close association with the PBX.
- The computerphone must be relatively inexpensive. Most users believed that it should cost between $700 and $900.
- Personal computers and computerphones must be linked. The capability to move messages, spreadsheets and other information between personal computers and computerphones was important.
- Users expect to install large numbers of computerphones over the next five years. The average number of telephone lines with computerphones was expected to be approximately 35% of all installed telephone lines by 1988.
- The computerphone was seen as a replacement system. Survey respondents saw the computerphone as a means for replacing several diverse terminal types. These types include telephones, Ascii asynchronous terminals, IBM 3270-type terminals and personal computers. This multifunctionality will be an important means of cost justifying the computerphone.

To date, the computerphone has posed little threat to the personal computer. At year-end 1983, there were approximately 15,000 computerphones installed in the U.S.

Of that number, 10,000 were Northern Telecom Displayphones, 1,200 were Davox Communications Corp.'s Desksets, 1,000 were Mitel Kontacts, 1,500 were GTE Corp.'s or Tymnet, Inc.'s Action Stations and 1,200 were others. Shipments will increase modestly in 1984, with approximately 20,000 placed in the U.S. Of these, 65% will be stand-alone models, which is a reflection of the paucity of third-generation, fully digital PBXs.

The inflection point in the

path and tomorrow's objectives.

Management.
Management and control are vital to the operation of large, widely-dispersed networks.

ANI products give you the tools for monitoring activities, gathering statistics and keeping informed of events as they occur. From a central point, networks can be configured to meet changing requirements and provide diagnostics for solving problems.

Regardless of network size or complexity, ANI provides complete accountability for network operation.

Infotron communications networking. First in performance and reliability.

computerphone market is expected to come in the 1985 to 1986 time frame. In that period, Rolm, AT&T Information Systems, Northern Telecom and Mitel will be heavily marketing the computerphone. A number of new challengers may have entered the market including IBM, Wang, Hewlett-Packard Co., NEC America, Inc., Hitachi Ltd. and DEC. The computerphone will be a market requirement for PBX vendors, drawing in Ztel, Intecom, Inc. and other switch makers.

By year-end 1986, 600,000 machines will be installed. The population could grow to between 1.8 million to two million by 1988. This represents a penetration of 4% to 6% PBX and Centrex lines.

Stand-alone computerphones will lead the market through 1987. This reflects the limited availability of digital third- and fourth-generation PBX lines. But PBX computerphones will overtake stand-alone models and grow to dominate the market by year-end 1988 (see Figures 1 and 2). This hegemony will derive from the close linking of the computerphone and advanced PBX functions such as messaging and protocol and applications bridging.

In addition, personal computer add-on units will experience steady growth through 1988. By year-end 1988, 460,000 personal computer add-ons, or 2.3% of total U.S. personal computer installations, will be installed (see Figure 3). By year-end 1988, 60% of computerphones will be attached to proprietary PBX lines, and 40% will be attached to nonproprietary dual-tone multifrequency lines.

Figure 3. Outlook for Personal Computer Add-Ons

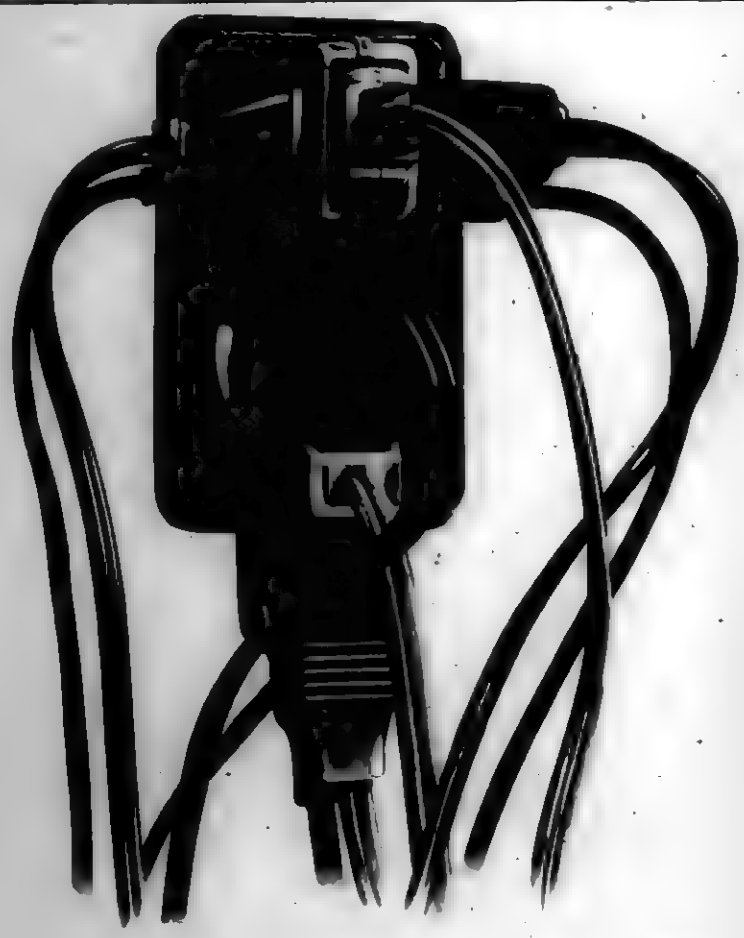
Without applications and PBX links, the computerphone is little more than an expensive autodialer and semi-intelligent terminal. There will never be a demand for computerphones that lack links to higher level systems. Northern Telecom expected to sell 100,000 stand-alone Displayphones in its first year of shipments, but only 10,000 have been shipped to date. Their efforts were continually plagued by the user query, "But what do I do with it?"

THE CREATION OF the computerphone market will hinge on two factors: first, finding a niche function within user organizations and proliferating from that entry point; and second, creating usable communications applications such as data base, videotex, professional computer synergy, messaging and telephony automation.

Just as spreadsheets became the launching pad for personal computers, telemarketing could become the linchpin for the computerphone. In the first phase of the market (1983-1986), computerphones are expected to find their way into large corporations via sales departments. Vendors with experience in the market, such as Davox and Northern Telecom, indicate that their machines are being installed where there is a clear intersection of the telephone and data base functions. For example, Morgan Stanley brokers are using 300 Davox Desksets to track sales leads and access client files. Burlington Northern Air Freight uses Davox for credit collection. A large medical supplier uses 300 Displayphones for sales tracking.

Once the computerphone is installed and supported by a sales data base, it could branch out into the executive suite and onto managers' desks. This second computerphone phase (1987-1990) will center on the availability of communications applications including an easy-to-use data base, perhaps videotex; message creation, storage, retrieval and transmission; personal computer links; and advanced telephone functions.

The computerphone market is still in its infancy. Emerging technologies, such as voice I/O, digital PBXs, packet-switched interfacility links, and the recent AT&T divestiture are converging to create special conditions. These market shifts could make the computerphone the next hot workstation. ■



Pull the plug on your inefficient data communications. We can help.

Many data communications networks, perhaps yours included, have grown in the same add-on way as this common octopus plug arrangement. Yes, it works. But it contains many built-in risks and could ultimately let you down.

The time is right for you to take a careful look at how General DataComm can streamline and improve your data communications, and save you money at the same time.

Here's how.

Since we are a full-line data communications manufacturer, everything from modems and multiplexers to network management systems and service support, we can design a complete system for your company. It will not only work better but save line costs, too.

When we install a system it not only means higher efficiency now but it will expand easily to meet your needs tomorrow.

Tie your network together.

Our true systems approach also helps eliminate compatibility problems. Since we design and manufacture the full product range, you can be sure everything will always work in harmony.

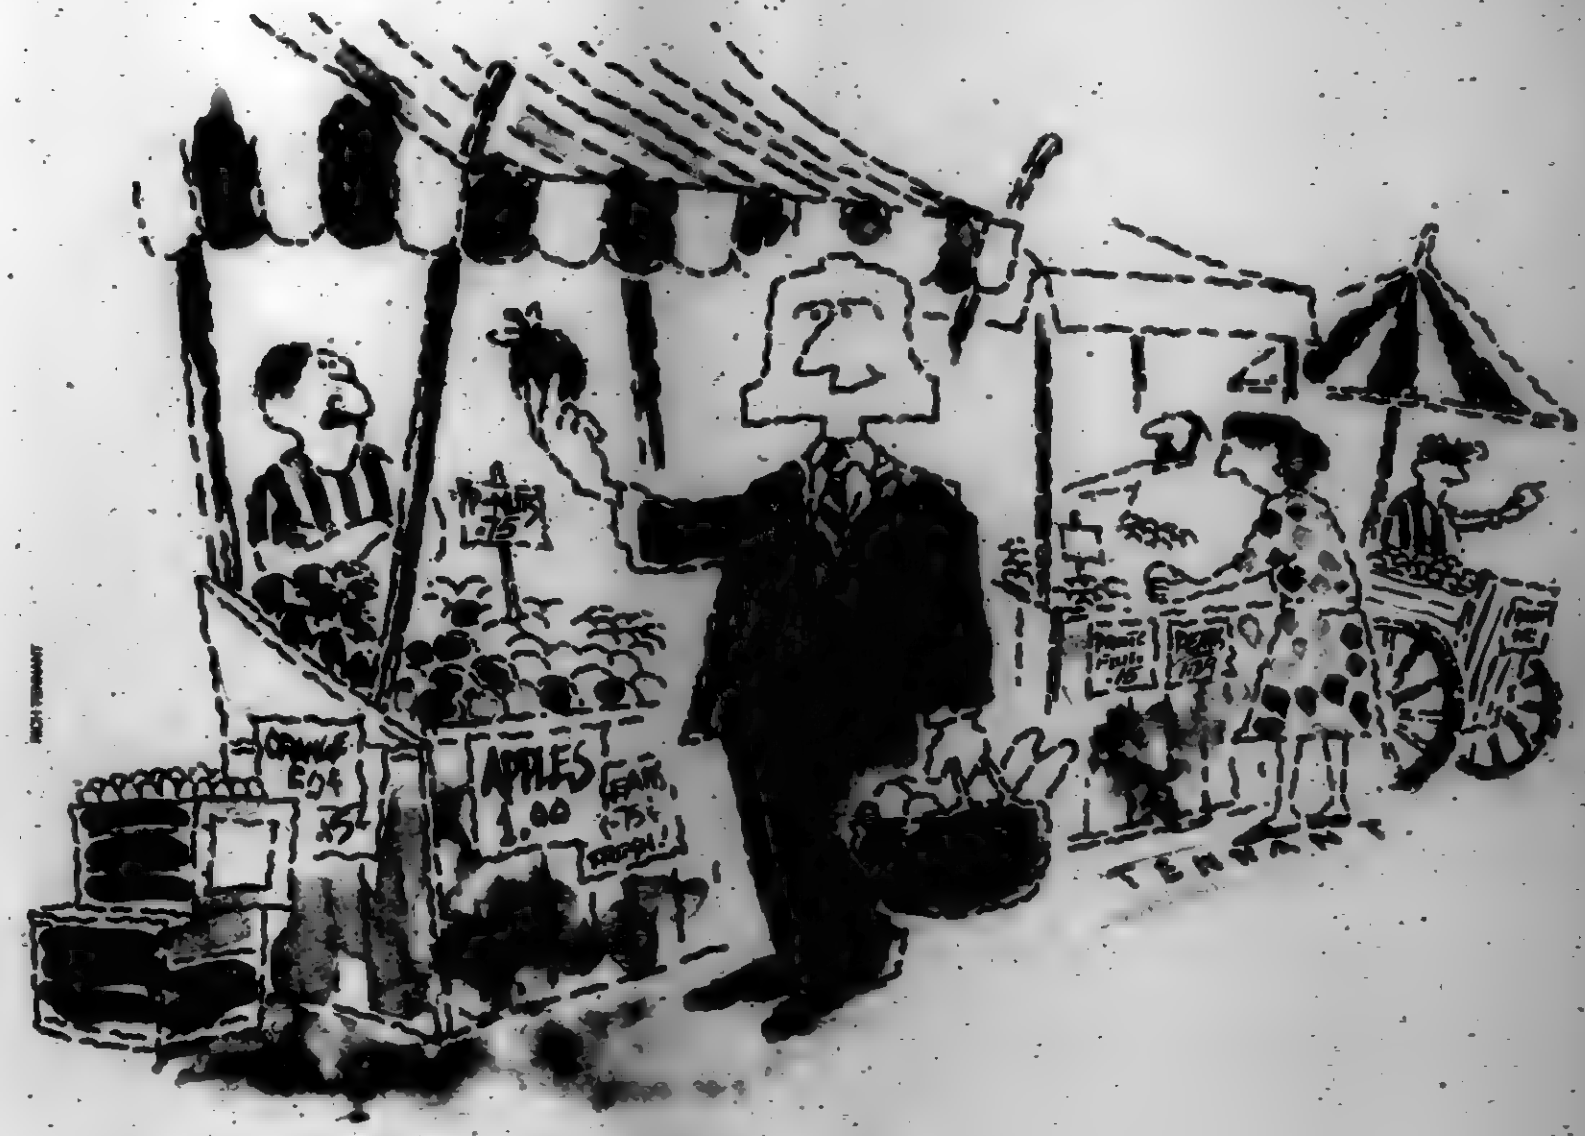
Put our experience to work for you, especially now in the new divested telecommunications environment.

For a free brochure detailing our approach and product range call or write to General DataComm Industries Inc., One Kennedy Avenue, Danbury, CT. 06810. (203) 797-0711.

General dataComm

We're the full line data communications company.

The Data Movers



THE GREAT CPE SHOPPING SPREE

BY KATHERINE HAFNER

The regional operating companies, thrust into the competitive marketplace for telephone equipment, have been faced with the formidable task of buying the equipment they will resell to customers. The resulting situation is an OEM extravaganza, with communications vendors hot on the tail of seven companies that, until recently, recognized but one supplier — Western Electric.

The newly unleashed regional companies have recently signed contracts that commit them to over $1 billion in purchases of customer premises equipment over the next three years.

Hafner is staff writer for Computerworld On Communications.

Three of the big winners in the race to supply the local companies are Northern Telecom, Inc.; NEC America, Inc.; and TIE Communications, Inc., along with its Technicom International, Inc. subsidiary. TIE, a relatively low-profile manufacturer of small business telephone systems based in Shelton, Conn., has signed contracts with six of the regional companies, as well as Southern New England Telephone (Snet), which is minority-owned by AT&T.

Other vendors of telephone and switching equipment that have won contracts with the regional companies include American Telecom, Inc., ITT and Comdial Corp.

No longer constrained by an exclusive dependability on equipment from the former Western Electric, which has been renamed AT&T Technologies, the operating companies have had a field day with all the equipment available. The list of products being purchased by the local companies includes everything from single-line cordless telephones to private branch exchanges (PBX) for large businesses.

Never having been presented with such freedom of choice and by no means immune to the marketing blitzes that can plague many a consumer, the local operating companies did not have the easiest time making their purchasing decisions.

"We went for the established ▶

vendors with state-of-the-art equipment," commented Pat Hammerstrom of BellSouth Corp., the holding company for Southern Bell and Southeastern Bell. "We had to look not only at the products, but also at the kind of contract that could be worked out with the different vendors." (See the figure on Page 67 for a list of vendors and their products).

BellSouth has signed contracts with nine separate vendors sifted from an initial pile of over 100. For BellSouth, the selection process started in June 1982 and lasted a full 18 months. The result was a group of contracts ranging in duration from two to four years and totaling $200 million.

"We did a tremendous amount of testing," Hammerstrom pointed out. "We had an entire task force that did nothing but test equipment."

While loath to cite specific reasons for choosing one vendor over another, Tom Stoddard, a BellSouth spokesman, pointed out general characteristics BellSouth was looking for in its evaluation of products. "We looked at just about every factor you can think of," he said.

These included "quality, technical leadership, stability, the ability to provide enhancements and lots of internal things such as how similar the stuff was to what our people are familiar with, as well as the training and support we would receive from the manufacturer," Stoddard said.

Ameritech, the Chicago-based conglomerate of Illinois Bell, Indiana Bell, Michigan Bell, Ohio Bell and Wisconsin Telephone, went through a similarly intensive search, but in half the time. Ameritech has given its business to NEC America, TIE Communications, Ericsson, Inc. and AT&T Technologies.

"We began with a list of about 100 vendors worldwide in the spring of 1983 and narrowed it down to about 45 by the summer," Ameritech spokesman Bill Hensley pointed out.

"When we got down to the final 12, we scrutinized the products and companies. We looked at the total company from its top management on down. We reviewed software, supply capabilities, production and, of course, pricing. Then we came down to the final four."

According to Hensley, the search was absolutely thorough because "these products will form the backbone of the state-of-the-art equipment we are offering to more than a million customers in the five-state area. We are striving to be a total supplier for customers."

Despite the plethora of cutting-edge technology Ameritech can now provide its customers, the regional company plans to maintain Centrex as its flagship service offering throughout the five states, selling the equipment more as an ancillary offering.

"The equipment we are marketing is designed to make Centrex even more valuable to customers," Hensley said.

"We offer a variety of PBXs as well, for customers who want to own their own switch or are in more rural areas where we can't provide Centrex," he explained.

Where does AT&T Technologies fit into this competitive tangle? While some of the regional companies are delivering their erstwhile supplier an outright snub, others such as Ameritech

Computerworld/Espana makes talking to the Spanish computer market easy.

Spain has become a major and fast-growing market for U.S. exporters. There are currently 4,000 general purpose computers at 3,000 sites in Spain at an installed value of 42.2 billion. In addition, there are more than 11,000 office computers in operation. Industry revenues are increasing 20% to 30% yearly contributing to Spain's GNP growth of 9% annually for the last three years. To meet this growing demand for DP equipment, products and services, computer professionals read *Computerworld/Espana* when they look to buy. *Computerworld/Espana* is the only EDP newspaper serving the Spanish data processing market. Modeled after its sister publication *Computerworld*, it is a weekly tabloid with the most up-to-the-minute information for DP professionals and users who need to keep informed on the fastest growing industry in the area. And now, *Computerworld/Espana* makes its mailing list of 9,000 EDP and MIS executives available for rental. This is a unique opportunity to test your product or service in this burgeoning market.

For further information on advertising in *Computerworld/Espana* or its mailing list, just fill out the coupon below.

have either signed actual contracts with the AT&T appendage or have some kind of plan, however indefinite, to work the company into their overall game plan.

"For now, Western Electric doesn't fall into our highest function and highest quality list," said John Phelps, vice-president of operation for Southwestern Bell Corp., which signed up with TIE, American Telecom, ITT and Northern Telecom.

"We certainly did consider Western Electric products, and this doesn't mean we will not use their products in the future. They just did not provide the marketing flexibility we were looking for," Phelps said.

Marketing flexibility can prove pivotal in a regional operating company's decision whether or not to buy a piece of equipment. "We wanted to put our name on the products, and Western didn't go along with that," Phelps commented. "We also wanted exclusive rights to market equipment in the five-state area. The marketing flexibility was a very big factor for us.

"I've been with the Bell System for 14 years," Phelps continued. "And I was just amazed at the number of manufacturers there are out there, making everything from single-line sets to sophisticated PBXs." According to Phelps, it took the company "hundreds of hours" of evaluation before deciding on the four vendors.

"I've been with the Bell System for 14 years," Phelps pointed out. "And I was just amazed at the number of manufacturers there are out there, making everything from single-line sets to sophisticated PBXs."

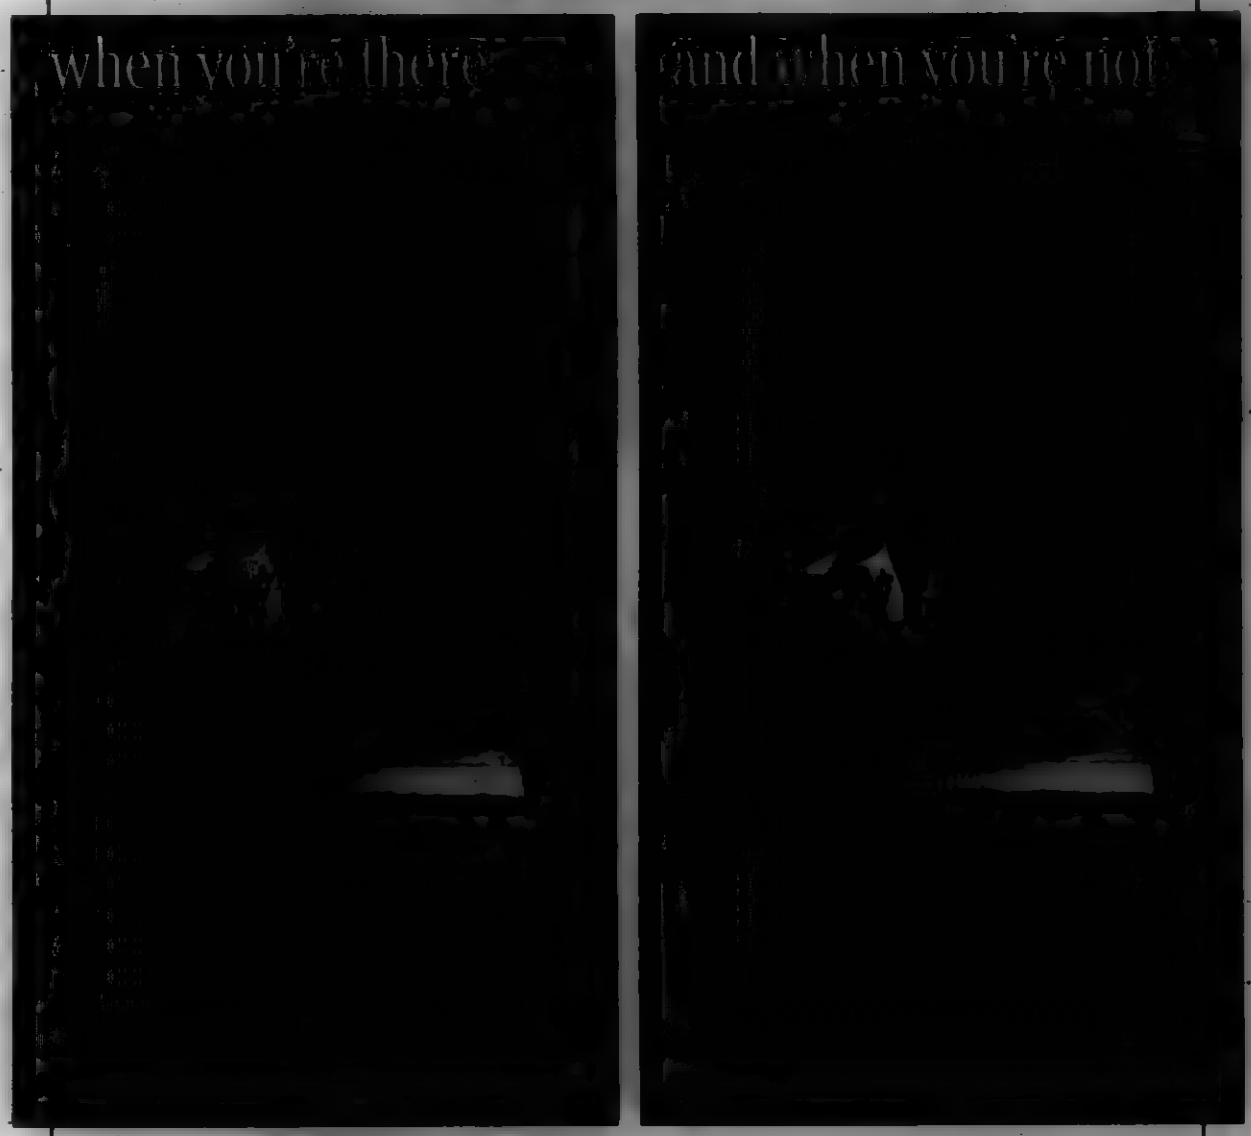
TWO OTHER factors governing a regional company's decision to buy or not to buy included production capabilities and manufacturer support. "Without exception, whoever we agreed to do business with, there was outstanding support," Phelps said. "We made our determination based largely on whether we felt the manufacturer would work with us.

"And obviously," he continued, "manufacturing capabilities determined the decision as well. We projected our needed volume to be such and such, and if they couldn't produce that much, we took our business elsewhere."

The sales to the regional companies will not make an enormous difference in the annual revenues of some of the big contract winners. For others, the contracts represent a quantum leap in overall sales. TIE, for instance, whose annual sales for fiscal 1983 totaled $320 million, sees its seven contracts as "a nice piece of new business." According to a TIE spokeswoman, the contracts with the regional operating companies will generate an additional $100 million worth of business per year.

TIE refused to elaborate on the marketing strategy that has helped bolster the company's profits so markedly. NEC America also declined to comment, a silence the company claims is part of its contractual agreement with the telephone companies.

Take control of tech control.



Introducing the Intelligent System Control Console.

The Bytex AUTOSWITCH Electronic Matrix Switching System, under control of our new color Intelligent System Control Console (ISCC), will perform tasks such as restoral switching when alarms occur, time based configuration switching, and event logging to disk of alarms, system diagnostics and operator commands—all automatically.

With additional features such as Menu/Function Control, Multi-level security codes and user created files, your ISCC Autoswitch System will provide you with the operational simplicity and enhanced flexibility to maintain network performance.

So whether you're there or not, Bytex is ready to put your tech control in control with our AUTOSWITCH Intelligent System Control Console.

CPE Shopping Spree

As Bell Canada's major supplier for nearly a century, Northern Telecom knew precisely how to go about winning the business of the regional companies in the U.S. "From working with Bell Canada, we've learned a tremendous amount about what transition entails and how to establish our marketing position with the Bell companies here in the U.S.," commented Lee Bauman, vice-president for Northern Telecom's distributor marketing division. "Our core involvement with Bell Canada has been our major preparation for our capability to work with the Bell companies."

Experience has taught Northern Telecom not only to stay tuned to a telephone company's requirements when negotiating a contract, but to look at the customer premises equipment market in a much broader perspective than one might ordinarily take.

"People look at [customer premises equipment] as distinct from other areas of the communications business," Bauman said. "There are many other things happening on the network side of things that have tremendous impact on the [customer premises equipment] area and vice versa. It is very valuable to a Bell company to be able to see [a supplier's] entire breadth and depth of development. That's valuable, not only for current applications, but in the longer term as well."

Conspicuously absent from the roster is Rolm Corp., the digital PBX manufacturer whose Computerized Branch Exchange switch first encroached on AT&T's turf in 1975. According to William Krepick, director of group marketing at Rolm, the Santa Clara, Calif.-based company's lack of interest in distributing its products through the regional companies has to do with its overall marketing strategy. "About 25% of our business goes through independent distributors and the rest goes through our own sales and service centers," Krepick said. "We don't pit one distributor against another. So we wouldn't even think of selling to the operating companies.

"We did not make a single phone call to any of the operating companies," Krepick added. "We have absolutely no desire to market through them because it would be 180 degrees opposed to our distribution strategy."

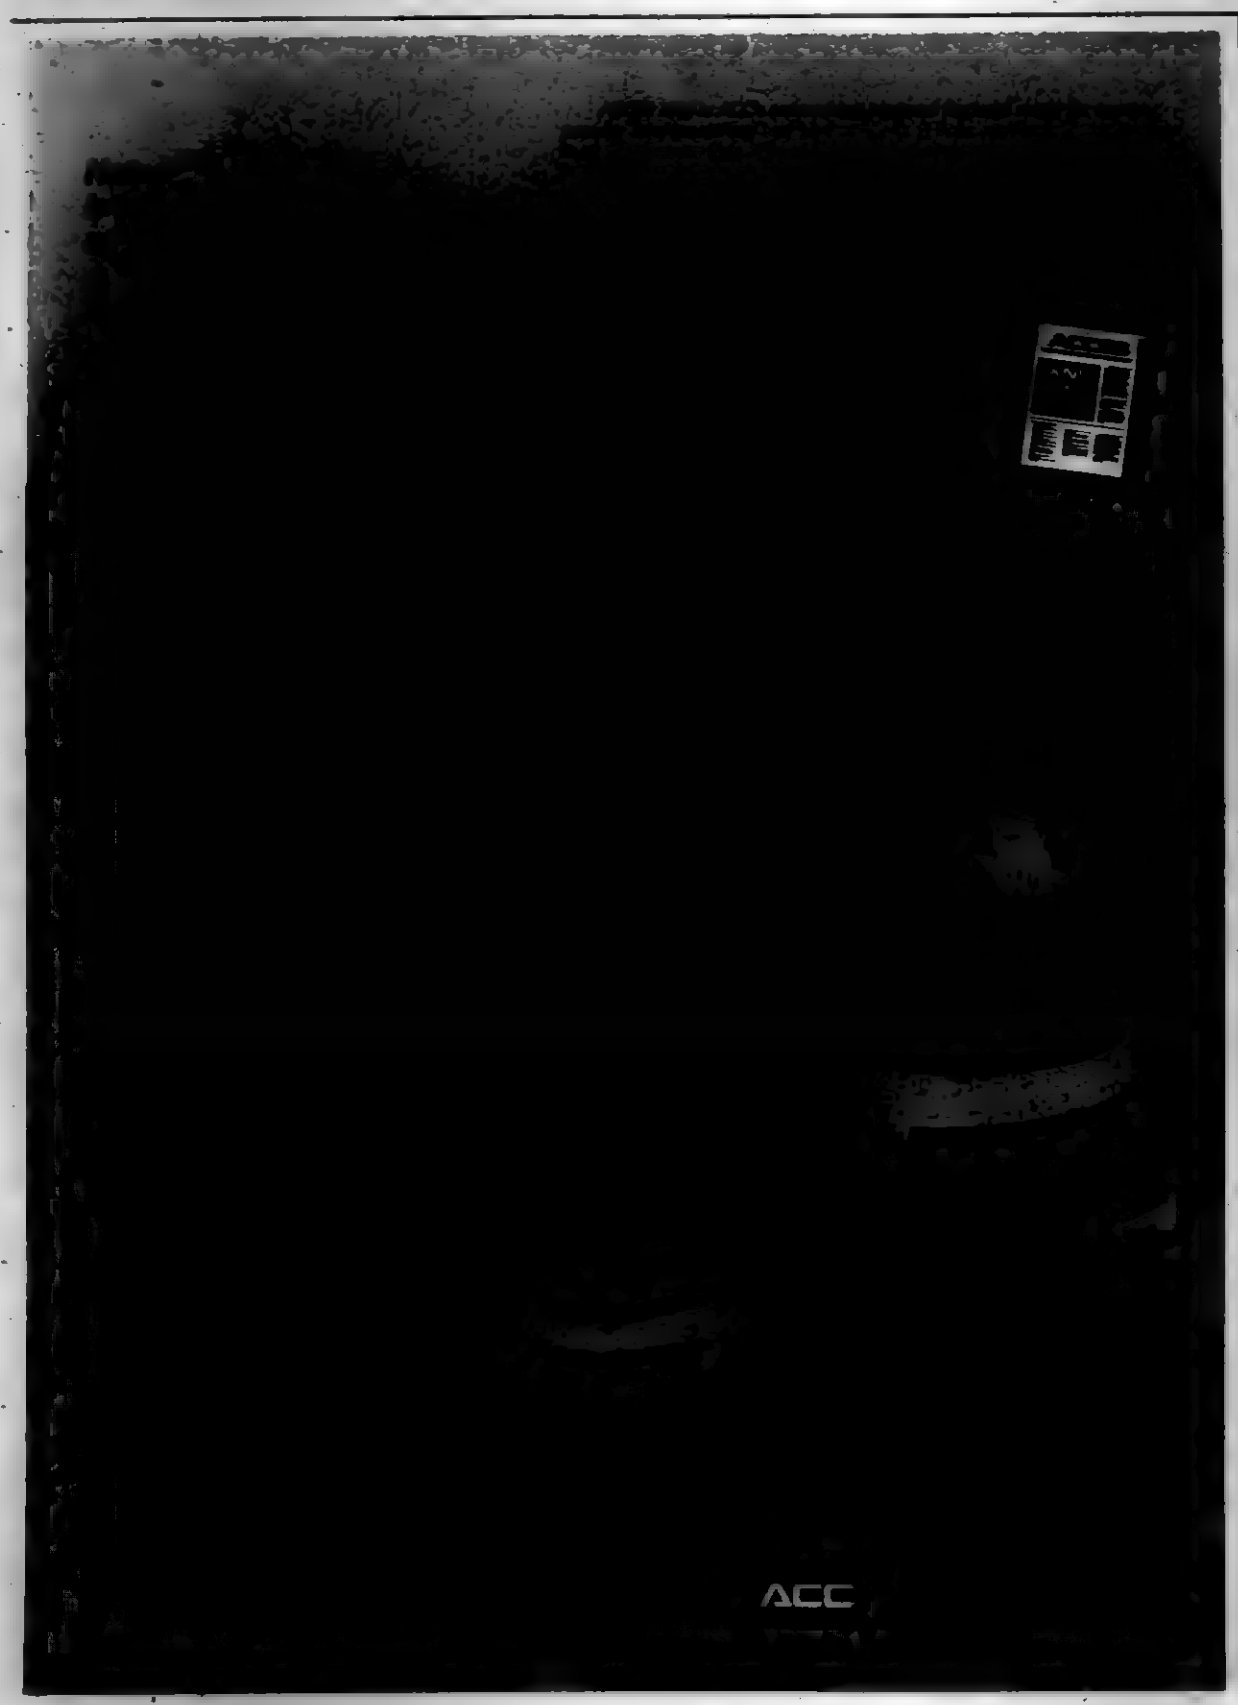
Vendors and Their Product Offerings



AND THEN THERE are Snet and Cincinnati Bell, which, by virtue of AT&T's minority ownership in the two companies, did not have to wait until Jan. 1, 1984 to enter the competitive marketplace. Cincinnati Bell, serving a 15-mile radius in the Cincinnati area and parts of Indiana and Kentucky, still relies heavily on AT&T Technologies, while Snet has gone full tilt into the open market.

"We're dedicated to a multisource philosophy," Mike McCann, a spokesman for Snet, said. "There are so many good vendors out there and so much good technology, we feel that our customers' needs cannot be served by any one, two or three vendors."

Consequently, through its Sonecor Systems distributing arm, Snet offers products from seven separate vendors. And although it serves just the state of Connecticut for telephone service, Snet is free to market its products nationwide. With a year's head start on the other regional companies in the months preceding the divestiture, Snet announced two major products: its System 2001 office system and Lightnet, a joint venture with CSX Corp. to build a fiber-optic network throughout the Southeast.

On New Year's Day, of course, the seven regional operating companies were freed to follow Snet's example. It was simply a matter of getting equipped. ■

IRCs AND THE INTERNATIONAL CONNECTION

BY PHILIP A. TENKHOFF & JAMES C. COLLARD

For many users, planners and operators, international communications represents a major unknown. Even for corporations with extensive domestic communications networks, considerable apprehension often exists concerning the most appropriate approach to satisfy international data communications needs. International data communications to and from the U.S. has been provided by specific companies that are authorized by the Federal Communications Commission (FCC). These companies have traditionally been known as international record carriers (IRC). IRCs have an exclusive license for the transmission of records on an international basis.

Five IRCs have provided communications between foreign countries ▶

Tenkhoff and Collard are president and vice-president, respectively, of Network Communications International, Olympia, Wash.

and the U.S. for several decades. These are FTC Communications, ITT World Communications, RCA Global Communications, TRT Telecommunications Corp. and Western Union International.

Prior to the '80s, the situation was reasonably static, with the IRCs generally competing with each other to offer a well-defined range of regulated, tariffed services. The principal offerings were telex and point-to-point leased circuits.

During that period of time, the IRCs competed for market share through service, in-country presence and marketing acumen. Prices were regulated by tariffs and were, therefore, virtually identical for all IRCs, with some exceptions such as telex pricing for smaller carriers. From the user perspective, there appeared to be little or no difference between the various IRCs. A telex was a telex regardless of whether it was handled by TRT or RCA.

International Carrier — Division of Responsibility

The '80s have witnessed significant changes in international communications. The principal forces effecting change are:

- Deregulation of the U.S. telecommunications industry;
- Diversification of services provided by IRCs;
- Acquisition of some IRCs by U.S. domestic carriers;
- Changing policies of foreign telecommunications administrations;
- Availability of new technologies;
- International standards adopted by Postal Telephone and Telegraphs (PTT).

A key U.S. policy change was a 1980 FCC decision that permitted the entry of new international carriers, but not record carriers. International carriers are allowed to carry voice and data only, while record carriers may carry voice, data and other services, such as telex. This decision reversed a 1967 FCC decision, which clearly separated voice and data carriers. The role of the IRCs in providing international communications between the U.S. and foreign locations must be examined in light of this changing environment.

In order to gain a better understanding of international communications, it is important to understand the role of each of the three major entities involved in providing it. These are the IRCs, foreign PTTs and U.S. domestic carriers.

The figure above is a simplified representation of the interrelationship among the three entities. The specific case of a leased circuit is shown for illustration. However, the same principles apply for telex, packet switching and so on.

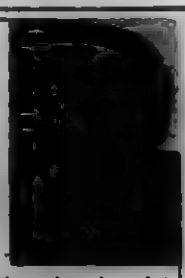
In the U.S., a domestic carrier provides service from City A to the international gateway location. The international carrier provides service between the international gateways of the U.S. and the foreign country involved. The telephone administration, usually known as the PTT in the foreign country, provides communications from that country's international gateway to the end-user location shown as City B.

With the advent of deregulation, the situation in the U.S. becomes more complex. The domestic carrier link in the figure could consist of local carriers such as U.S. West and Nynex and long-haul carriers such as AT&T and MCI Communications Corp. Conversely, the number of carriers may be less for a given situation. For example, MCI Communications Corp. now offers both domestic and international carriet service. The introduction of new international carriers, which also offer data transmission, complicates the U.S. situation. These new carriers include AT&T and Satellite Business Systems.

Even the situation with foreign PTTs is beginning to change. The UK has instituted a policy of telecommunications competition in lieu of the former monopoly. Other European PTTs are watching British developments carefully.

The important observation is that several distinct organizations are involved in providing international communications. Successful communications requires a carefully orchestrated, cooperative effort among all participating organizations.

A key result of the multiple supplier nature of international communications is that the end user must become more involved in the operational issues. The user is



How Dave Vipler "dumped the dumb"

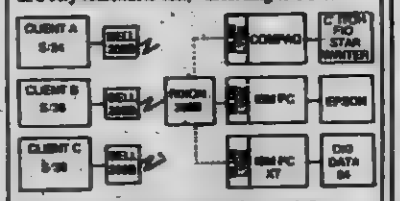
Experienced and consulted consultants know that customer support is the name of the game. Dave Vipler, now managing director of the New York based *Computer Consulting Center*, in his 14 years with I.B.M. saw too many clients get burned by here today-gone tomorrow consultants. What seemed like a finished program package invariably needed additional work once the consultant left.

Dave recognized that a quality consulting service must provide continuing client support. In 1981 he founded the Center to assist business with their I.B.M. S/34, S/36, S/38, 3Bxx, 4300 series systems and PCs.

"The Center was organized to provide quality computer consulting to clients that are integrating distributed processing systems into their computer networks," said Dave.

With a staff of 22 professionals, Dave felt that the Center could adequately support its New York City users. Plans to significantly expand their New Jersey operations prompted Dave to find a more convenient method of maintenance, particularly for those programming bugs that only surface after office hours. It was one thing to have a programmer drive an hour each way to spend a full day on site, Dave reasoned, but to make the trip for a half hour of "Firefighting" was too costly.

"One client said, 'How do we get you back if we have problems?' BLUE LYNX was the answer for us at a very reasonable cost," according to Dave.



The Center now has 2 PCs, 2 XTs, and 2 Compaqs, each equipped with BLUE LYNX. Their programmers can now sit at their desks and modify programs on I.B.M. host systems downtown, in New Jersey or wherever the accounts are located. Dave's clients were so impressed with BLUE LYNX that some have bought the hardware/software package for their own internal needs.

"The BLUE LYNX™ documentation was excellent. It went up easily and with no support from Techland required. We now use BLUE LYNX to support clients in New York City, as well as those in New Jersey. With BLUE LYNX behind us we can now use our communications ability not only for programming tasks but also as a sales tool."

BLUE LYNX terminal packages include:
3251/12 emulation for S/34, S/36 and S/38.
3276 emulation SNA/SDLC or Bisynch.
Hardware/software package $695 complete.
Combination of 2 emulators $1250.
VT100/52 emulation software $125

BLUE LYNX 3251 is a joint development of Software Systems, Inc. of Fullerton City, Missouri & Techland

the only organizational entity that has a complete sense of responsibility for end-to-end operation. While this conclusion is distasteful to many companies, it is nevertheless a fundamental axiom of international communications.

Two recent major acquisitions indicate future trends for the IRCs. Tymshare, Inc. acquired FTC Communications, and MCI acquired Western Union International. These acquisitions give MCI and Tymshare a combined domestic and international capability.

Other new providers of international telecommunications services are emerging and will compete with existing IRCs for market share. Communications Satellite Corp. (Comsat) has provided satellite capability to established IRCs since its inception. With the advent of deregulation, Comsat will likely become an international carrier and provide some services directly to end users.

By agreement with individual PTTs, AT&T has provided international voice service for many years, but has been precluded from providing certain data services. New FCC regulations permit AT&T to provide such data services. Other carriers will also try to compete for the lucrative and rapidly growing international data communications market.

THE PRINCIPAL deterrent to this expansion rests with the foreign PTTs. A common attitude is, "We have enough trouble establishing appropriate relationships with the five U.S. carriers; we have no desire to recognize any new U.S. carriers." Thus, even though the U.S. regulatory authorities will permit an expansion in the number of international carriers, the potential new carriers will encounter severe difficulty in being recognized by foreign telecommunications administrations.

The historical basis of IRC services has been leased circuits, telex and Datel. Datel is a generic dial access service used for the transmission of data on a worldwide basis. These traditional services existed relatively unimpeded and unchanged for years. However, current and projected services represent a greatly expanded version of these more familiar services.

Many enhanced services are available from the IRCs. A brief description of these services is outlined below.

■ *Leased circuits.* IRCs offer point-to-point leased circuits in conjunction with U.S. domestic carriers and the PTT of the affected country. While all options are not available in all locations, some typical options for users are analog or digital; speeds of 50 bit/sec to 50K bit/sec; alternate voice and data, simultaneous voice and data and data only.

■ *Telex.* Each IRC provides classic international telex services with similiar characteristics. The service is 50 bit/sec. In addition, 110 bit/sec is generally supported.

■ *Computerized message switching.* This service provides for interconnection between customer networks and the public telex networks. Such systems are being used by corporations with large message volume requirements to optimize costs. Some features of computerized message switching are: I/O at speeds up to 1,200 bit/sec, Baudot and Ascii code support, message assurance provision and code translation.

■ *Store-and-forward message services.* An enhancement to telex capability is the provision of store-and-forward message services by the IRCs. This service permits operators to enter all messages for subsequent retransmission and verification by the IRC.

■ *Packet switching.* The IRCs, in conjunction with certain PTTs, offer packet-switching service between the U.S. and selected foreign countries. This service is interconnected and totally compatible with Tymshare's Tymnet and GTE Telenet, Inc.'s Telenet network in the U.S. It is offered both to and from the U.S. with established tariffs based on use.

■ *Datel.* Datel is provided by IRCs between principal foreign countries and the U.S. This service provides for speeds up to 4,800 bit/sec (lower limits in certain countries) with charges based on use. However, most PTTs only guarantee acceptable error performance at 1,200 bit/sec, with a few at 2,400 bit/sec.

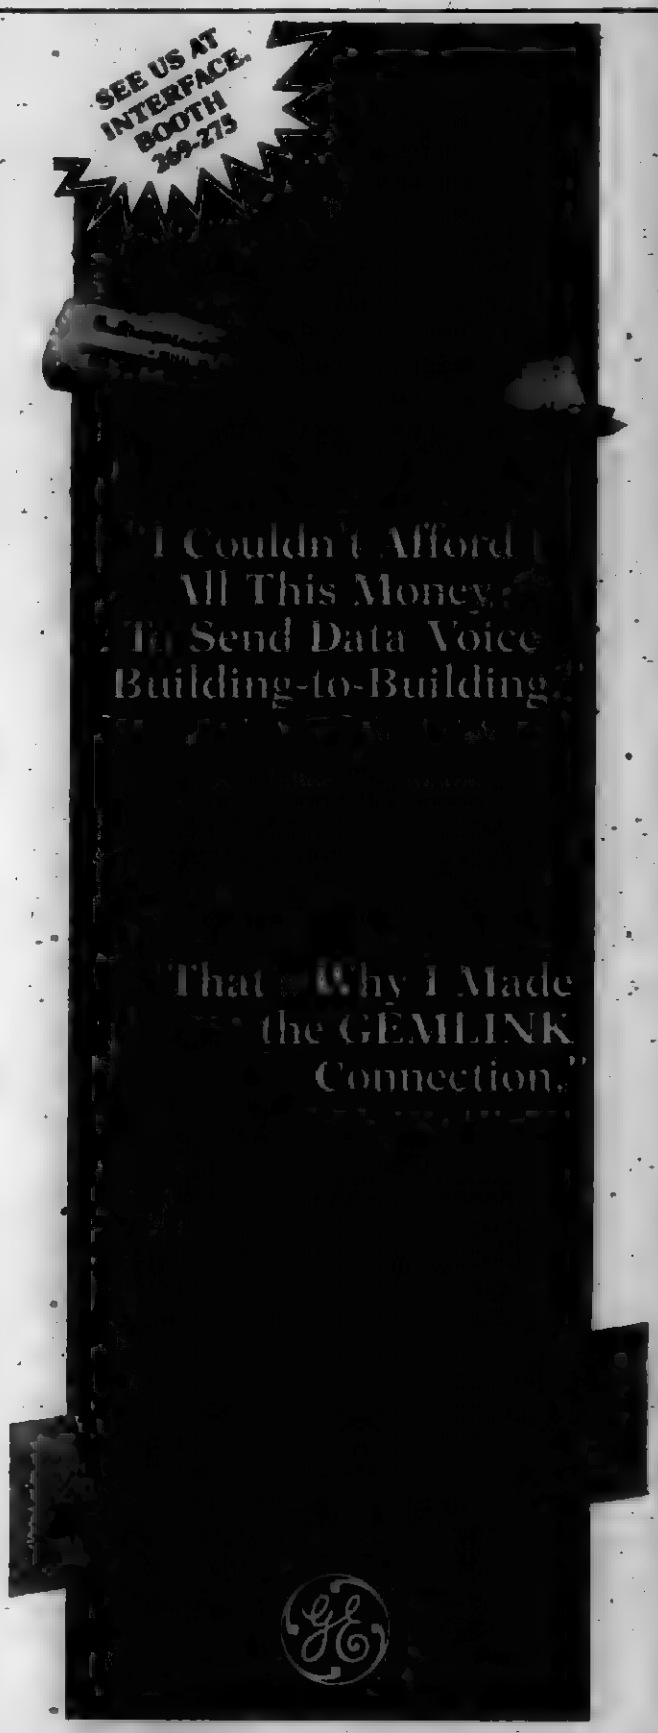
It has been our consistent observation that there is a significant gap between user expectations of services provided by the IRCs and the users' actual experiences with these services. This observation is not intended to be an indictment of the IRCs; in many cases, the IRC is constrained by the regulations and policies of the foreign PTTs.

From our experience with clients with multinational telecommunications requirements, this dichotomy between expectation and experience rests in five principal areas: support, schedules, cost, administrative complexity and availability of services.

Perhaps the most vociferous user complaint lies in the area of overall support from the IRC. Many users equate the IRC's role in international communications with the AT&T's traditional role in domestic services — that is, the IRC would assume responsibility for end-to-end service and would provide a level of support commensurate with that responsibility. In reality, the IRC cannot supply such a level of support. However, even within the sphere of responsibility of the IRC, in general, users have received a less than acceptable level of support. This includes support in planning, installation, operation and maintenance.

Those charged with the responsibility for planning and implementing international communications tend to expect installation schedules for various facilities to be comparable with similar schedules in the U.S. Experience has demonstrated the need for incorporating longer installation lead times into implementation plans.

The cost of international data communications is an issue with virtually all users. The most significant cost factor is the relatively high cost element established by the PTTs. International communications costs represent negotiated tariffs between the IRCs



The Solution.

Dial-Up 3270

LineMaster An intelligent device for dial-in access to your mainframe 3270 Bisync line. **LineMaster** is a communications watchdog which keeps a line in service until a user dials in.

- For any remote 3271/4/6 line—up to 19.2K baud.
- Compatible with any 3270 BiSync emulator including microcomputers.
- Connects between modem and mainframe.
- Installs in minutes.

$639.

You can advertise your product in 40 computer publications in 25 foreign countries—with one phone call.

There's a market for your product abroad.
You can reach the right people in the major computer markets throughout the world. The people who make the buying decisions—in countries already importing more than $3 billion in computer hardware, software and supplies.

CW International Marketing Services gives you one, efficient source for direct contact with the leading local computer publications in the world's major computer markets. How can we do this for you? We have a wide network of editorial offices around the world and provide first hand marketing information to our clients. Plus, we have over 10 years experience in the publishing industry.

We're a division of CW Communications/Inc., publishers of *Computerworld* and the world's largest publisher of computer-related newspapers and magazines.

CW International Marketing Services makes it easy.
We'll translate your ads for you and give you production services to meet the specifications of any or all the newspapers and magazines we publish or represent—and—we'll even bill you in dollars. What's more, when you place your advertising through CWIMS, you save the V.A.T. (value-added tax). It's as easy as advertising in your local publications.

We'll even help you with market facts, and, in the case of the People's Republic of China, we can arrange for you to give product and marketing seminars there! You can run your ads in our periodicals in these countries:

*Argentina	*Denmark	*Italy	*Norway	*Saudi Arabia	*Sweden
*Australia	Finland	*Japan	*People's	South Africa	*The Netherlands
*Brazil	*France	Korea	Republic of	*Southeast Asia	*United Kingdom
Chile	Greece	*Mexico	China	*Spain	*West Germany
	India		Peru		

*Published or co-published by CW Communications/Inc.

For more information on how we can help you promote your product all over the world, send us the coupon below or call Diana La Muraglia toll-free at (800) 343-6474 or telex #95-1153. In Massachusetts, call (617) 879-0700.

and PTTs of each country. Since the PTTs almost always represent a monopoly, there is no competition-driven incentive to keep tariffs low. Data communications planners attempt to extrapolate the experience of the U.S. to the larger sphere of international communications; such an approach produces misleading and disappointing results.

Submitting telecommunications orders for international communications generally requires submitting separate orders to each of the suppliers. While the IRC may function as a coordinator, it cannot function as the ordering agent for PTT-provided services. The user must issue individual orders to the PTTs for the required in-country services. For certain PTTs, this requires a time-consuming process of administrative detail that greatly exceeds comparable U.S. carrier requirements. However, with the AT&T divestiture, this situation will become common in the U.S. and may no longer seem foreign.

Another difference between user expectation and experience is the availability or nonavailability of services. There is a tendency to assume that the telecommunications services available in the U.S. will automatically be made available in principal foreign locations. This is obviously not the case. In addition, foreign PTTs are generally less flexible in the interpretation of services and in permitting special modification of services than has been the U.S. experience. However, this restrictive attitude is gradually evolving toward one of more flexibility.

From our experience in working with clients with multinational needs, the two major areas of difficulty for such communications are defining information movement requirements and understanding available alternatives for international communications.

IN ESSENCE, PLANNING international communications should follow the same logical process as planning for domestic or local communications. The first step is to define carefully requirements for information movement independent of available means to satisfy these requirements. The definition should reflect needs as contrasted with technologically driven solutions.

The next step is to determine the available alternatives. This process is often the most frustrating, particularly for neophytes. Unfortunately, there is no single comprehensive source of information regarding international communications in the U.S. Often, some available sources may provide incomplete or conflicting information. Sources that may be used to help in defining alternatives are: IRCs, U.S. carriers with international interconnects, foreign PTTs, consulting firms knowledgeable about international communications and other companies with established international data communications capabilities.

Once the available alternatives are defined, the analysis of the alternatives is usually relatively straightforward. Particular attention needs to be paid toward cost, reliability, support and technical compatibility.

The most necessary, but most often neglected attribute is well-documented user procedures. Normally, the user will need to develop these procedures, because they simply are not available in a complete form from the various carriers involved.

How does a prospective user assimilate all of this to choose the IRC that best satisfies its needs? Unfortunately, the predominant method has been an ad-hoc process. Often, the selection is made without any form of meaningful comparison of available alternatives. A prevalent attitude has been that such a comparison does not make any difference.

The complexity and diversity of international communications demand a more rigorous approach toward carrier selection. The first step is a formal planning process, as outlined above, which results in a definition of requirements. The next step is the preparation of a written request for proposal. Even for relatively simple needs, selection of an international carrier should be based on vendors' formal, written responses to a statement of requirements. Examples of topics to be included in such a request include functional requirements, vendor support, maintenance, pricing and vendor range of services. They also include overseas representation, schedule requirements and customer reference.

In the future, the key theme for established IRCs and new international carriers is diversity of services. Competition for market share will be waged over attempts to provide a range of services that is most responsive to user needs.

International communications is evolving more rapidly than ever before. Advances in technology and the changing regulatory environment provide the driving force behind this change. Users need to plan and procure international data communications in a more formal, rigorous manner. ■

Overlord is Here!
Intelligence that Grows.
Power that Grows.

Overlord™ is here. The first level of a revolutionary hardware/software package that allows you to access, monitor, do the housekeeping, and control your computer/data communications network. Regardless of size, application or location.

Overlord is centralized MIS capability featuring a network data base, report writing, history file and trouble ticket generation. The information is consolidated with T-Bar's control, on-going real-time monitoring, performance analysis and fault isolation, all accessed via interactive color graphic CRTs.

Overlord's capability to learn is virtually unlimited. And, as you add to its data base, you increase its power, allowing you to manage networks at levels of efficiency and effectiveness never before possible.

Overlord establishes a hierarchy that provides centralized control for data processing or data communications. If desired, it enables you to access both facilities and merge them into an integrated management information, test and control system.

Overlord. Intelligence and power to help you improve your systems management. Find out more at Interface, or just give us a call.

EXIT

Mike Harrison, above, is group production editor, Computerworld Pty. Ltd., Australia. He submitted this anecdote about an electronic editing system.

It was all very pioneering stuff when a Sunday newspaper installed the first on-line editorial system in Sydney, Australia, a few years ago. It was a hybrid thing built round a Harris Corp. CPU with insolently dumb terminals.

There were bugs galore compounded by a team of software engineers and programmers who toiled night and day to adapt an essentially American system to Australian newspaper conditions. Crashes were common, and the only people who benefited were the proprietors of a nearby hostelry where frustrated journalists retired to soothe jangled nerves, while an equally frustrated DP staff got the system up again.

Memory is dimming, but I recall one day when we had only three hours uptime in a 10-hour shift. There was even talk in the pub of dusting off the old hot metal equipment to get the paper out.

Slowly things improved; crashes became fewer, and it became possible to get through to lunch without those awful bells ringing and the red lamps flashing. A big plus was when the dumb terminals were pensioned off for what was then a magic box — the Digital Equipment Corp. VT72 intelligent terminal. We sub-editors — a strange breed of journalist known as copy editors in the U.S. — were particularly enthralled with the headfit facility, which saved hours of cursing when trying to fit heads in a particular type font.

Then it all started again: crash after crash, lost stories, cold starts and beaming smiles on the faces of the pub proprietors. The problem took some time to track down. Among our typefaces was a pi font comprising all sorts of ornaments and symbols. In one software upgrade, a routine had been altered slightly, and the system hiccuped when asked to count a headline with a pi font in it.

The edict was swift and final — no more pi fonts in headlines. One morning, the system came down, and a furious systems manager was seen with axe and block demanding the head of the culprit who had put a pi font in a headline. There was an expectant buzz among the few who had not gone to the pub.

But the witch-hunt ended as quickly as it began. No head was served up on a silver platter, and the systems people were peculiarly taciturn and unforthcoming.

It took weeks for the truth to filter out. It seems that a very senior company manager who fancied himself a dab hand at the keyboard was giving some visiting VIPs a tour, which included an aside on the great pi font mystery. To demonstrate his point, he stopped at an idle terminal, called up the appropriate test file and keyed in the command for headfit. Command, execute, crash.

THE DAY THE IBM PC BECAME OBSOLETE.

NET/PLUS

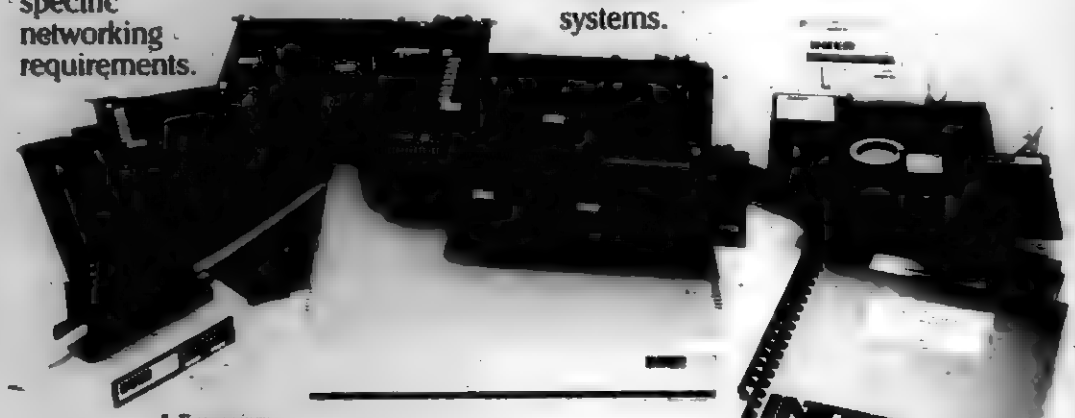
A True Multi-Vendor Local Area Network

NET/PLUS™ is a comprehensive Ethernet/IEEE-802.3 Local Area Network product line. It provides host-to-host, terminal-to-host, and device-to-device communications. And, in contrast to proprietary networks, NET/PLUS lets you tie together products built by different manufacturers, running under different operating systems.

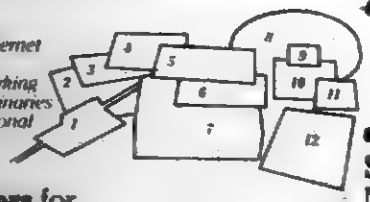
With NET/PLUS, different computers, from mainframes to personal computers, built by different manufacturers, running different software, are all tied together in a single resource-sharing network.

Plus Proven Network Building Blocks

Over twenty free-standing networking products together make up the NET/PLUS product line. You can buy a complete NET/PLUS solution, or choose individual products to meet specific networking requirements.



1. Transceiver 2. Data General Ethernet controller 3. UNIBUS Ethernet Controller 4. Q-bus Ethernet Controller 5. Multibus Ethernet Controller 6. Ethernet Protocol Module 7. Network Terminal Server (NTS) 8. Networking Software Sources 9. Networking Software Binaries 10. Ethernet Controller Diagnostics 11. Personal Computer Networking Software 12. Comprehensive User Documentation



■ **Communications controllers** for VAX, PDP-11, LSI-11, Nova, Eclipse, and MV Series, plus Multibus/68000, 8086, and Z8000 computers. Each DMA controller implements the entire Ethernet Specification and provides high-performance data transfers, extensive receive-data buffering for back-to-back frame reception, and a rich set of on-board diagnostics and network management statistics.

■ **Networking software packages** provide network-level and transport-level services for reliable, high-performance data communication. Written in portable C language, these packages implement the Xerox Network Systems (XNS) architecture and are optimized for Ethernet use. Packages are available for UNIX, VAX/VMS, and RSX-11 operating systems.

■ **ETHERNODE™ packages** incorporate controllers, networking software, transceivers, and cabling – all the hardware and software needed for host-to-host Ethernet communication among VAX/VMS, PDP-11/UNIX, RSX-11, and Multibus/UNIX systems.

■ **Network Terminal Server (NTS),** the newest NET/PLUS product, provides virtual circuit interconnection between any two RS-232-C devices on the Ethernet. Available in four or eight ports, NTS electronically establishes, maintains, and disconnects virtual circuits between computer ports, terminals, personal computers, modems, and printers. Typical applications include:

- port contention
- port switching
- resource sharing
- personal computer networking
- simplified RS-232-C wiring

Over a dozen different PCs can be networked with NET/PLUS.

■ **Multi-Vendor Personal Computer Networking Software** is available for over a dozen widely-used personal computers (including IBM, Apple, and DEC), microcomputer software development systems, and popular minicomputers. Terminal Emulation and File Transfer allow PC users to log on to other computers and freely access and transfer files throughout the network.

Networking Solutions

At Interlan, we have been delivering Local Area Network solutions since 1981, and today we have hundreds of customer installations. If you use or are considering Ethernet for reliable, high-speed communications in a multi-vendor environment, call or write for more information on NET/PLUS and the networking products that make NET/PLUS a reality.

Gould's first virtual CPU targets VAX

By Jamme Connolly
CW Staff

FORT LAUDERDALE, Fla. — Gould, Inc.'s Computer Systems Division last week announced its first virtual memory processor, a 32-bit machine that supports Unix and targets the Digital Equipment Corp. VAX-11 market.

Powernode 6000 operates under Gould's UTX/32 operating system, which includes features of both Bell Laboratories' System V and the University of California at Berkeley's BSD 4.2 versions of Unix. Gould said this Unix-based software can accommodate applications developed for a VAX environment.

The processor was designed for networked and stand-alone multiuser applications and is available in three basic configurations: the PN6030, the PN6050 and the PN6080 dual processor. The units were developed for software-development as well as for scientific, engineering, military, aerospace and educational applications.

The Powernode 6000 line is said to process compute-intensive tasks while allowing simultaneous workstation access to data bases. Gould claims the Powernode 6000 has outperformed the VAX-11/780, with the PN6030 and PN6050 operating 1½ to two times faster and the PN6080 performing 2¼ to three times faster than the VAX-11/780 using Unix.

The products were designed with the Gould Selbus, which offers a data transfer rate of 26.7M byte/sec. The Selbus is also used in the firm's larger Concept line of processors.

See GOULD page 4

Local-area nets still far off: Interface poll

By John Dix
CW Staff

LAS VEGAS — If sheer numbers alone tell the story, local-area networks are still only a possibility for most users and an evolving solution for the avant-garde few that have installed them.

That was the message gathered from a random selection of attendees queried at the Interface '84 conference here last week.

Sessions on local-area networks commanded standing-room-only attendance, but few of the conference participants polled said they were actually using the products. Organizations that have installed local nets reported varying degrees of satisfaction.

Kenneth Sumner, program manager of General Electric Co.'s Corporate Information Systems group, believes it will be a couple of years before local-area network technology becomes as competent as the vendors selling it.

GE has many local networks in place, but the largest one is an Ungermann-Bass, Inc. Net One. Consisting of four network segments interconnected with repeaters, this network is used to provide host access to between 8,000 and 9,000 terminals, Sumner said.

Sore points of GE's network development included growth problems and the need to keep current with the vendor as it was evolving its product line. Heavy interaction with the vendor was required to iron out some system wrinkles, Sumner said, but he noted that this was due primarily to the fact that the product was still in the early stages of development.

FYI

If you're looking for a great place to work . . .

By John Gallant
CW Staff

What could IBM possibly have in common with Walt Disney Productions, Hallmark Cards, Inc., Inland Steel Co., the Los Angeles Dodgers, Mary Kay Cosmetics, Inc. and the Reader's Digest Association, Inc.?

Despite the fact that they operate in widely disparate industries, all those companies are great places to work, according to the authors of a soon-to-be-published book called *The 100 Best Companies to Work for in America*. High-technology firms make up nearly a fifth of the 100 companies, which coauthors Robert Levering, Milton Moskowitz and Michael Katz say are rarely examined from an employee's standpoint.

After whittling an initial list of 350 companies down to 136, Levering, Moskowitz and Katz took to the road to interview employees and garner statistics about the firms. Each of the 100 companies finally selected, the authors say, has something distinctive to offer its workers, whether it be the million-dollar fitness center at Rolm Corp. or the employee vegetable garden at Control Data Corp.'s headquarters.

Along with the biggest "pluses and minuses" of working for each of the 100 best, the three have rated the companies on the basis of pay, benefits, job security, advancement opportunities and ambience. Big and small alike, most of the companies have fostered among workers an attitude of "we're all in this together."

Below are some of the high-tech firms that came under the trio's scrutiny:

■ *IBM* can make its employees feel like giants, the authors say. But those who don't abide by the industry giant's rules — laid down in a 32-page code of ethics — won't last long. According to the authors, few companies of any size can match the benefits or the job security that Big Blue offers. The authors add that IBM is a world unto itself — a world where secrecy is the hallmark. And in that world filled with ardent believers, the nonbeliever may not be very comfortable.

■ You'll get the opportunity to work with a lot of "brainy people" if you're hired by *Hewlett-Packard Co.*, but the authors warn that you may be handicapped if you don't have a degree in electrical engineering or if you're a woman. HP is a model of how a company can grow, prosper and still maintain a personal feeling, the trio writes, and workers are impressed with the company's "playful" atmosphere. Employees enjoy good pay and a good working environment — not to mention the 10 recreation areas HP owns.

■ Work at *Apple Computer, Inc.* and you'll feel like a trailblazer. There's a pot of gold at the end of your trail at Apple, the authors say, but in the end you and the company may be "munched to death by Big Blue." Levering, Moskowitz and Katz claim that Apple's high morale attracts many to the firm, and a subtle 1960s youth

CDLA blames IRS probes for cost hikes

By John Kirkhorn
CW Washington Bureau

ACAPULCO, Mexico — End users are now paying more for computers because of the current Internal Revenue Service investigation of two large third-party vendors, several members of the Computer Dealers and Lessors Association (CDLA) claimed here recently.

As part of a larger review of tax shelters, the IRS announced a few months ago it is investigating the "wraparound" leases and other "tax-advantaged" deals of Comdisco, Inc. and Finalco Corp. The audits are still in process.

Since then, according to the CDLA, investors who provide capital for third-party vendors in return for lease income and various tax advantages have been taking extra precautions and shying away from anything but the safest third-party deals, which do not afford the best rates for end users.

"The threat of an IRS audit is very damaging when you're trying to solicit an equity investment," CDLA President Richard A. Forsythe, who is president of Forsythe/McArthur Associates, Inc. in Chicago, said at the recent association meeting here. "It has become temporarily difficult for promotors to solicit investors. . . . As a result of that, the price of leasing a computer has gone up."

As an example of the effect the IRS investigation is having, association vice-president Robert A. Gulko, president of Unicom Computer Corp. in Sausalito, Calif., said that an end user leasing a $500,000 IBM 4341 is probably paying about $500 a month more on a four-year lease or $1,000 a month more on a two-year lease than he would have paid before the IRS action.

One reason for the price jump, Gulko explained, is that the overhead costs of preparing computer deals are "astronomical compared to what they were." Investors are insisting on much more legal and accounting work on each deal to protect themselves from IRS scrutiny. Moreover, because of "the uncertainty in the investor marketplace, we're seeing transactions that appear to be good, honest deals . . . falling apart."

Although prices for such deals always increase after the year-end rush to close tax-advantaged transactions, "the magnitude of the rise is much greater because of the IRS," Gulko said.

Forsythe speculated that the IRS would not act against the two companies unless it found they had overinflated the value of the equipment in their deals or if they had included fraudulent claims in their prospectuses.

But, he added, the IRS probably cannot give these types of transactions a completely clean bill of health and still continue its campaign against tax shelters. He predicted an eventual "have fence, will straddle" statement from the IRS that will clear the companies but still "leave a little fear of God in the investors' minds."

Lessors fighting new IBM rule

By John Kirkhorn
CW Washington Bureau

Members of the Computer Dealers and Lessors Association (CDLA) are contemplating legal action against IBM to halt what the association feels are anticompetitive actions by the computer maker.

The dispute concerns a three-month-old IBM "end-user certification" program, in which the firm requires all equipment buyers to state 30 days before delivery who will ultimately use the machinery. Third-party vendors — which are IBM's biggest customers — fear that disclosing to IBM who they are dealing with will allow IBM to try to "unhook" those deals in favor of a direct procurement from IBM.

"That's like turning over your best prospect list" to your competitor, remarked CDLA Executive Director James F. Benton. Added CDLA President Richard A. Forsythe, "It seems to us to be dirty pool."

While CDLA members said they do not know of any IBM attempts to take advantage of the situation to swing deals to IBM Credit Corp., they claimed the possibility is there. CDLA Vice-President Robert A. Gulko, who is president of Unicom Computer Corp. in Sausalito, Calif., said IBM sometimes offers a better delivery date to a customer it knows is negotiating with a third-party vendor.

The association executives said the new program is monopolistic and possibly in violation of the 1956 consent decree between IBM and the U.S. Justice Department, which in part said IBM cannot force equipment buyers — in this case third-party vendors — to disclose how the machines will be used.

IBM: 'Nothing new'

IBM, for its part, argues the program is nothing new. Company spokeswoman Nadine Fletcher explained at IBM headquarters that before December all volume buyers had to provide a certification. The new program merely brings all end users under that requirement, she said, noting third-party vendors have always had to disclose end users at some point so that the equipment could be shipped.

The change is necessary, she said, so that IBM can be sure it is treating equally all end users qualifying for volume purchases. "This is nothing new. This has been done all along," she said, adding, "In any event, end-user certification will not be used to disengage the leasing companies' leases."

The association and IBM are meeting to try to resolve the conflict, short of taking the matter to the Justice Department or a federal court. Forsythe said recently that "if there is no business solution to it, you will see some litigation."

Both parties expressed optimism that the matter will be resolved amicably within the next few months. Asked if IBM thinks the dispute can be settled by the talks, Richard M. Hayden, IBM director of industry relations, said, "It's in process right now; it's not too appropriate to comment. Obviously, we hope so."

If some legal action does ensue, it would have to come from an individual company claiming to have been damaged by the program rather than from the association, Forsythe said. According to a CDLA executive, "there are several large members with large resources" ready and willing to take on IBM in court.

Forsythe estimated CDLA members will buy between $6.5 billion and $6.5 billion worth of IBM products in 1984. "While we may have terrible differences with IBM, and we do, and while IBM may have terrible differences with us, and it does, we are not sure we want to call off the game," he said. Because of the association members' large investment in IBM equipment, they are concerned about the company's health, he said.

"As an American, I would love to see IBM prevail in the world computer market," Forsythe said. He added, however, that with increasing Japanese presence in the U.S. marketplace, and with a large unregulated market in telecommunications equipment developing, third-party vendors may find businesses with products that are more attractive than IBM products, especially if they feel IBM is making it difficult for dealers and lessors. For now, he said, the two parties need each other.

Speaking of IBM-CDLA relations in general, Forsythe said, "IBM is a legitimate corporation. It's not going to take unfair advantage." He added, however, that the certification program is just one more action in a long line the association and end users find objectionable and overbearing.

When you need an extraordinary printer on a budget that isn't extraordinary, get Southern Systems QT.

At 300, 600, 1000 or 1200 lpm, the QT Series of printers are extraordinary in performance, in standard features and in cost-savings.

Southern Systems, the leading add-on printer supplier, created the QT Series to meet your extraordinary requirements, including:

- the ruggedness for heavy-duty, DP production
- operator-changeable steel bands
- excellent print quality
- quietized cabinetry
- superior forms alignment capabilities
- guaranteed compatibility with most major computers (DEC, DG, Burroughs, IBM, Hewlett-Packard, TI, Perkin-Elmer, Honeywell and others)
- the reliability of SSI-designed, SSI-produced system controllers and communication interfaces
- plus many more features that Southern Systems will discuss with you in detail. Call **(800) 327-5602** today to discover more about the extraordinary QT printer systems.

Gould adds Concept 32/97, its largest CPUs to date

By Tom Henkel
CW Staff

FORT LAUDERDALE, Fla. — Gould, Inc.'s Computer Systems Division last week unveiled its line of largest processors, the Concept 32/97 series. Available in three basic models, the superminis are said to offer a maximum internal throughput of up to 10 million instructions per second (Mips).

Designed for scientific and engineering applications, the entry-level Concept 32/9705 boasts a four-stage instruction pipeline architecture and 4M to 16M bytes of main memory. It reportedly sports an internal performance of 4.67 Mips and comes with a standard 32K bytes of cache memory, which can be doubled with a 32K-byte expansion module.

Gould also announced a 128K-byte Shadow Memory Module which can be used in place of the 32K-byte cache memory expansion module. A user-definable cache memory option, the Shadow Memory Module can improve a user's performance in applications that require a predictable outcome, Gould said.

The 32/9705 CPU cabinet contains two chassis. A CPU/Logic chassis has a total of 38 slots including 21 CPU slots and 17 slots for attachment of devices under the firm's Selbus. Fourteen Selbus slots are available for expansion beyond the 32/9705 configuration.

The second chassis, the I/O Expansion Chassis, offers eight slots plus a line/printer floppy controller and a diagnostic processor.

An intermediate model, the 32/9750, is virtually identical to the 32/9705, but offers 18 additional I/O slots for applications that require additional interfaces or I/O devices. Both the 9705 and 9750 are field-upgradable to the top-of-the-line 32/9780 system.

The 32/9780 is a tightly coupled multiprocessor which Gould said offers internal performance of approximately 8.4 Mips.

Like the 32/9705, the 32/9780 offers 4M to 16M bytes of main memory. It consists of a central processing unit and an internal processing unit. Both processors carry equal processing power, noted Gould's Hank Taylor, manager of product planning; if one processor fails, the remaining processor can take over the entire processing load.

Each of the two processors in the 32/9780 is equipped with 32K bytes of cache memory, which can be expanded to 64K bytes per processor. In addition, each processor can accommodate one or two Shadow Memory Modules, making the shadow memory capacity 128K or 256K bytes.

Besides announcing the processors, Gould last week unveiled a Multiply Accelerator option for the 32/9705, 32/9750 and 32/9780. The feature is a two-board performance accelerator incorporating both floating-point and fixed-point processors. According to Taylor, the Multiply Accelerator adds an extra 1 Mips of performance to the processor.

The 32/9705 and 32/9750 can accommodate one Multiply Accelerator, and the 32/9780 can handle two units. A 32/9705 equipped with the Multiply Accelerator has an internal performance of roughly 5.6 Mips; a 32/9780 configuration equipped with two Multiply Accelerators offers a maximum internal throughput of 10 Mips, Taylor said.

Like other members of the Concept 32 line, the 32/97 models support Gould's proprietary MPX-32 real-time operating system. They also support Gould's version of the Unix operating system, called UTX/32.

An entry-level, 4M-byte 32/9705 costs $245,000. The price of the 32/9750 intermediate processor begins at $229,000, and the 32/9780 has an entry-level price of $309,000. A top-of-the-line 32/9780 system with dual Multiply Accelerators and 128K bytes of cache memory costs $496,000.

The processors are available 90 days after receipt of order. Gould's Computer Systems Division is located at 6901 W. Sunrise Blvd., P.O. Box 9148, Fort Lauderdale, Fla. 33310.

GOULD from page 1

The Powernode 6030 can support 2M to 6M bytes of main memory. The larger Powernode 6050 and 6080 accommodate up to 16M bytes of main memory. Other features of the Powernode 6000 family include 32K bytes of dual cache memory per processor, four-stage instruction pipeline, instruction and operand prefetch and base register support, Gould said.

Communications features reportedly include the Department of Defense's standard Transmission Control Protocol/Internet Protocol for interaction within a Unix-based network and the ability to link with Xerox Corp. Ethernet networks.

One feature of the Powernode processors that Gould claimed offers users a distinct advantage over the VAX is their size; a spokesman noted that the processors occupy about one-third the floor space of a VAX. For example, the PN6030 is packaged in a cubed cabinet 30 in. on a side. An 80M-byte Winchester disk drive and a removable 60M-byte magnetic tape cartridge drive are integrated in the 30-in. cabinet.

The more powerful PN6050 is packaged in a 71- by 29- by 30-in. cabinet. The unit is field-upgradable by adding expansion boards and peripherals to the top-of-the-line PN6080.

Gould said only the PN6050 is field-upgradable to the PN6080. This is done by adding a Gould internal processing unit to the PN6050, resulting in 80% more processing power, according to the company.

Prices for the PN6030 start at $80,000, for the PN6050 at $115,000 and for the PN6080 at $150,000. The products are available within 90 days of receipt of order, according to Gould's Computer Systems Division, which is based at 6901 W. Sunrise Blvd., Fort Lauderdale, Fla. 33310.

Bell Labs, HP and IBM among the 10 best places to work

Among the high-technology companies, which are the best of the best employers?

According to the authors of *The 100 Best Companies to Work for in America*, Bell Laboratories, Hewlett-Packard Co. and IBM are among the 10 best U.S. firms for workers.

Only HP is listed among the 10 best paying companies, and Apple Computer, Inc., Bell Labs and IBM are among the 10 best for benefits. When it comes to job security, Digital Equipment Corp., HP and IBM are among the prestigious 10 best. Tandy Corp. and IBM are represented in the list of the 10 best companies for job advancement.

But what about the truly important things in life, such as ambience? If it's ambience that you want in a high-tech firm, then you should apply to Apple and HP, say coauthors Robert Levering, Milton Moskowitz and Michael Katz. If you're looking for a company with a country club, send your resume to IBM, which maintains two such recreational facilities that employees can join for just $5 a year.

Which companies are noted for throwing the best employee parties? HP and Tandem Computers, Inc., where the authors say the Friday afternoon "beer bust" has become a hallowed tradition. Control Data Corp. gets the high-tech nod for best employee vegetable garden, and Rolm Corp. and Tandem Computers rate among the best for company-paid sabbatical plans.

If you're looking for the best vacation plan, you're in the wrong industry. No company can beat Reader's Digest Association, Inc. for vacations, the authors say. Besides, who could complain about working in a place called Pleasantville?

GREAT from page 1

culture pervades the work place. Not everyone fits in with the microcomputer giant, but those who do benefit from Apple's strong "share the wealth" attitude.

Vegetable garden notwithstanding, *CDC* is a "leader in corporate social responsibility," the authors report. CDC does not exactly attract flamboyant employees, but is more a haven for "YMCA-type do-gooders — provided they possess a strong Calvinist interest in making money." CDC doesn't believe in the relaxed and informal atmosphere of Silicon Valley high-tech firms; suits and ties are a must. But workers are also able to take advantage of the company's extensive employee assistance programs.

People communicate on a first-name basis at *Digital Equipment Corp.*, according to the authors, but for a large organization, DEC lacks structure. DEC is described as an "Eden for engineers," but the "looseness" of the company offends those engineers who want things run by the book.

Send your resume to *Bell Laboratories* if you want to work at what Levering, Moskowitz and Katz describe as the "frontier of knowledge." But there's a tension at the company which derives from the desire to do research and the need to produce a product for the parent company — AT&T. You probably won't get hired anyway; some workers say you have to be able to walk on water just to get to the interview stage.

The 100 Best Companies to Work for in America, scheduled for release this May, will be published by the Addison-Wesley Publishing Co., which is located in Reading, Mass. 01867.

How do you spell relief from the pain of Documentation? (S-Y-D-O-C.)

Call (201) 568-9700.

Cut your COBOL Maintenance costs.

SYDOC:
STRUCTURED DOCUMENTATION SYSTEM FOR OS/VS

QUESTION: Which is a bigger headache? The COBOL-documentation problem or the high-cost-of-maintenance problem?

ANSWER: Both.

* * *

We're not kidding. Documentation and high maintenance costs are both parts of the same big headache. Here's why:

1. THE PROBLEM BEGINS WITH DOCUMENTATION: And it begins right at the program-development stage.

Most programmers hate to document. And although they may think they are producing well organized programs, they really have no way of judging. If they produce badly organized programs, they will inevitably produce badly organized documentation, too. One always equals the other.

2. BAD DOCUMENTATION LEADS TO COSTLY MAINTENANCE: Even if the documentation started out being accurate, it's probably never been updated. When modifications occur, someone's got to go back and attempt to divine the underlying logic before new code can be inserted. A long and costly operation.

No wonder COBOL maintenance may consume as much as 75% of your entire budget!

FAST RELIEF WITH SYDOC: Our Structured Documentation System takes the documentation problem off the shoulders of your programmers and puts it where it belongs—on the computer:

- **SYDOC HELPS YOU DEVELOP STRUCTURED PROGRAMS.** It not only provides structured documentation, it is also a very useful guide for the production of structured COBOL programs. Flaws and inconsistencies can be spotted at the development stage. And corrected before they start driving your maintenance costs up.

As a manager, you will—for the first time—have a tool to standardize both your documentation and the quality of your programs.

- **SYDOC MAKES IT EASY TO MODIFY EXISTING PROGRAMS.** It can analyze "orphan" programs without adequate documentation and tell you everything you need to know about the program's structure, logic, variables and relationships. Armed with this knowledge, the maintenance problem shrinks.

No longer is it necessary for skilled programmers to spend days searching for clues about the program's logic. SYDOC makes all necessary information available quickly and easily.

But the best way to find out about SYDOC is to try it. If this remedy doesn't work you'll just have to try another—A-S-P-I-R-I-N.

Big Apple at the core of bypass technology

By John Dix
CW Staff

NEW YORK — New York is perhaps the single best place to put a finger on the pulse of "local bypass" — local telecommunications services provided by companies other than entrenched telephone companies.

Because of the heavy communications traffic generated by the high concentration of corporations on the two- by 13-mile island of Manhattan, this city has become a proving ground for bypass technologies. Today the Big Apple is home to the most successful CATV-type data service, as well as the first operational digital termination system (DTS) in the country.

While still a neophyte industry even here, bypass is causing New York Telephone to take furtive glances over its shoulder and has spurred ambitious plant construction plans that the telephone company hopes will help it meet bypass' challenge.

MCTV spearheads

Spearheading that challenge are Manhattan Cable TV (MCTV) and Local Area Telecommunications, Inc., companies with operational bypass systems in place. MCTV, which began experimenting with data services in 1974, operates a CATV-type data network that is separate from its entertainment network. The two networks are managed and maintained by individual staffs.

Carl Gambello, MCTV's director of corporate development, said that the data network generated $1 million in revenues in 1983 (as opposed to the nearly $40 million made by the entertainment side of the house). The services it offers include point-to-point and multipoint data links supporting both asynchronous and synchronous traffic at speeds that range from 1,200 bit/sec to 1.54M bit/sec. Service fees are charged at a fixed monthly rate depending on the protocol used and the data rate.

Most of MCTV's bypass customers are using 9,600- and 19.2K bit/sec circuits, but recent requests have been for the 56K and 1.54M bit/sec service, Gambello noted.

A user that wants to tap into MCTV must absorb the cost of installing the link between its building and MCTV's trunk cable. That can be an expensive proposition. Depending on how close the trunk is, street-cut costs alone can range from $6,000 to $12,000. Running wire up inside a building to the appropriate location will cost an additional $550 per floor, Gambello said.

This type of commitment means that the service will be attractive to customers who can absorb the initial connection costs and see the long-term benefits of using cable. According to Gambello, the benefits of using MCTV's bypass service include contracts that can be as long as three or four years (particularly significant now, given the rate fluctuations of other services); high-speed services; a guaranteed bit-error rate of 10^{-9}; an estimated 99.9% uptime and a two-hour response to service calls; and the provision of service to customers within a maximum time frame of 90 days.

As an alternative to New York Telephone, MCTV provides only local data services and does not presently interconnect with any other carrier. Gambello said, however, that discussions have taken place with Satellite Business Systems, MCI Communications Corp. and ITT about the possibility of interconnecting their long-distance facilities with MCTV. He anticipates that a deal with one of these companies will be made within a year.

A newer company than MCTV, but one chasing the same carrot, is Local Area Telecommunications, Inc. (Lati). Lati began operation last year as the first DTS carrier in the country to bring its service up.

The company's first node in New York is located on top of the World Trade Center. From an antenna there, microwave service is provided to users with small send/receive antennas. Dedicated links' services include the usual data rates ranging from 1,200- to 1.54M bit/sec and above.

Lati President Perry Spirakis would not disclose his company's revenues nor its number of customers, but he said that the Securities Industry Automation Company, a subsidiary of the New York Stock Exchange, was its first client and presently leases 10 9,600 bit/sec circuits.

Spirakis eventually hopes to operate three or four interconnected nodes in New York.

Cutting them off at the pass

Lati and MCTV are carriers that hope to compete with New York Telephone in what Bob Helgesen, division manager of network planning for the telephone company, calls "economic bypass" — competition based on the cost of providing service.

Helgesen believes the best defense against bypass is a strong offense: "We must avoid providing incentives for bypass, and the best way to do this is to install the best technology available where it is most strategically needed."

Demand in the telephone business is traditionally felt at the central office, the switching point at which all telephone lines terminate. Because of this reality, the weak link in the system is seen as the trunks between central offices, which had limited capacity.

To breach that bottleneck, New York Telephone decided to interconnect its many switching centers in the city by installing fiber-optic cables. This would enable the carrier to offer higher speed services to its users while passing on some of the benefits of this type of medium — among them low-bit error rates and bandwidth enough to conduct video-conferences.

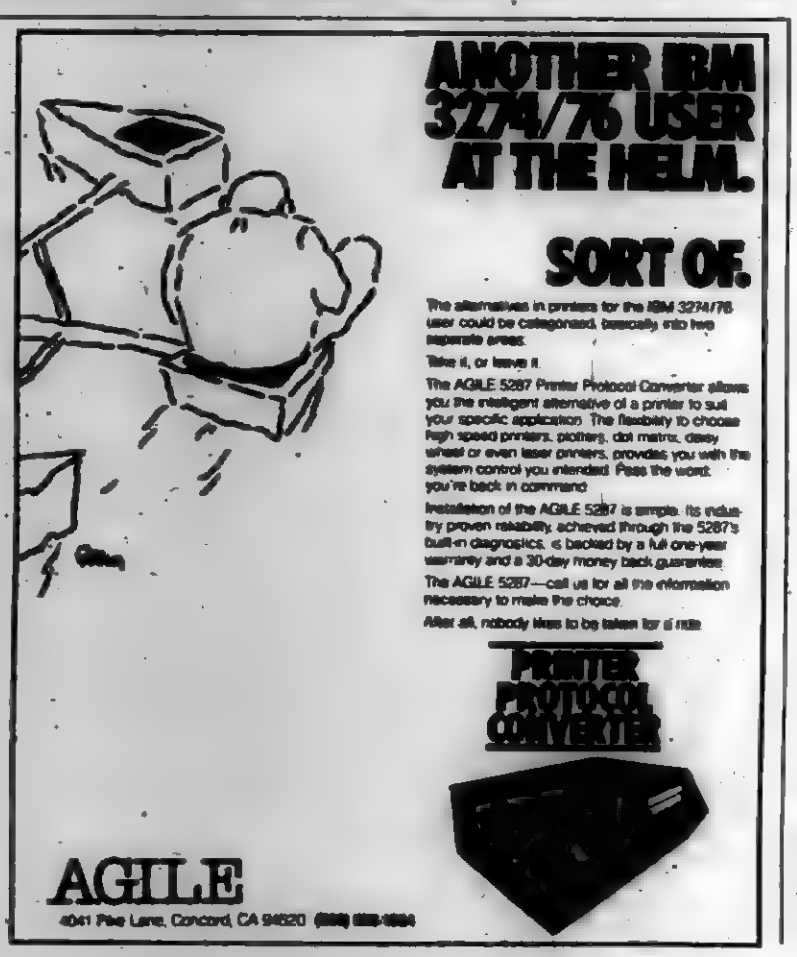
Fiber-optic projects

The first fiber-optic project undertaken was the Ring Around Manhattan, a 144-fiber cable that runs 13.2 miles and was completed in early 1983. The capacity of that system was used up so quickly, Helgesen said, that two other projects were soon launched:

- The Video Around Manhattan (VAM) project was designed as an overlay and upgrade to the first ring. Scheduled to be completed in the second quarter of 1985, VAM will include 20 miles of Western Electric Co. fiber cable (144 fibers per cable) that will operate at 135M bit/sec. NEC Corp. electronics will be used in that system.
- Also slated to be in operation by the second quarter of 1985 is the Fiber-Optics Around Manhattan (Foam) project. Representing a major upgrade to the other systems, Foam will consist of 12 miles of Siecor Corp. single-mode fiber cable (96 fibers per cable) driven by NEC hardware. Eventually, Foam will be extended to Staten Island, Queens and Long Island.

New York Telephone is still studying other transmission technologies like DTS, but Helgesen said that given the number of large office buildings in such a relatively compact area, fiber optics seems the way to go.

By upgrading its plant and pricing its services competitively, the company hopes to cut bypass carriers off at the pass.



Lament has familiar ring

BRIDGEPORT, Conn. — Phone users who are singing the blues over the AT&T divestiture now have a hit tune they can hum as they pay their bills. A parody of Neil Sedaka's 1962 hit, it's called "Breaking up is Hard on You."

In the two months since its release, 150,000 copies of the 45-rpm single have been sold nationwide, and the song has been listed as No. 76, with a bullet, on the *Billboard* magazine list of hit records.

But how could it miss, with words like these:

AT&T don't say goodbye
Don't want to use no MCI
You'll pay rates out the wazoo
'Cause breaking up is hard on you.

And these...

I beg of you, don't take my phone,
I want to lease, don't want to own.

Besides complaining of feared rate hikes, the song also takes a poke at phone company service:

Remember when you made a call
And you got through, no sweat at all;
Now you wait the whole night through
'Cause breaking up is hard on you.

The song was penned, reportedly in 20 minutes, by the American Comedy Network here in December and released to the 23 radio stations that regularly use the troupe's recordings of humorous skits and takeoffs on commercials. Radio stations were swamped with telephone calls when they played the song, according to the group's creative director, Bob James, who describes his six-member group's work as "humor with an edge on it."

The phone calls led to a recording contract with a small Boston label. The song James said had started out as "just a joke" was being played by as many as 250 radio stations.

AT&T Media Relations Manager Phil DeLong, meanwhile, said that the company has taken no position on the song, but he feels "bemoaning divestiture is a lot like beating on a dead horse.

"The song we're humming around here is 'Tomorrow'," he added.

Bank pleased with Teradata DBC/1012

Data base machine marks Wells Fargo debut as DBMS user

FIRST USER

By Paul Gillin
CW Staff

EL MONTE, Calif. — When Wells Fargo Bank N.A. installed Teradata Corp.'s DBC/1012 data base computer here in December, it marked two firsts: Wells Fargo became the first user of the large-scale machine and at the same time installed its first-ever data base management system (DBMS).

Wells Fargo has primarily used Vsam files for many years. While the company does not plan to replace that access method with the Teradata machine, it does expect to develop many of its future small- and medium-scale applications on the DBC/1012, particularly those requiring fast turnaround time.

"Wells didn't get involved in the [IBM] IMS mania of the early '70s," said Michael G. Rowloff, vice-president and district manager of the technical services district at Wells Fargo, in an interview from Wells Fargo's northern data center in San Francisco. "We still have over 100 [IBM] CICS applications using strictly Vsam files."

For new information systems requiring fast development, the department uses Information Builders, Inc.'s Focus fourth-generation language, which Rowloff said can be used to build applications in about one-sixth the time required for Cobol. However, DBC/1012's Tequel language makes prototyping and development about twice as fast as in Focus, he said.

Rowloff became interested in the data base machine when he attended a roundup sponsored by Teradata for potential users last year. "We felt they were excellent people," he said. "We were particularly impressed with their ability to achieve fourth- and fifth-level normalization. That was probably the key."

The Teradata computer's relational DBMS model and self-normalization features eliminate the need "to have a number of data base gurus constantly tweaking the system," Rowloff said. In addition, Teradata's claimed capacity of up to a terabyte — one trillion bytes — of storage presented unusual growth potential for a relational system, Rowloff said. "All my disk space combined is less than half a terabyte," he said.

That Teradata is a start-up company did not faze Wells Fargo, either. In fact, Teradata's offer of a four-month, no-obligation test period was superior to anything IBM offers, Rowloff continued. "We were willing to be the first users on this, but our attitude on IBM is not to be among the first couple of hundred," he maintained.

Wells Fargo installed the smallest configuration of DBC/1012 in December. It includes four parallel access module processors, two communications controllers and four Winchester disk packs totaling about 2G bytes of storage. Installation took about two days and presented no unusual problems, Rowloff said.

For its first application, Wells Fargo chose a data center management program that it tested internally, but soon opened the data base to the general programming community. One of the earliest applications included a "difference analysis" program in which about three million item processing balances were input and searched for discrepancies with daily transactions. Another application was a "combined management" program that provides information on accounts which have multiple relationships across divisional boundary lines.

Rowloff said he was surprised by both the speed and flexibility of the system. "We've run some jobs in the difference analysis program that have run in as little as 15 seconds," he said. "That surprised us because it would probably take as long as several minutes in an on-line environment."

Acid test

However, the acid test of DBC/1012 is still to come, Rowloff noted. Wells Fargo plans to install an accounts analysis system sometime in April. The system basically totals a customer's chargeable transactions for a specific period and matches it against the customer's account to determine how much he should be charged. "Essentially, it's a bank's bill of services," Rowloff explained.

The application will be the first to test the Teradata machine against a data base of more than 1G byte and an array of 150 rows by 120,000 columns. "We'll do some things that exercise a lot of that array and see how it does," Rowloff said.

One pleasant side benefit of the machine has been in the area of data security. Because of the relational tabular structure, "you can look at certain records but not at those owned by other [user] IDs," Rowloff said. "That's not available in Vsam and not done well in some older data base systems."

The future of DBC/1012 will probably lie in new applications that require fast turnaround. The company also expects to offer end users some limited programming functions (see story below).

"Our industry is a deregulating one," Rowloff commented. "We're looking at producing as many information products in a year as we have in the last five years put together. Something like this comes at the perfect time as far as getting products out the door quickly."

However, Rowloff reserved judgment on whether machines like DBC/1012 will eventually replace Vsam files. "There's a definite potential, but I don't think we're quite there yet," he said. "But we're carefully watching other companies that have put their production data base on this."

First user planning applications, end-user computing

EL MONTE, Calif. — Although Teradata Corp. claims its recently announced DBC/1012 data base computer is capable of handling large production-scale processing, the first user of the new machine has no plans in that area.

Instead, Wells Fargo Bank N.A. plans to use the computer for fast-changing new applications and for end-user computing.

According to Michael G. Rowloff, vice-president and district manager of the technical services district at Wells Fargo, the data base machine has proven useful for prototyping, due largely to its self-normalizing relational structure and its use of Tequel, a query language similar to IBM's Structured Query Language.

"Once data is loaded into the relational model and you define relationships, you never have to define them again," according to Rowloff. "And it's easy to modify using procedural code."

Tequel allows the user to ask for data in any order, he continued. The language applies the arithmetic and logical operators and then displays the results without further definition.

"It's so quick that you can afford to think before you implement," Rowloff commented. "If the result isn't what you want, you can just throw it out without losing a lot of time."

Rowloff also sees the possibility of using DBC/1012 to gain some valuable on-line information from sequential files. "You could put a large sequential data set out on the DBC, superimpose a set of definitions on top of that and begin to access it with new Tequel programs and gain information from it you couldn't gain in a batch environment," he said. "I could put field definitions into the dictionary and access it randomly, create new views or use any kind of criteria I created in the table definition."

Because Tequel is relatively easy to learn, Rowloff plans to present it to executive-level users in the near future. The presentation will contain a few canned screens of information, but will also allow the data base to be queried on the fly, he said. Ideally, he would like to have users writing simple Tequel queries by the end of the presentation.

"The banking industry is very information-oriented, but we tend to be secretive about what we do in MIS," he said. "Tools like Tequel can be learned very quickly."

NETS from page 1

Other problems encountered stemmed from overoptimistic assumptions about features provided. Sumner said GE was left to contend with issues like flow control, speed recognition and adjustment and certain terminal compatibility concerns.

While, all in all, he is happy with his network vendor, Sumner said it needs to improve the product's ability to handle synchronous communications and, in the near future, will need to address the handling of high-speed interactive graphics.

In contrast to GE's experience, Texas Instruments, Inc. has had to do little modification to its Xerox Corp. Ethernet local-area network, according to William Roberts, manager of communications network support. TI has interconnected three physical sites via remote bridges to make up a single Ethernet. That network supports between 300 and 400 users and supports upwards of 20 hosts.

Attached devices include eight to 10 types of equipment, including asynchronous terminals and TI personal computers.

The primary reason for installing the network was to provide access to multiple host resources from a single workstation, Roberts said. Even at today's rate of device attachment, Roberts doesn't foresee any capacity limitations or network degradation occurring for two or three years.

Part of the assurance that the capacity of that network won't be challenged comes from Roberts' assumption that TI's network won't have to support video applications.

Just the opposite requirement led the U.S. Air Force to install a Wang Laboratories, Inc. Wangnet broadband local network. Dan Gartner of the Air Force's Aerospace Guidance and Metrology Center in Ohio said that although the network is still in the implementation stage, some interesting things have come to light.

These discoveries primarily involve hidden costs. For example, Gartner said, a personal computer attached to a Wangnet needs a separate emulator board for each individual type of host with which it hopes to communicate.

Another cost consideration cited by Gartner was the high cost of the frequency-agile modems needed with Wangnet. He said that an $1,800 personal computer he can get through the Air Force requires a $1,200 modem to connect it to the network.

On the positive side, installation for the Wangnet cable in this, the first of three phases of network implementation, was accomplished below projected cost, Gartner said.

Budgets up this year, managers tell DPMA

But they want increased funds for software, employee incentives

By John Gallant
CW Staff

PARK RIDGE, Ill. — Data processing budgets are up this year, but DP managers would like to see more money allocated for software and employee incentives.

In a survey conducted in January by the Data Processing Management Association (DPMA), nearly 74% of the 200 DPMA members responding said their DP budgets are higher than in 1983. Austin Weber, editor of the DPMA newsletter "Compufax," which published the survey results in its March issue, noted that the members were not asked by how much their budgets had increased. But he added that DP expenditures now total almost 2.5% of the membership's corporate budgets. With respondents' DP budgets ranging from a high of $2.5 million to a low of $300,000, the average DP budget of the organization's membership now totals nearly $1.65 million.

According to the survey results, the increasing DP budgets appear to be riding a wave of top management support. Almost 90% of the DPMA members questioned said management was "supportive" of their budget requests, with most spending increases approved with little or no hesitation.

Personnel outlays account for the largest portion of the DPMA members' budgets — 44% — the survey found. An average of 26% of the DP budget is earmarked for large systems expenditures, both mainframes and minicomputers, and another 12% is targeted toward software spending.

Hardware and software maintenance accounts for 9% of the budget; end-user training takes only a 3% chunk of the total. Spending on microcomputers comprises the remaining 6% of the DP budget.

However, the survey showed that DPMA members are increasingly concerned about retaining qualified DP workers. Weber said a majority of the respondents urged upper level management to "provide more incentives for retaining personnel for longer periods of time." Such incentives, he said, would boost employee morale and reduce the turnover rate. "Overall, I think the most important finding of this survey is the need to cut down on employee turnover," Weber said. "Top management has got to help DP provide incentives to retain employees. That will help make DP more productive within the organization."

Among other personnel concerns, nearly 20% of the DPMA members said they would like to see an increased financial commitment to end-user training.

Another common complaint that DPMA members voiced through the survey, Weber said, is a shortage of funding for software for both large and small systems. Respondents urged top management to allocate more money for software systems — especially those geared toward data security and "productivity enhancement." The DP professionals surveyed said "management must realize that software depreciates with time and is often in need of maintenance," Weber said.

Not surprisingly, 20% of the information systems professionals responding to the survey said that top management "would be wise" to increase the DP budget to 3% to 5% of the total corporate budget. The respondents added that management should also "try harder to understand the unique problems" DP managers face.

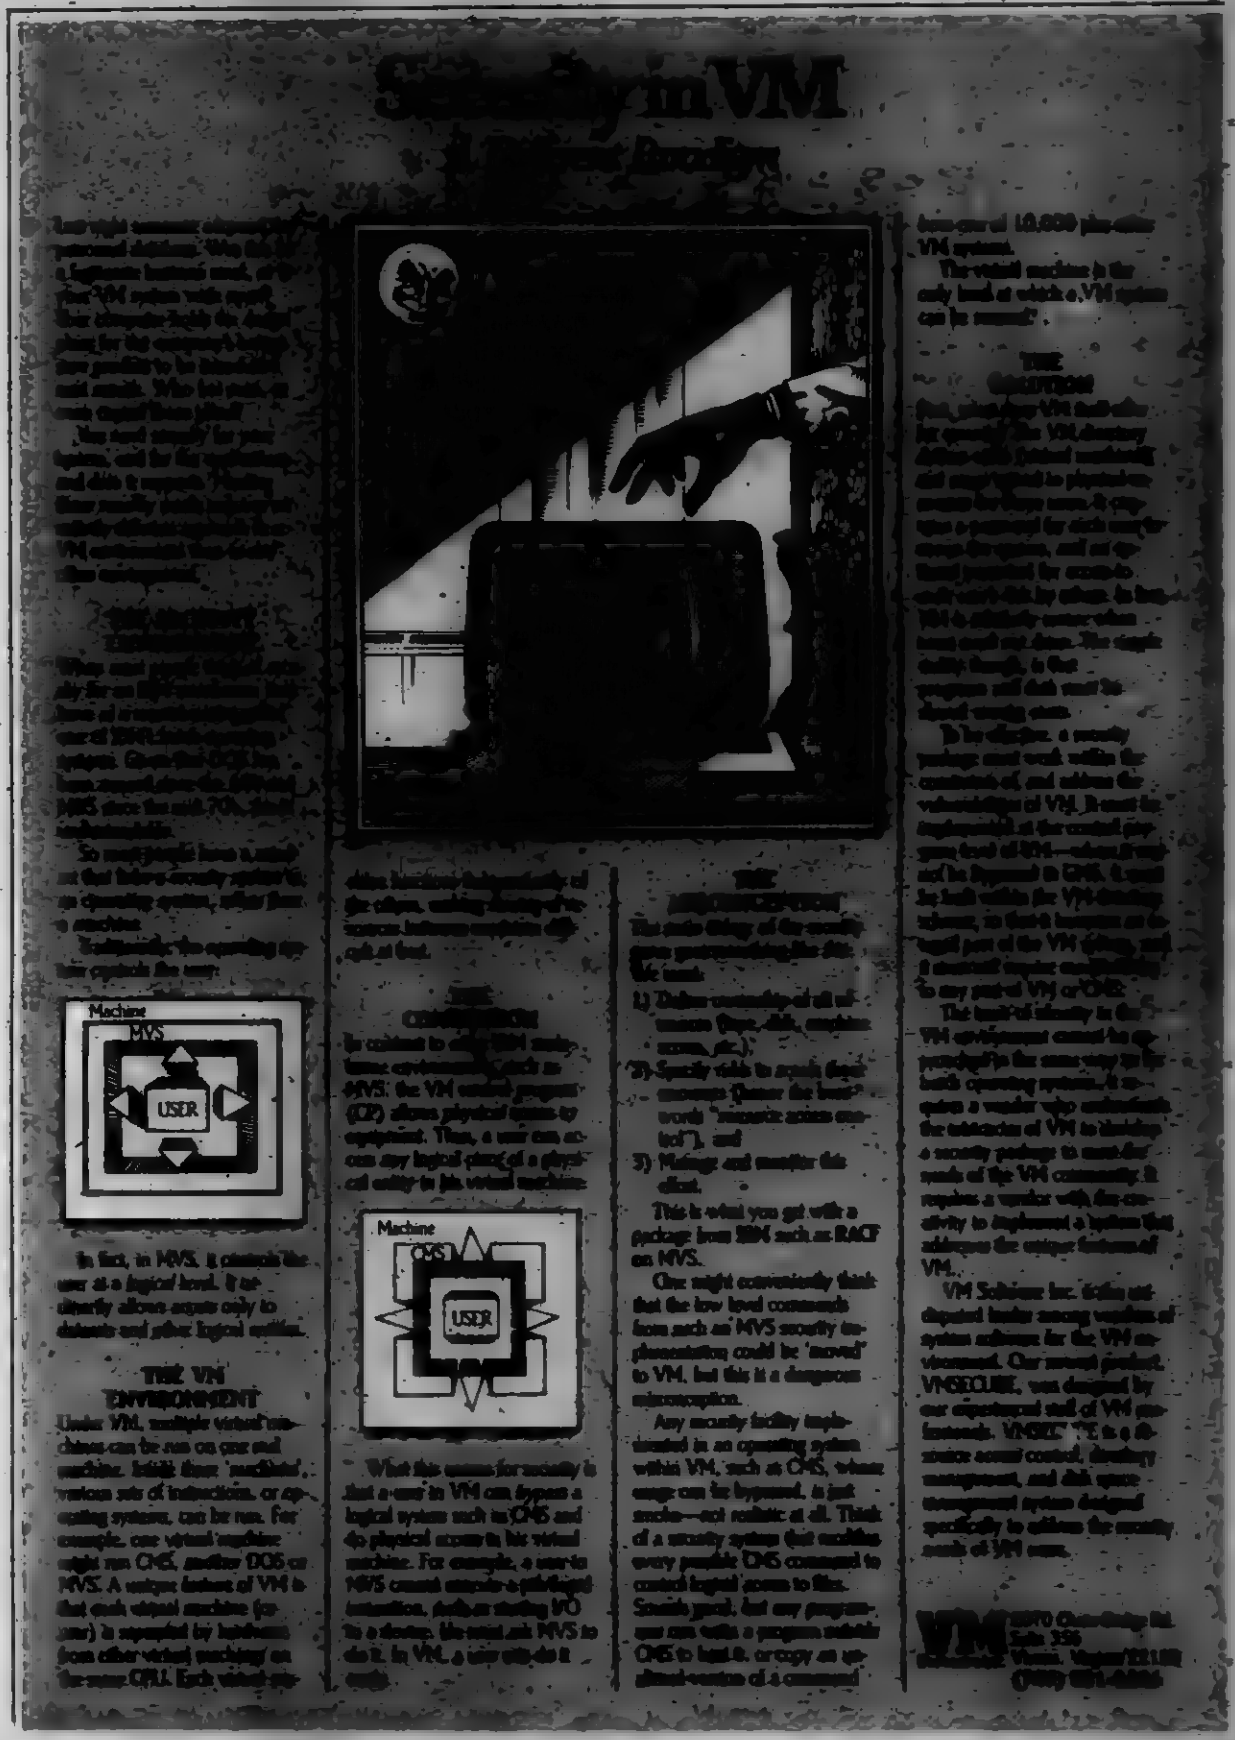
"The point of the survey is to give top management an idea of how DP/MIS feels," Weber said. "I think it shows clearly that there is an inherent need for top management to understand how and why DP managers submit their budgets. There is also a need to allocate more of the total budget for the corporate information resource."

More information about the survey results can be obtained by contacting "Compufax," DPMA, 505 Busse Highway, Park Ridge, Ill. 60068.

CORRECTIONS

"Vendor pulls application generator out of beta test" [CW, March 12] incorrectly stated that Analysts International Corp. had suspended testing at its initial beta site in order to make modifications to its Corvet application generator. While the company has suspended customer shipments in order to make the modifications, beta site testing is continuing.

The March 12 issue of *Computerworld* should have listed American Data Consultants' address as 112 E. 32nd St., Joplin, Mo. 64801.



NEWS

New version of Netway among show debuts

CW AT INTERFACE '84

By John Gantz
CW Staff

LAS VEGAS — Although lacking blockbuster announcements, the Interface '84 communications conference held here last week in the city of glitter featured a number of product introductions from several vendors.

Tri-Data Corp. announced a new version of its Netway product line, components of which it had previously provided only on an OEM basis to other manufacturers.

The Netway 274 Multi-Dissimilar Host Cluster Controller can connect a wide variety of otherwise incompatible workstations and peripherals to multiple and dissimilar hosts, Tri-Data said. Each 274 controller has 16 ports which can be configured to support hosts or terminals, both of which can be supported on a point-to-point or multidrop basis.

The Netway supports IBM 3270 Binary Synchronous Communications and Systems Network Architecture/Synchronous Data Link Control, Burroughs Corp. Poll/Select and asynchronous start/stop protocols.

A typical Netway 274 configuration with eight ports costs $12,510. Deliveries are scheduled for April.

Tridata is based at 2674 N. First St., San Jose, Calif. 95134.

AT&T Information Systems used the Interface show to bring out Level IV of its Dataphone II family of network diagnostics and management control systems. The engine of the new product is actually a stand-alone applications processor, the add-on module used with AT&T's Dimension System 85 private branch exchange.

This device has eight control channels and is said to be able to store up to 3,000 modem/device profiles and records on up to 20,000 faults. By comparison, Level III offered only one control channel and could store profiles on 400 devices and record only 400 fault alerts.

Level IV is fully compatible and integrable with existing Dataphone II products, the company reported. It ranges in price from $96,000 to $125,000, depending on peripherals. Lease costs range from $4,600/mo to $10,000/mo.

AT&T Information Systems is based at 100 Southgate Pkwy., Morristown, N.J. 07960.

Codex Corp. introduced a number of products, the most significant of which was the new 2600 series of modems, built on a bus architecture that is managed by a Motorola, Inc. 68000 microprocessor.

When coupled with a signaling processor based on a custom very large-scale integration chip set and the first commercial implementation of a new modulation technique called Trellis Coding, the top-of-the-line 2660 can achieve data rates up to 16.8K bit/sec in point-to-point applications.

The 2600 series also includes the 2640 and the 2620, which operate at 9,600 and 4,800 bit/sec, respectively.

One of the 2600 series' features is the Adaptive Rate System, whereby the modem will step down to a slower speed if the line it is using begins to degrade, then back up to the higher speed when the condition has passed.

The 2660 costs $13,000, the 2640 costs $7,200 and the 2620 costs $4,175. One- to five-year leases are available. The 2620 is the only product not presently available.

Codex is located at 20 Cabot Blvd., Mansfield, Mass. 02048.

Gateway to 3270

Infotron Systems Corp. went to Interface '84 to announce the Virtual Terminal System (VTS), said to provide a gateway to IBM 3270 applications for Infotron's multiplexer, data switches and network concentrators.

The terminal emulation system enables Ascii and other asynchronous terminals (including personal computers) to work in a 3270 synchronous network, Infotron said. Multiple applications or multiple hosts can be accessed from a single network connection. Devices and hosts are supported at speeds up to 19.2K bit/sec.

Two models are available. The $6,800 VTS 351 handles up to six Ascii devices, and the $7,600 VTS 352 supports up to 12 devices. Both are available stand-alone or in rack-mounted configurations.

Infotron also announced two terminals that are said to be designed specifically for use with the VTS. The 700 and 701 have an IBM 3278-like keyboard, menu-driven configuration capability, an RS-232C printer port with automatic speed detection and display and diagnostic attributes similar to the IBM 3277, 3278 and 3279 display stations, Infotron said.

The 700, which costs $1,100, has a fixed-display format, whereas the 701, priced at $1,750, offers eight user-selectable formats. Shipments are slated to begin in May.

Infotron is located in the Cherry Hill Industrial Center, Cherry Hill, N.J. 08034.

System 1032 for VAX

DBMS Bliss

Now there's software that users can use, programmers can program, and managers can manage.

Don't despair. If you've been frustrated waiting for ideal data management software, your worries are over.

The answer is System 1032™ DBMS for your VAX. And you can sample it at no risk or obligation. Here's the story.

Responsive Assistant

System 1032 provides a common-sense relational approach to data management, without the burden of relational calculus or SQL. Users easily grasp both simple and complex data relationships, and assistance is right at their fingertips. Special function keys make it easy to complete commands, quickly learn new ones, and see explanations of options and parameters, even in mid-command. So there's no need to struggle with a manual in the lap or consult an already-hassled wizard.

Best of all, System 1032 is fast and pretty. It answers complex queries almost instantly and produces presentation-quality reports with single commands.

Designer's Delight

Don't think it's a toy, though. Sophisticated applications designers can program in any VAX language, including System 1032's built-in block-structured language, and still access all of System 1032's powerful data management tools. A complete range of data types, format definitions, shared data structures, and other advanced features ensure that System 1032 easily satisfies the most demanding needs.

If you're a manager, you'll especially appreciate System 1032. Your users and programmers all use the same unified command language and data base concepts, so communication between them is easier than ever. And System 1032's careful human engineering drastically cuts your training costs and increases productivity.

Plus we exploit the best of the VAX architecture with shareable native code, asynchronous I/O, and proprietary inverted files—efficiently! So, unlike other software, System 1032 won't force you to buy more memory, disk space, or CPUs.

Risk Free

Software House has an impeccable decade-long reputation for reliable software and responsive technical support. System 1032 is the offspring of System 1022,™ the most widely used DBMS for DEC mainframes. Its step-oriented commands and relational design have proved themselves in years of use at hundreds of sites. And System 1032 has undergone extensive field-testing to ensure that it works right the first time for you. Although new, System 1032 is already the most mature DBMS available for your VAX.

Convince yourself. Try System 1032 on your own VAX with your own data. A 60-day trial period costs just $85. Verify our claims, browse through our manual, and test our hot-line support service. Compare and benchmark System 1032 against other software, relational or not, at whatever price. Then sit back in bliss and watch your end users and programmers accomplish more, faster than you thought was possible.

So don't delay. Call us today, or send in the bliss coupon.

White House seen proposing telecommunications policy

By Phil Hirsch
CW Washington Bureau

LAS VEGAS — As soon as the telecommunications industry's warring factions reach a consensus, the White House will propose a new national telecommunications policy and work for its adoption.

This was the view of Alfred W. Van Sinderen, president of Southern New England Telephone Co. (Snet), who delivered the keynote address here last week at the Interface '84 communications conference.

The prediction that the White House will assume an active role in developing national telecommunications policy, Van Sinderen told a press conference following his keynote address, is based on recent talks with officials at the National Telecommunications and Information Administration, the president's chief telecommunications adviser.

Other predictions

Van Sinderen also said at the press conference that:

■ There may be a need for increased government support of telecommunications research because of AT&T's divestiture. The company faces increased competition in the interstate services market, and the divested Bell operating companies are now buying terminal and transmission equipment from other suppliers. By 1986, Van Sinderen said, AT&T's earnings may be reduced to the point where it has to trim the Bell Labs budget.

■ Rivalry between the newly created regional Bell operating companies and AT&T is one reason for the decline of service since divestiture. Another is the difficulty of providing service when personnel and facilities are being shifted and new organizational charts and resource management systems have to be created.

But Van Sinderen expects much less confusion six months from now. When his company receives a service order that requires a sign-off by AT&T, Snet does the work immediately to keep the customer's goodwill, "even though we know it will be six months before AT&T pays us."

■ Digital Termination Services, Inc., a company in which Snet has a 40% interest, plans to begin premarketing its microwave-based digital termination service in Washington, D.C., and one other city — most likely to be Atlanta or Chicago — this summer.

Private network service promised by year-end

By Phil Hirsch
CW Washington Bureau

LAS VEGAS — A new private network service will be tariffed by AT&T Communications before the end of this year, Service Development Director Richard Snowden said here last week.

With the network, users who transmit the appropriate instruction codes on-line to a network control point will be able to reconfigure their networks dynamically at any time, Snowden claimed.

Snowden disclosed plans for the new offering in a talk given at last week's Interface '84 communications conference.

Accunet T1.5 enhancement

The new service, he said, will be an enhancement of AT&T Communications' already tariffed Accunet T1.5 service, composed of leased point-to-point transmission links operating at 1.5M bit/sec. Typically, each link is multiplexed into multiple voice and/or data subchannels.

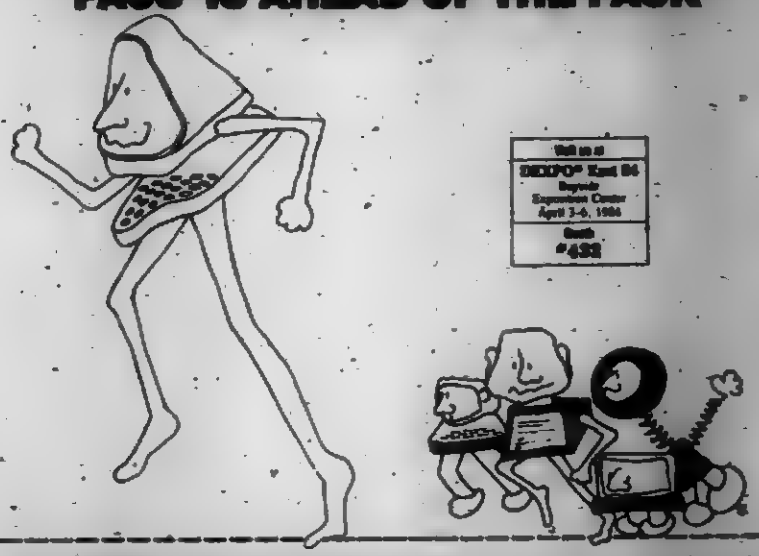
Besides changing the traffic mix to accommodate random fluctuations in message and session volume, the enhancement also will permit the network to be geographically reconfigured. As traffic peaks and valleys occur at various points, subchannels can be reconnected to provide capacity where it is needed.

"Initially, we will offer reconfigurability only with a totally private network of T1.5 subchannels," Snowden said. Later, however, users will be able to interface these subchannels to public voice and data networks; by transmitting the appropriate codes to the Accunet network control point through a teletypewriter, users will be able to connect an individual subchannel to different networks at different times as required by changes in their traffic patterns, or to exploit time-of-day or other discounts, he said.

By providing a dynamically reconfigurable transmission path for voice, data and image traffic, the service should make wideband more economically feasible for more users. The economics of wideband are likely to become more appealing after the new cost-based tariffs mandated by the Federal Communications Commission become effective. Those tariffs will increase rates considerably for voice-grade private lines.

Snowden said the Accunet T1.5 service exemplifies a major objective of AT&T Communications during the 1980s: To provide customers with the capability to manage their transmission facilities directly. He indicated there will be further offerings embodying this same idea.

FOR VAX™ RESOURCE ACCOUNTING, PACS™ IS AHEAD OF THE PACK



The competition isn't even close. PACS is so good, it's the only resource accounting package in DEC's™ EAS library. Here's why:

- Flexible billing algorithms
- User budgeting and port speed accounting
- EZLOG™ for true 3-level reporting by account, project and user

McAuto tells how it's controlling micros

CW AT INTERFACE '84

By Phil Hirsch
CW Washington Bureau

LAS VEGAS — At least one large company has managed to control the internal use of personal computers throughout its organization, attendees at last week's Interface '84 conference here were told.

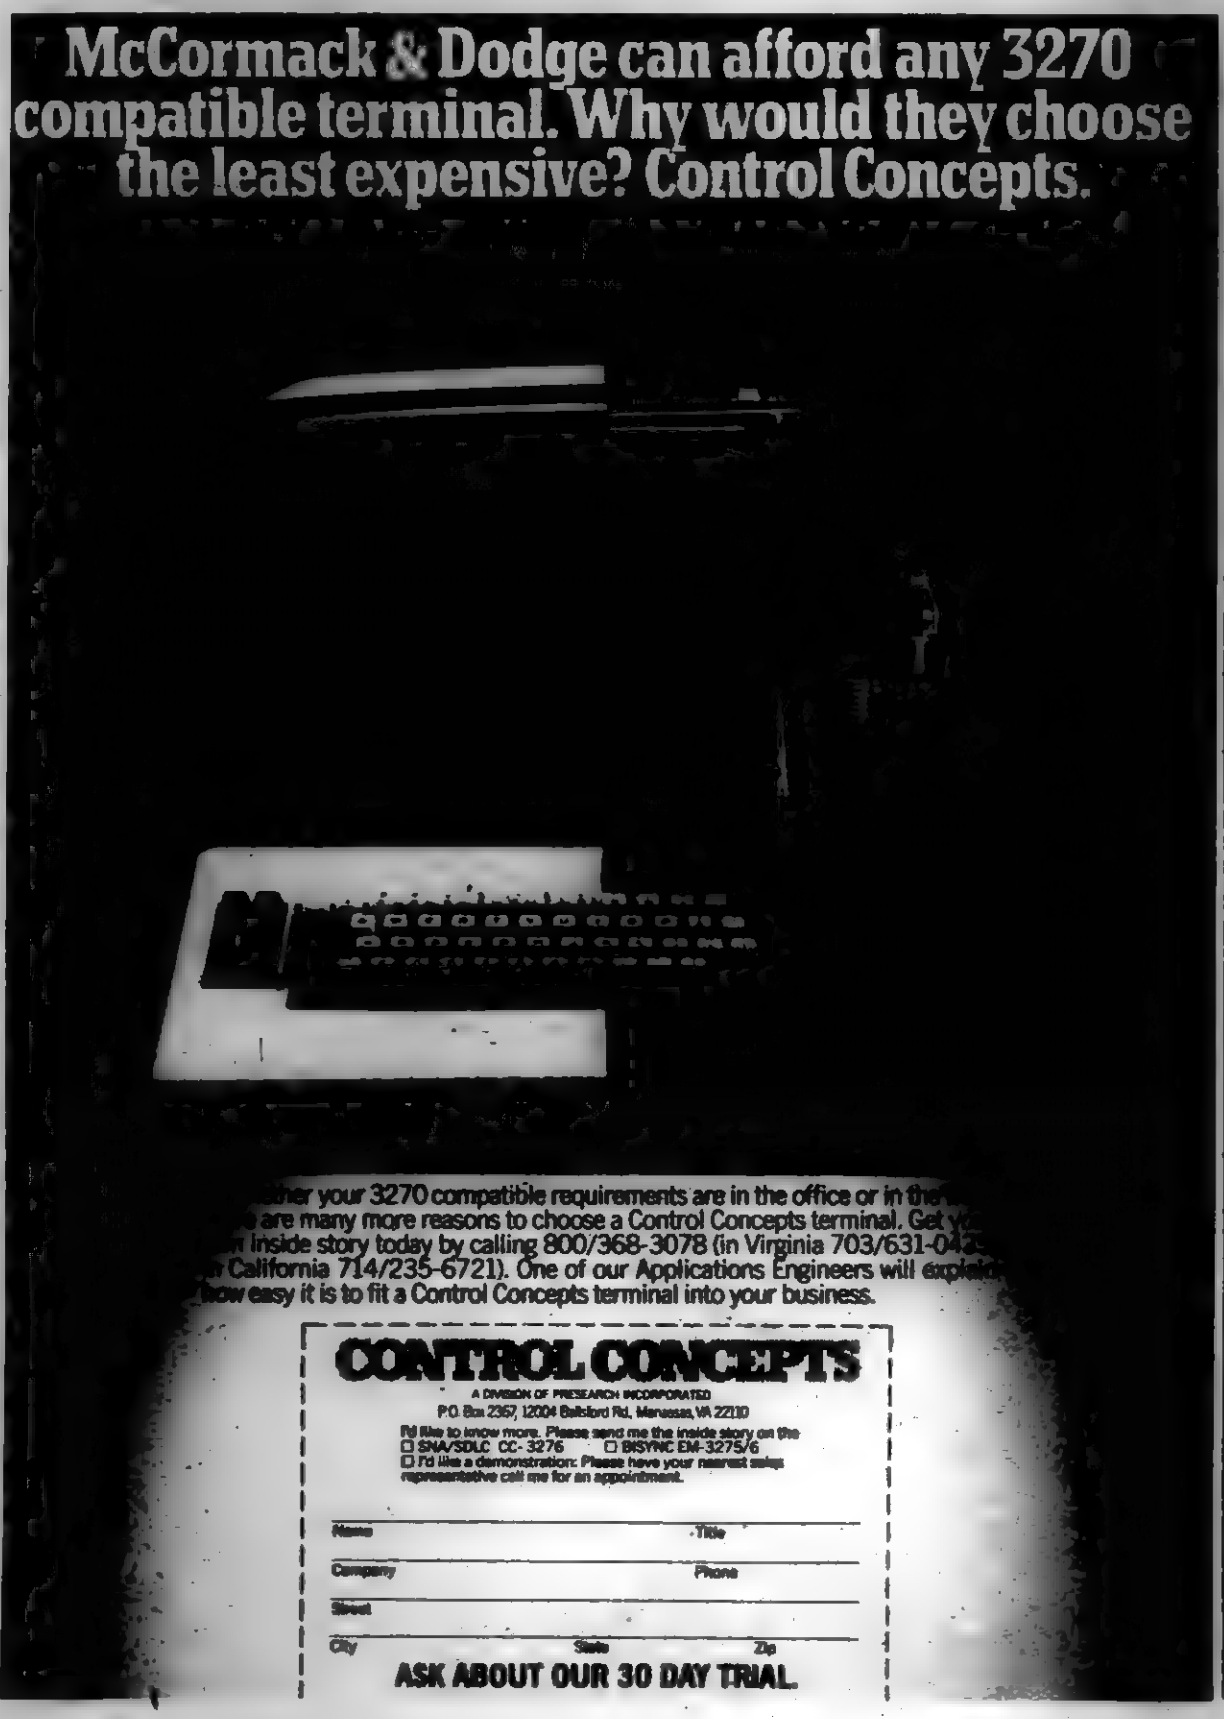
R.D. Greco, director of information resources management for McDonnell Douglas Automation Co. (McAuto), said his company began looking at personal computing about 18 months ago. At that time, McAuto's information system, based on large, centralized IBM mainframes, began breaking down. Partly because of corporate acquisitions, demands on the system changed qualitatively and increased quantitatively, Greco said. As a result, it became increasingly difficult for users to get jobs done on time.

The first step toward a solution came when the company decided to decentralize its computer activities. Personal computers immediately became a very attractive option, Greco said, but problems quickly developed. Swarms of microcomputer vendors suddenly appeared; biases for and against particular personal computers surfaced within the company, and there was growing concern that McAuto would end up with chaos — multiple personal computers and programs that would not be able to communicate with each other.

The problems were solved, he said, by:

- Setting up a technology review group to analyze and then specify the personal computer hardware and software that would be funded by the company.
- Establishing a user support center within each component of the corporation.
- Providing classes for familiarizing users with all the specified products. Heavy use is made of tutorial software developed by outside vendors.

Implementing these measures "brought immediate stabilization to our previously chaotic" computer environment, Greco said. McAuto has installed 350 personal computers so far and plans to add 400 more this year. Half of the latter will be assigned to programmers. Micros offer "significant productivity improvement potential," Greco said.



Session focuses on gateways

By John Dix
CW Staff

LAS VEGAS — IBM will make its token ring local-area network available when it can offer gateway support for it through its Systems Network Architecture (SNA), probably in the fourth quarter of this year.

That conclusion was drawn by Dan Zatyko, president of Zatyko Associates of Tustin, Calif., at a session on intelligent gateways held here at the Interface '84 conference last week.

The capabilities made available with the introduction of the SNA Network Interconnection products this year are "the most significant announcement for SNA since 1978," Zatyko said. They will pave the way for autonomous networks, including local-area networks, within SNA as well as provide for SNA network interconnection, he added.

"We will no longer have one large corporate network trying to serve all needs," Zatyko said. "We'll have smaller interconnected networks."

Getting down to basics, session leader Francis X. Daubeck defined a gateway as a hardware/software component that interconnects two heterogeneous networks; a bridge, in contrast, connects homogeneous networks. In function, gateways provide code and speed conversion, protocol interface compatibility, routing, error recovery and access capabilities, explained Daubeck, who is president and chief executive officer of Communications Network Architects in Washington, D.C.

Other than those discussed by Zatyko, typical gateways are used between vendor-specific network architectures and one of the following: X.25, SNA, Ethernet and some vendor-specific architectures.

Gateways have classically been user-created software interfaces developed to optimize investment in existing but disparate networks, Daubeck said. Like Zatyko, Daubeck said that gateways can "extend a hierarchical network to include a peer-coupled subnetwork and provide peer-coupling for hierarchical networks such as SNA."

Some disadvantages to gateways, however, are that they are complex and degrade network performance to some degree, Daubeck said.

NSF brass asks Congress for national tech agency

WASHINGTON, D.C. — The chairman of the National Science Foundation's (NSF) supercomputer advisory panel said he supports legislation to set up a national technological foundation, which he said could help universities gain access to advanced computing facilities.

Dr. Kenneth G. Wilson, a Nobel laureate physicist from Cornell University, said on March 14 that the $20 million in NSF's proposed 1985 budget for supercomputer research and development support does not address all the needs for academic access to large scientific computer systems.

The NSF "was designed to protect long-range scientific research from short-term political crosscurrents," according to Wilson, who believes "some alternative mechanism does have to be established which would provide a second source of instrumentation grants for universities, especially grants for computing equipment."

Wilson told the House Subcommittee on Economic Stabilization that the proposed Advanced Technology Foundation Act could fill that need.

One provision in the bill would create a foundation to help support cost-cutting applied research to stimulate commercialization of new technology. The foundation would support research centers and find other ways to speed widespread adoption of technological innovations.

This type of agency, Wilson told the subcommittee, could help spur the supercomputer industry "to serve the industrial scientific market more effectively, pursuing research problems — for example in software productivity — where industrial benefits are immediate."

Justice halts firms' sales of 'abusive tax shelters'

WASHINGTON, D.C. — The Justice Department has obtained an agreement halting the sale by two firms of what the government called "abusive tax shelters" involving computer hardware and software leases.

The consent judgment was filed in U.S. District Court in San Francisco, resolving a civil suit brought at the request of the Internal Revenue Service. The defendants were Computer Alternatives, Inc., its president Robert K. Ramers, of Larkspur, Calif.; and John M. Holdaway, of Sandy, Utah, president of Compumaster Financial Services.

The IRS had accused them of selling packages of computer leases worth between $24,950 and $50,328. One hundred and one of the systems were sold in 1982, causing U.S. Treasury losses exceeding $2.2 million, according to documents filed with the District Court.

Because the packages were greatly overvalued, they lacked "economic substance," according to the government, which said, as an example, an investor in the 50% tax bracket could buy a package for $6,995 and take $10,492 off his taxes in credits and deductions.

Under the terms of the settlement, the defendants, who did not admit guilt, agreed to stop selling the packages and notify the IRS of any future tax-advantaged computer lease activities. In addition, Ramers and Computer Alternatives paid a $30,000 penalty, and Holdaway paid a $20,000 penalty.

Despite repeated attempts, neither of the defendants could be reached for comment on the settlement.

CWA adds voice to plea for VDT work place laws

WASHINGTON, D.C. — The Communications Workers of America (CWA) has joined with other segments of organized labor that are asking Congress to pass legislation to ameliorate the working conditions of video display terminal (VDT) operators.

David LeGrande, CWA representative for occupational safety and health, told a House of Representatives' labor subcommittee March 14 that VDT worker complaints of visual, musculoskeletal and job stress problems are frequent and constitute "a dangerous side effect of high tech," warranting "scrutiny by lawmakers."

The Health and Safety Subcommittee has held three days of hearings, taking testimony from labor representatives calling for government action to ensure safe working conditions for VDT operators.

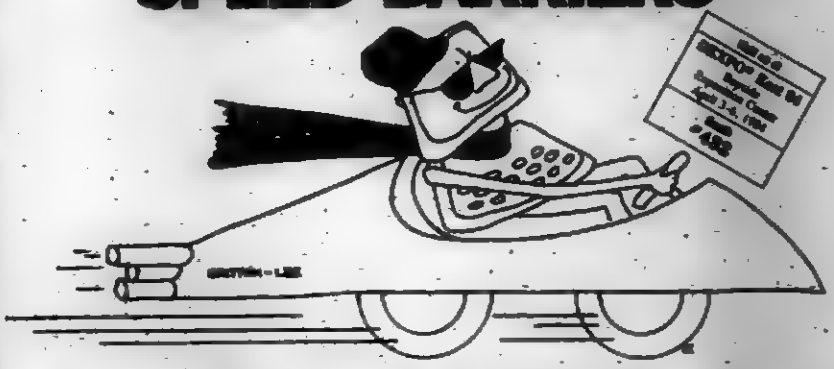
The panel will later hear from representatives of the scientific community and from terminal manufacturers.

LeGrande urged the subcommittee to encourage the National Institute for Occupational Safety and Health to begin comprehensive research projects on a number of possible VDT health hazards, including such areas as visual, job stress and reproductive problems.

He also said the Bureau of Radiological Health should set specific standards controlling the manufacture of VDTs.

Lastly, LeGrande suggested Congress adopt legislation "specific to VDT work environments." This legislation "should provide for the duration of work periods, visual testing, ergonomics, job stress research and protection from potential reproductive hazards and worker participation in the introduction and use" of VDTs.

OMNIBASE™/IDM™ BREAKS VAX™ RELATIONAL SPEED BARRIERS



Signal Technology's OMNIBASE software driving Britton-Lee's IDM database machine is breaking records because it:

- Off-loads your VAX
- Has a much faster user response than software-only relational DBMS
- Dramatically increases productivity
- Has streamlined application development

Info center seen budding under vigilant MIS

Crwth survey summarizes trends, growth

CW At CBT Conference

By Patricia Keefe
CW Staff

CHICAGO — The increase in the growth of information centers during the last three years has typically occurred under the watchful eye of the MIS department in an IBM environment, according to a recent study on information center growth.

"The Crwth Information Center Survey" was conducted by Crwth Computer Coursewares, vendor of interactive computer-based training. It was summarized at last week's Computer-Based Training Conference & Exposition here.

Among the study's findings:

■ The information center is most often organized within the MIS department, with more than half the center managers reporting to the MIS director or manager of systems and programming.

■ The user profile is broken down into business analysts who want decision-making aids (36%), clerical and administrative staff seeking basic information processing skills (25%) and supervisory personnel who need support services (15%).

■ There is no standard method for charge-back, although some respondents indicated that costs and charge-back become more of a concern as the number of users increases.

The study noted that approximately 1,400 information centers have been established since the introduction of the concept by IBM Canada in 1976. Among survey respondents, 37% launched their information centers less than a year ago. The overall number of centers is expected to double, rising to 2,100 installations by the end of this year.

This growth is not without its problems, according to the survey report. Advances in technology that are as new to experienced programmers as they are to novice end users are creating a threat to end-user support.

These technologies include fourth-generation languages, microcomputer software, networking of personal computers and mainframes, distributed data base administration and educational technology, all of which Crwth said has "landed inside the boundaries" of the information center.

The survey also found that although 88% of the respondents have less than 50 personal computers, 40% expect to add 10 to 50 more this year, typically the IBM Personal Computer. Even so, it is estimated that two-thirds of end-user applications involve large departmental or multidepartmental data bases. This suggests that end users' needs may quickly surpass the capabilities of personal computers, Crwth observed.

Other obstacles to information center implementation include a critical shortage of DP trainers, lack of end-user awareness, DP and management resistance and system resource shortages. Crwth suggested the development of an internal marketing program to communicate the benefits of the information center.

Such a program takes on added importance given Crwth's belief that a company's success will ultimately depend upon its ability to train large numbers of end users to use information resources advantageously. "By supporting end-user computing, the information center can play an important role in providing faster, better access to corporate information," the study added.

CBT combating trainer deficit: survey

By Patricia Keefe
CW Staff

CHICAGO — A "critical shortage" of DP trainers is "seriously jeopardizing" efforts to train end users to be self-sufficient in computer skills. However, many information centers are successfully overcoming this obstacle with computer-based training (CBT), a recent study on the growth of information centers found.

Conducted by Crwth Computer Coursewares, a vendor of interactive computer-based training, the study examined some of the obstacles to information center implementation. More than 150 corporations were interviewed in the survey, whose results were summarized by Crwth President Marsha Seidman at last week's Computer-Based Training Conference & Exposition here.

The survey found that the foremost obstacle to information center implementation is a shortage of DP trainers and educational/product consultants. Only 12% of the survey respondents claimed to have sufficient staff.

Moreover, very few of the information centers surveyed have full-time DP trainers or consultants. Adding to these woes are the predictions of a survey by California-based Input, a market research firm, which expects a 400% growth in the number of end users by 1986, outstripping an expected doubling of information center staff during the same period, Crwth said.

"In view of this critical shortage of DP [training staff], this problem may only be alleviated through the integration of state-of-the-art education technology in the information center," the study said. Otherwise, it warned, the information center may grind to a halt if effective alternatives are not found.

Supporting Crwth's conclusions are those information centers (56%) which have already implemented some form of CBT. In fact, the survey found that more end users are trained annually with CBT than without, regardless of staff size.

Among the information centers that do not provide CBT, 38% said they train fewer than 100 users annually, while 30% train more than 200 users a year. Conversely, among centers that do provide CBT, 22% train less than 100 users, and 45% train more than 200 users per year.

Most of the information centers using CBT, according to the survey, said it provided better training availability (97%), decreased scheduling problems (88%), offered more individualized training (94%) and improved their ability to reach remote users (81%).

The "Crwth Information Center Survey" is available free of charge to DP trainers and information center management from Crwth Coursewares, Suite 200, 613 Wilshire Blvd., Santa Monica, Calif. 90401.

CBT developers urged to focus on people needs

By Patricia Keefe
CW Staff

CHICAGO — Developers of computer-based training (CBT) products need to focus more on the diverse needs of people, developing adaptable systems to meet those needs.

"We have to learn how to make the instructional process conform to each learning personality instead of the other way around," Serge Beauregard, chief technologist and executive vice-president at Deltak, Inc., told attendees at the Computer-Based Training Conference & Exposition here last week.

Ideally, a balance must be struck between the student's and the system's control of the training. "We need an instructional medium that knows when to let go and when the student is out of control," he said, touching upon an issue that surfaced repeatedly during the conference.

See CBT page 15

CBT strategy shown to reduce training costs

CW AT CBT CONFERENCE

By Patricia Keefe
CW Staff

CHICAGO — Christopher L. Howey is a person who once practiced what he now preaches: the use of a carefully orchestrated computer-based training (CBT) strategy to reduce training costs.

Speaking before a cost-conscious flock at the Computer-Based Training Conference & Exposition here last week, Howey related his experiences in developing a cost-effective training strategy for Arthur Andersen & Co., where he is a CBT specialist.

It is not enough to know that CBT will cut costs, Howey said; proof is usually needed to convince management. Toward that end, Howey developed a methodology for examining CBT from a cost perspective.

"You want to be able to leverage capital and labor costs," he stated, and break those costs down into the four models of training delivery systems:

- Low-technology/low-labor, typically text-based self-instruction.
- High-technology/low-labor, typically computer-aided instruction alone, where few people, but a lot of equipment, are required to deliver the service.
- Low-technology/high-labor; this is an instructor-led classroom.
- High-technology/high-labor, typically the use of expert systems as job aids in work environments requiring a large labor force.

To determine which model best fits an organization's needs, Howey suggested asking how many people will be serviced, whether the course content will be stagnant over a long period and how important are other issues such as standardization of technology or instruction. Also to be considered are the pros and cons of the costs of various training alternatives, such as centralized, labor-intensive options (traditional training methods or sending people to a centralized training site); decentralized, capital-intensive options (computer-intensive training); and decentralized, labor-intensive methods (sending staff to training sessions outside the company).

CW Photo by P. Keefe
Howey

Another issue concerns the cost phases of actually developing a training program. Ticking off the three phases — design, development and delivery/maintenance — Howey urged his listeners to look out for recurrent expenditures.

Cost estimates should also be formulated, he suggested, for the participant-to-instructor ratio, the faculty ratio (how many faculty members of what type are required to teach) and the different classifications of participants, who create different billable rates. Other fixed costs include transportation, technology and production, according to Howey.

One area of cost that may be overlooked is what Howey called "lost-opportunity costs."

"The single thing that is able to justify CBT is lost-opportunity recovery, in terms of salary and travel time," he said. A shorter, more precise training period will provide a shorter payback in terms of increased productivity, he explained.

CBT from page 14

Many speakers and attendees here lamented the inflexibility of many systems that will not allow users to back up or skip over nongermane material.

Equally important is the training program's perception of who is on the other side of the screen, Beauregard said. "You have to understand that there are some limitations to a system that doesn't know whether the student is awake or asleep," he added.

Noting that each individual has a different learning profile, Beauregard predicted the development of CBT systems that take into account the aptitude, cognitive style (graphic vs. verbal orientation), motivation and personal biography of each student. To develop intelligent systems of this type, it will be necessary to "raise the IQ level" of computers, he said.

Before that can happen, however, changes will have to occur in some areas of technology, he said.

Those changes include an increase in computer "horsepower," from desktops to IBM 4300 series systems, in order to design, conceive and create more responsive learning environments; a dramatic increase in available memory; the development of a learner's "workbench" environment; and an authority system that can weave together all the parts.

These changes will open the door to the development of more expert knowledge-based systems based on artificial intelligence, he said.

Expert systems differ from such standard systems as payroll in that they can "learn" from experience, offering a diversity of information that was not in the original program; provide the combined expertise of many professionals; and use intuition in making judgements.

Attention DEC® Users:

See how MTI can save you $5,260 on your next 300 lpm matrix printer.

DEC LXY12
$11,250

MTI's CI-300
(CIE Terminals)
$5,990

That's $5,260 less than the DEC LXY12, and the price includes DEC controller, cable, universal power supply, pedestal and paper basket.

MTI's CI-300 is a DEC plug-compatible LXY12 emulator. And it's a lot more printer for a lot less money. It features a resolution of up to 400 dots per inch in letter-quality mode, and up to 200 dots per inch in graphics mode. Ask your MTI salesman for information on its many advantages and superior performance over the LXY12. We are authorized distributors of CIE Terminals, and can enhance your DEC system quickly and efficiently.

Whether you lease, buy or rent our equipment, you'll find MTI is the one source for all the terminals, peripherals, systems, applications expertise and service you'll ever need. At great prices. Call us today.

Source code control is only one step in software configuration management.

Softool's Change and Configuration Control (CCC™) takes you all the way to full configuration control!

CCC automates: Management of changes and configurations, control over who makes what type of changes and where, tracking of trouble reports, reconstruction of previous versions, management reports, archiving, and all the remaining "steps" to total configuration control.

CCC is supported on the DEC VAX, DG MV, Gould S.E.L., Honeywell 6000 (Level 66 and DPS 8), HP 9000, and IBM 370, 30XX and 43XX computers.

There is more. CCC is a stand-alone component of SOFTOOL®. An integrated Programming Environment (PE™) is also available.

CCC is interactive and friendly. It supports all programming languages, and comes with on-line tutorials.

If you want true configuration control, where all components of a given release can be managed as a unit, there is only one choice: CCC.

Available now! Over 1000 Softool products are installed worldwide.

Call for more details or a hands-on demonstration.

Consultant warns of inherent risks of CBT

Trainers need clear grasp of forces involved in CBT implementation

CW AT CBT CONFERENCE

By Patricia Keefe
CW Staff

CHICAGO — Advocating change in any corporate operation can be pretty risky, particularly when new concepts are involved, and "every time you do something with computer-based training [CBT], you will be doing it for the first time," a management consultant warned here last week.

The introduction of any new program boils down to five phases: initial enthusiasm, disaster, search for the guilty, punishment of the innocent and praise and reward of nonparticipants, quipped consultant Gloria J. Gery, president of Gery Associates and vice-president of The Courseware Developers, Inc.

The road to successful implementation of CBT is paved not with good intentions, but rather with a clear grasp of the forces involved — pro and con — she advised participants at the Computer-Based Training Conference & Exposition. "All too often, people are pushed to get CBT and then punished because mistakes are made," she said.

Points to consider

Gery's presentation addressed a number of points that training managers should consider when selecting and implementing CBT systems. Successful implementation of CBT, she said, starts with gaining sponsorship within the organization. Sponsorship translates as financial support and is vital to the success of any program, yet often is taken for granted, she said.

To gain corporate support, managers need to motivate change. This is accomplished by assessing the current scope of training, figuring out what the options are and creating a vision of the desired state, she continued.

It is important to be realistic here, because many CBT vendors and consultants have succeeded in creating ridiculous expectations in users, Gery contended, and training managers risk loss of credibility when these hopes are dashed.

When selecting courseware, planners should realize that training is part of the package. "A well-designed [CBT] system doesn't need a training course," Gery claimed. Some of the risk in software selection and development can be alleviated if planners first educate themselves about the process involved.

CW photo by T. Keefe
Gery

CBT advocates want to be in a position to manage change systematically, creating a favorable imbalance between the driving forces for and against CBT, Gery said. Although there are many good reasons to use CBT, the pitfalls are also many, she added.

The foremost pitfall, she said, is the impact of technological advances. Although new technologies are expected to make the transition of CBT from conceptualized ideas to a viable reality, the speed with which these changes are occurring has created a measure of instability. Courseware companies are springing up all over, and standardization is still unsettled, she added.

There are many myths about CBT development that managers would do well to avoid, Gery advised. Among those myths, she noted, is the easy program change.

She warned that the more integrated the system, the more difficult it is to make the changes. Nor is distributing those changes digitally likely to be any less a nightmare than doing so manually, Gery maintained. Moreover, getting programming help to make those changes can be difficult.

"Sell MIS on the productivity gains resulting from your program; otherwise you could be bumped off the system or end up with unused courseware," Gery concluded.

DPMA group elects chief

PARK RIDGE, Ill. — Bruce E. Spiro has been elected 1984 president of the Data Processing Management Association (DPMA) Education Foundation. Formerly vice-president of the foundation, Spiro is chief of the Automatic Data Processing Equipment (ADPE) systems management office at the U.S. Defense Communications Operations Center.

Spiro joined the U.S. Defense Communications Agency in 1965 as head of the ADPE systems for communications control. The Defense Communications Agency provides development, engineering and management for the Defense Department's long-haul communications.

Elected to the foundation's board of regents were Dr. Joseph G. Dekan of the Department of Computer Science at the University of Texas in Austin; M. H. Schwartz, general manager of Software Quality Service, Bethesda, Md., and author of *The Electronic Cottage*; and H. Ray Souder of Northern Kentucky University's Department of Information Systems.

IEEE to offer videoconference

PISCATAWAY, N.J. — "Personal Computer Software — An Aid to Improved Professional Productivity" is the subject of a one-day videoconference that will be given via satellite to selected universities, companies and other locations throughout the U.S. on June 12. It will be broadcast via an interactive one-way video, two-way audio network by the Institute of Electrical and Electronic Engineers (IEEE).

The course will provide an overview of software tools currently available for personal computers to improve professional productivity. Topics to be covered include the role of an operating system, modern programming and design languages, data base systems in the engineering process, project management tools, graphics and electronic mail.

Emphasis of the course will be on the capabilities of applications software available for professional use rather than on specific technical applications, a spokesman said. Telephone hookups will allow participants to interact with the lecturers.

Further information on the videoconference is available from the IEEE Continuing Education Department, located at IEEE Service Center, 445 Hoes Lane, Piscataway, N.J. 08854.

Sperry DP study programs debut

PRINCETON, N.J. — Sperry Corp. Computer Systems Education has published a series of computer literacy self-study training programs for people interested in learning about the latest technologies.

Programs in the Sperry Computer Literacy series include "Introduction to Computers and Data Processing," $9.95; "Programming Theory and Design," $7.95; and "Number Systems," $4.95. Three other programs about Fortran, Pascal and Cobol languages are priced at $16.95 each. A program about the RPG-II language costs $19.95.

More information about the series is available from Sperry Computer Systems Education, P.O. Box 2191, Princeton, N.J. 08540.

Forum explores computing in campaigns

By James Connolly
CW Staff

WASHINGTON, D.C. — Data from drivers' licenses and magazine subscription lists, micro-to-mainframe links and laser printers let political candidates mold their campaigns and reach voters, according to speakers at a recent forum here.

Tobe

Computers in campaigns mean the ability to identify potential supporters from the 250,000 names in a congressional district, mass-mail personalized letters to those supporters and manage the business side of a campaign, said the speakers at the Annenberg Schools of Communications' Washington Program on Communications and Technologies.

"Almost all campaigns are aware that computers are affecting the campaign industry and realize that they are going to have to use them or see them used against them," said Frank Tobe, president of Below, Tobe and Associates, a Los Angeles firm that specializes in campaign software and campaign data services. Key uses for computers in elections are the identification of voters and support in reaching those voters "to change an opinion or to help the voter form an opinion."

Tobe told campaign workers, journalists and political scientists how technology can help a candidate. Using an IBM 3031-AP mainframe with 8M bytes of main memory, 4G bytes of disk memory, various tape drives and four printers — including a Xerox Corp. 9700 laser printer — Tobe's firm maintains data on 16.6 million voters in 38 states.

He and other consultants, including William P. McMillen of Connecticut and Edward Schneider of Detroit, explained how cross-matching the information in the public domain, such as voter registration and drivers' licenses, can be merged with commercially available lists, such as telephone directories and magazine subscription lists, to develop voter profiles by district, neighborhood and individual.

McMillen told the 75 forum attendees that 1980 independent presidential candidate John Anderson determined that some of his best supporters fit a particular mold. Using overlays, Anderson compiled lists of voters who were over 40 years old, drove foreign cars, read *The New Republic*, bought "high ticket merchandise" and lived in suburbia.

Schneider emphasized that such data bases must be built from various sources and that no single source provides a clear enough profile for candidates to make decisions.

Tobe said that in the 1984 election year, his company will produce 100 million pieces of mail, targeting not only voters, but also officeholders facing decisions on assorted issues. He told how laser printers can produce thousands of premarked absentee ballots with party slates checked off for voters in states that allow such balloting.

Such printers also have produced up to 2,160 mass-mailed constituent letters for each congressman, with each letter bearing a different voter's name, personalized letterhead and personalized type font. To distinguish the letters from other mass mailings, Tobe's firm asks voters to mail the letters in their own envelopes.

'Get out the vote'

The printers can also produce "get out the vote" messages, with the names of hard-to-elect candidates highlighted in their least secure voter neighborhoods.

Micro-to-mainframe links and communications among microcomputers also are becoming crucial for candidates, Tobe said. He reported that the Liberal Party in Canada is expected to use 90 or more IBM Personal Computers and compatible micros to allow campaigns of parliamentary candidates in different districts to share data in the upcoming elections there.

Tobe observed that today's voters are more "individualized" than their predecessors, and that campaigns must appeal to that individualism rather than relying on party loyalty. "If we know a person is a senior citizen, we can address that in the body of a letter. It may seem to be fleeting, but it isn't. We want to make that person pay just a little bit more attention to the message and hope [he] will remember the candidate's name favorably — or at least not unfavorably — and look for other things that the candidate has to say," Tobe said.

In some cases, he noted, candidates can include in data bases such details as whether a woman uses "Miss" or "Ms.," whether the person has ever met the candidate and the voter's likely ethnic background, based upon a dictionary of surnames.

When questioned by his audience about the ethics of directing a message to a single ethnic, economic or neighborhood group, Tobe emphasized that the concept of voter targeting is designed to inform voters of a candidate's stand on any of the several issues that concern the voter. The practice would be unethical, he said, only if the candidate sent "contradictory" messages to different voters.

According to Tobe, the value of computer-generated direct mail is particularly high in metropolitan areas such as Los Angeles, where it

Ever wish there were about five more of you?

Multiply programmer productivity with the Programming Environment (PE™) from Softool.

With PE you compose substantial portions of an application program from prefabricated code, and produce finished software that is fully checked out, documented and standardized!

Many PROVEN tools. PE is an integrated set of proven software tools that literally multiplies programmer effectiveness. It is like having another programming staff . . . on-line! Tools available include: structured languages, source code auditor, source code documenter, interface documenter, error detectors, libraries of prefabricated code, testing aids, tracing aids, optimizers, flow analyzers, conversion tools . . . and much more.

PE is interactive and friendly. It provides a consistent user interface, plus on-line tutorials.

PE supports both FORTRAN and COBOL.

Available now. Over 1000 Softool products are installed worldwide. PE is supported on the DEC VAX, DG MV, Gould S.E.L., Honeywell 6000 (Level 66 and DPS 8), HP 9000, and IBM 370, 30XX and 43XX computers.

There is more. PE is a stand-alone component of SOFTOOL®. A complete Change and Configuration Control Environment (CCC™) is also available.

If you are looking for true software productivity increases . . . and for management visibility, there is only one choice: SOFTOOL.

Call for more details or a hands-on demonstration.

Variety of sources seen critical to targeting voters

By James Connolly
CW Staff

WASHINGTON, D.C. — Drawing information from a variety of sources is the key to developing useful campaign data bases, a consultant told the Annenberg Schools of Communications' Washington Program on Communications Technologies and Politics here recently.

A computerized data base designed to target voters — to show a candidate which voters are friendly, or persuadable, and how to reach them — should utilize a combination of five sources, none of which can stand alone reliably, advised Edward J. Schneider, vice-president of Market Opinion Research of Detroit. The five sources are party organizations, previous election returns, political polls, census reports and lists such as telephone directories, magazine subscription lists and real estate tax rolls.

"What you need to do is to combine them so that the strengths of one lead into another," Schneider said. For example, party organizations and election returns might identify which voters are likely to vote and which voters need services such as rides to the polls. Meanwhile, census data can tell the candidate about a neighborhood's economic or educational makeup and give information about its home ownership pattern.

However, none of those sources tell the candidate what the voter is thinking, Schneider stressed.

'Clusters' advised

Schneider, whose company has done political work for individual candidates and for causes, advised the use of "clusters" to organize telephone or door-to-door surveys that can show what types of voters favor his firm's clients.

Those clusters can be built with the data drawn from the five key sources, Schneider said. A candidate might include in one cluster wealthy, well-educated suburban residents and in another cluster poor, uneducated urban residents.

He told how surveys will indicate, on percentage bases, which clusters favor the candidate, which are opposed and which rest in the middle, where they can be persuaded by either side in the campaign.

The data base, maintained on mainframes operated by companies such as his for major campaigns and used on microcomputers on the local level, can then be used again, he reported, to organize voter registration drives, fund raising, volunteer recruiting and "get out the vote" campaigns.

Those efforts are aided by the presence in the data bases of telephone numbers, ages, occupations and other information, Schneider noted.

Here's a hungry market for your computers

Libraries today are practically eating up computers and related products. There are 35,748 public, academic and business libraries in the U.S., with a voracious appetite for mainframe, micro and minicomputers, and for accessories and software.

Reaching the people with the power to put your computers and related products in their libraries can translate into big sales. The way to reach those decision makers is in the pages of LIBRARY JOURNAL.

LIBRARY JOURNAL is the leading magazine for news and developments in the library world, and for information and advice on the roaring growth of computer applications in libraries. It is the only full-service publication in its field, where you can effectively target your message to the influential buyers in public, college and university, and business libraries.

If you'd like to put your computers and related products on the menu of America's hungry libraries, check out LIBRARY JOURNAL. Return the attached coupon today.

Hammer to talk at Federal Expo

WASHINGTON, D.C. — The former director of computer sciences for Sperry Corp., Dr. Carl Hammer, will deliver the keynote address at the 10th Federal DP Expo and Conference April 17-19 at the Washington Convention Center here. The topic of his address will be "Here Come the Micros: The Federal Future."

Hammer, president of Research Consulting Services in Washington, also served as manager of scientific computer applications for RCA Corp. He is a fellow of the American Association for the Advancement of Science. In addition to his address, he will present the first annual Hammer Award for the best conference paper.

Federal DP Expo will feature a 47-session conference highlighting the integration of desktop computers into the federal government's mainframe-based environment.

Registration for the conference for government employees is $95 for the full program or $40 for one day. Registration for all others is $125 for the full conference and $55 for one day. Government employees may attend the exhibits for free; all others must pay $10.

A discount registration fee for groups of five or more is also offered. More information about the conference can be obtained from The Interface Group, 300 First Ave., Needham, Mass. 02194.

MAIL from page 17

may be the only contact a candidate has with most voters. That may occur because a metropolitan area may have 20 or more congressional seats and dozens of candidates vying for news media exposure.

Tobe said that managing a campaign by computer has become more crucial, since the number of campaign workers has dropped, while the cost of campaigns has increased. Such management can involve organizing volunteers according to what tasks they can do and when, candidate scheduling, financial accounting, budgeting, word processing and operating telephone banks.

GOP seen years ahead of Democrats in computer use

By James Connolly
CW Staff

WASHINGTON, D.C. — The Republican Party, with a shortage of registered voters, is "10 years ahead" of the Democratic Party in building computerized national data bases for election campaigns.

However, Democrats at the grass roots level are more quickly recognizing the value of microcomputers than are their GOP opponents.

Those observations were offered by a Connecticut political and computer consultant who spoke here earlier this month at the Annenberg Schools of Communications' Washington Program on Communications Technology and Politics.

"The Republican Party is 10 years ahead of the Democratic Party as far as using computer technology, at least with major systems and major data bases," said William P. McMillen, chairman and founder of Word Communications Systems, Inc. of Ellington, Conn. Addressing 75 campaign workers, journalists and political scientists, McMillen added that Republicans have tended to centralize their party by using mainframes at national headquarters and sending relevant data to local candidates.

In contrast, Democrats have been less likely to centralize their data, according to McMillen. Instead, they have leaned toward smaller, microcomputer- and minicomputer-based systems for campaigns ranging from municipal elections to congressional races. McMillen reasoned that a growing number of Democratic campaign workers, particularly at the local level, have been young, college-educated and computer-literate.

The systems that McMillen referred to are used in 10% to 15% of all campaigns and in almost all races for congressional seats, he reported. "Overall, it is still a comparatively low percentage of campaigns that are using computers regularly. What is happening, however, is that you talk to a campaign and they say that Uncle Joe has a computer and that they are going to try some things on that. Of course, like everything else, as the prices keep going down, there are going to be a lot more computers out there."

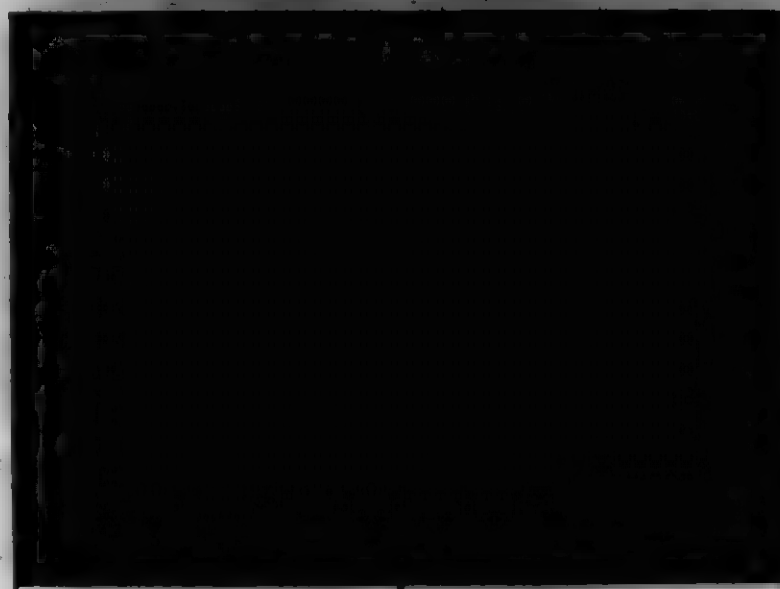
McMillen, whose firm produces Politech I software for IBM Personal Computer XTs and the Candidate Information System for the IBM System/34 and 38, contracts with candidates to compile data bases in various elections.

The systems are intended to let the candidate target and reach potentially favorable voters, contributors, volunteers and news media; help the campaign save time and money by steering away from clearly hostile voters; and help manage the campaign as an organization. Management modules perform tasks such as strategy planning, volunteer organization, scheduling, budgeting, accounting and financial reporting.

McMillen said computers are used often for word processing and generating mail. Those uses include general clerical work and direct mail — often personalized for the voter — in connection with letter writing and speech writing, many campaigns are now using their computers to tie into commercial data bases such as those offered by United Press International and The Associated Press to aid in research.

McMillen observed that campaigns haven't been at the forefront in developing or accepting computer technology. "Campaigns are still backwards. These programs that we're talking about aren't magic. They've been developed for business for 10 years. You also won't see campaigns innovating, because they're here today and gone tomorrow. What you will see are things being developed for business, and we will mimic them."

RAMIS II MAKES YOUR INFORMATION CENTER A GREAT PLACE FOR PEOPLE.



RAMIS II's complete solution is the most effective way to multiply the productivity and satisfaction of your end users and your Information Center staff. Today, RAMIS II means success at hundreds of Information Centers around the world.

POWER AND SIMPLICITY FOR END USERS

RAMIS II provides everything users need for maximum productivity. Its powerful report writer, relational database and language, full-color business graphics, SAS® interface, and many other capabilities meet the most advanced decision support needs. And, with our new RAMLink, IT series, and RAMIS II/PC software, end users have the ideal solution for mainframes and personal computers.

RAMIS II English comprehension extends the power of your Information Center to a multitude of new computer users. Through advanced knowledge-based technology, even people who've never been on speaking terms with a computer can ask questions, obtain answers, and create reports in only a few minutes using everyday English.

EFFICIENCY AND RELIABILITY FOR SUPPORT STAFF

Our complete solution lets your existing staff support many more users by dramatically reducing the number of products you need. And RAMIS II makes your support job easier with built-in computer-based training plus facilities to monitor and control usage.

RAMIS II delivers the performance and reliability needed to tackle even the largest decision support tasks with confidence. In fact, because RAMIS II is also a complete application development system, single-user systems can evolve smoothly into full-fledged applications.

SAS® is a registered trademark of SAS Institute, Inc.

First Chicago is launching a whole world of new banking services with ***Tandem NonStop Computer Systems.***"

At The First National Bank of Chicago, providing responsive on-line financial services for our customers is a common corporate priority. An important part of that commitment is the global implementation of core applications on Tandem NonStop Computer Systems.

Utilizing a common data base structure on systems distributed throughout the world provides immediately useable information uniquely suited to internal reporting and accounting. Included are such time-sensitive items as foreign exchange trading, money market transactions, loan contracts and SWIFT transfers. We call this system F I R S T, First Chicago International Real-time System for Transaction.

Tandem systems also support our installed and expanding consumer and commercial funds transfer, balance reporting, and cash management systems, which move billions of dollars for our customers daily. Our Cash Station ATM switch is an excellent example. The modular nature of the Tandem solution enables us to sustain and improve quality by adding such capabilities incrementally, where and when they're needed.

Our Tandem systems are proving reliable. We look forward to being impressed with the systems that support us, with our employees, with our customers. Their enthusiastic acceptance of Tandem systems is helping us improve customer service.

The NonStop System.

The only computer on the market today that can support an integrated network of up to 255 16-processor systems supporting thousands of terminals in a worldwide, distributed, transaction-based environment.

Tandem. Fully supported by worldwide sales, training, service and manufacturing organization.

For more information on the Tandem application at First Chicago and a copy of our brochure, "Solutions in Banking," contact your local sales office or Tandem Computers Incorporated, 19333 Vallco Parkway, Cupertino, California 95014, U.S.A. Toll Free 800-482-6336.

NonStop Transaction Processing

Navigate through performance problems with EPILOG™/MVS

Before EPILOG/MVS, performance problems were often hidden in piles of printouts and pages of reports.

With EPILOG/MVS, you can find the answers to your questions about…user response… service levels…capacity management… and more.

The problems of wading through masses of data are now solved by a breakthrough in EPILOG/MVS. It's called the System Performance Navigator. With it you visually identify a problem area on the CRT (example, Figure 1: long response time of 1.81 seconds on Tuesday, July 5). Then you simply put a command character (e.g., "D" for degradation or "R" for resource utilization) on the problem line (marked by the arrow). The System Performance Navigator will immediately generate the next display customized to the specific problem area.

EPILOG/MVS guides you from problem to solution in as little as three easy steps. The System Performance Navigator allows you to navigate: from weekly summary information to hourly details, from service levels to degradation analysis, and from degradation analysis to resource analysis.

EPILOG/MVS: Simple to use—but powerful!

For more information, contact your Candle representative.

!Candle®
10680 Wilshire Boulevard., Suite 2404
Los Angeles, California 90024
(213)207-1400

Figure 1—*User notes long response time for July 5, and enters "D" to generate degradation display in figure 2, at the arrow.*

Figure 2—*User observes that Private Page-In Wait is a problem and enters "R" to generate page dataset activity display in figure 3, at the arrow.*

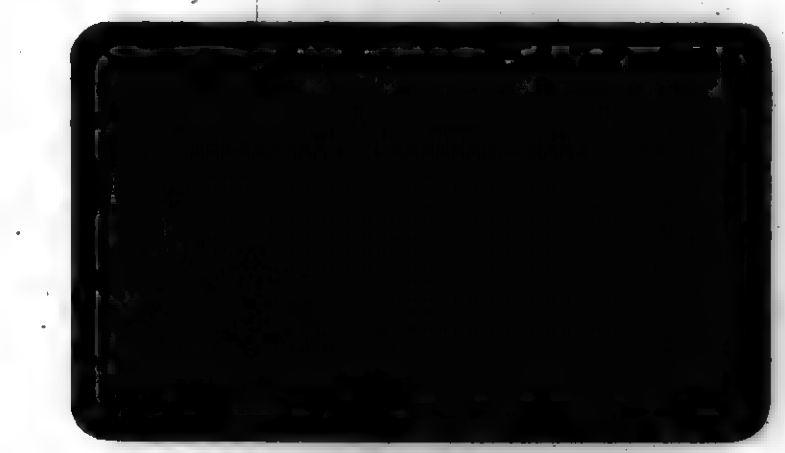

Figure 3—*For detailed analysis of the paging resource, EPILOG/MVS shows statistics on both the page datasets and the DASD devices they reside on. This screen shows the cause of the problem: device contention causing very high busy rates on devices 150-152 which contain the local page datasets.*

INTERNATIONAL REPORT
CW International News Network

AUSTRALIA

BRISBANE — An intelligent software editor that is said to prevent compilation errors is under development here at ICL, Inc. The first working system is due for delivery within the year, a spokesman said. The front-end editor will be based on ICL's Perq Professional workstation, which features graphics capabilities in addition to processing and storage power. It reportedly will perform compilation checking at the program input stage, carrying out syntax and semantic checks.

■

SYDNEY — The Net/Master network management and control software from Software Developments Pty. Ltd. will be distributed on a worldwide basis by Cincom Systems, Inc. Under the terms of a recent marketing agreement, the two companies will receive royalties on each package or component of Net/Master sold.

■

MELBOURNE — The Broken Hill Proprietary Co. Ltd. has ordered 21 SAS Software Pty. Ltd. data management packages for its Data General Corp. MV series minicomputers, even though some of the software products have not been fully converted to run on DG equipment. The order is valued at approximately $80,000.

FRANCE

PARIS — IBM dropped prices here and elsewhere on its Personal Computers. In Paris, prices fell 18% on the diskette version of the Personal Computer and 6% on the Personal Computer XT. In Stuttgart, West Germany, IBM GmbH slashed prices by about 20% on the basic Personal Computer and 10% on the XT; in Stockholm, IBM Sweden cut prices by 20% on the Personal Computer and 8% on the XT.

■

CANNES — A series of computers and office automation systems for the European market was unveiled here recently by Northern Telecom, Inc. Called the Vienna Family, the series reportedly combines a fully compatible range of hardware, international communications standards and widely used operating systems and languages. The system is based on Intel Corp. microprocessors and a twin Microsoft, Inc. MS-DOS/Xenix operating system.

JAPAN

TOKYO — Meiji Mutual Life Insurance Co. and Toshiba Corp. will jointly develop a large-scale document managing system incorporating Toshiba's optical disk file device, Toshiba 3200 and a local-area network.

■

TOKYO — The Ministry of Labor has released a report that lists a number of guidelines for the protection of VDT operators. The report is the result of a year-long study conducted by the Ministry and consists of three parts: working environments, working conditions and health management practices. One of the many recommendations made by the Ministry is that VDT operators should take a 10- to 15-minute break after every hour worked on the VDT.

■

TOKYO — Nippon Steel, which claims to be the world's largest steel manufacturer, will establish a computer network composed of several different types of systems scattered around Japan. The first step in the planned network was the formation of a data base for the Ironworks Operation Analyzing System at Nippon's Tokyo headquarters, which can reportedly be accessed by each of the company's ironworks sites.

NETHERLANDS

AMSTERDAM — Apparently IBM's antitrust days are still not over: The case between Big Blue and the European Economic Commission (EEC) is still making news here. Two of the four original complaints — concerning interface information and the bundling of a CPU with a certain amount of memory — still stand. The other two complaints — the bundling of system software with the CPU and the system installation productivity options — were dropped last year. Dutch Commissioner Frans Andriessen will render a decision on the case.

■

AMSTERDAM — The University of Nijmegen will be Holland's first user of Lisp Machine, Inc.'s Symbolics 3600 system. In all of Europe, there are only 25 Lisp systems installed, according to a spokesman.

SWEDEN

STOCKHOLM — The Swedish white-collar workers' union, known as TCO, will offer free computer education to its 46,000 members. The TCO initiative was taken in part to close the widening gap between older office workers and younger workers, who were taught computer science in school.

■

STOCKHOLM — The Swedish electronic firm Siemens-Elema has unveiled a pacemaker that can reportedly be programmed by radio signals from the outside without removing the surgically implanted device from the patient's body.

The firm is now in the process of developing a pacemaker that can reprogram itself by responding to a patient's own biological signals.

WEST GERMANY

MUNICH — While microcomputers are making their way into large companies in the U.S., this is not the case in West Germany. Analysts theorize that data processing managers in big companies firmly believe in the centralized DP concept and have a tendency to block the "micro invasion," fearing a loss of their status in the company.

■

MUNICH — Digital Equipment Corp. here has announced the MicroVAX I and the VAX-11/725 series, which is composed of six different models, for German offices. Pricing for a basic configuration starts at approximately $50,000.

Scribe supports laser printers

You've heard a lot about laser printers . . . high print quality, attractive fonts, fast, quiet, affordable. But you haven't heard a lot about software to support them.

The Scribe Document Production System supports more laser printers than any other software. Laser printers like the Xerox 2700, 8700, 9700, the IMAGEN IMPRINT-10™, the Symbolics™ LGP-1, the DEC LN03 Laserwriter, and soon the IBM 6670.

Buying a laser printer? No matter which one you choose, you'll get the most from it with Scribe.

For more information, contact:
UNILOGIC, Ltd.
190 North Craig Street
Pittsburgh, PA 15213

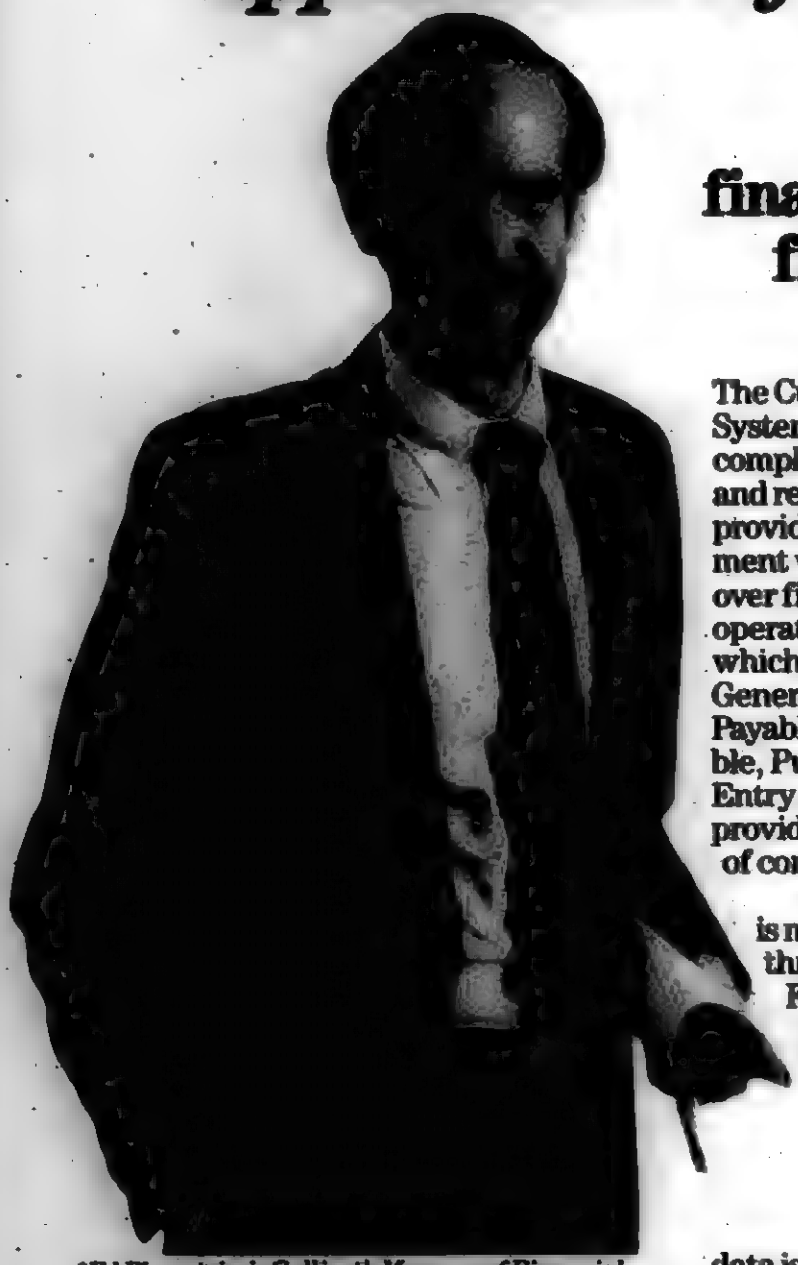
"The Cullinet Financial System is a major advance in application software technology."

—Ed Blumstein*



Because it is the first financial system designed for both financial and data processing professionals.

The Cullinet Financial System is a functionally complete online accounting and reporting system that provides financial management with extensive control over financial planning and operations. The system, which includes the modules: General Ledger, Accounts Payable, Accounts Receivable, Purchasing, Order Entry and Fixed Assets, provides a new level of control.

This level of control is made possible through the Cullinet Financial System's horizontal and vertical integration with Cullinet's Database Software.

Horizontal integration means that all financial data is controlled and accessed directly from Cullinet's IDMS/R database management system. So, for example, a single vendor record is available to Purchasing and Accounts Payable, whether cutting a purchase order or writing a check. Thus, you are assured that the vendor information is consistent throughout all systems. The Financial System is also integrated with Cullinet's Manufacturing System in the same way.

Vertical integration means that the financial system is designed and developed using IDMS/R and ADS/OnLine, Cullinet's fourth generation programming productivity tool. This unique architecture provides data processing with the means to tailor and modify the system. Since you don't want to change your business to match the functions of the software package, Cullinet provides the tools to tailor the software to meet your business requirements.

The combination of horizontal and vertical integration means, for the first time, a financial system is available that meets the requirements of both data processing and financial management.

Attend an informative seminar explaining this integrated financial system. To participate in one of the 700 Cullinet seminars scheduled internationally, send in the coupon or call 1-800-225-9930. In MA, 617-329-7700.

Fingerprint ID system quick to solve criminal cases

By Robert Batt
CW West Coast Bureau

SAN FRANCISCO — A computerized fingerprint identification system recently installed at this city's police department yielded surprising results just one week after going on-line this month.

The $2.6 million Automated Fingerprint Identification System (Afis), manufactured by NEC Corp., has already resulted in an arrest for a previously unsolved six-year-old murder case and the identification of 40 other criminal suspects.

Announcing the system at a press conference on March 2, San Francisco Police Chief Cornelius Murphy said, "This system represents the most dramatic investigative tool introduced in the history of this city's program to equip our law enforcement officials with the tools they need to apprehend criminals quickly and effectively."

Up until this time, only Japanese police had access to Afis. Soon, however, a similar system is to be installed for state police in Alaska, and more systems, elsewhere in the nation, are expected to follow.

Removes file searching

The system is intended to remove the labor- and time-intensive fingerprint file search process. It enables local police officials to check fingerprints taken at the scene of a crime with those of known criminals on file at a rate of 650 prints per second. A trained fingerprint specialist then verifies the match and subsequently provides expert testimony that is required in a court of law.

Last week, according to the San Francisco Police Department (SFPD), computer technicians and city workers completed the electronic transfer of some three million fingerprints, accumulated over 40 years, from city hard-copy files to the new system's data bank.

Consisting of a scanning device and a reader with three components — a controller, a scanner and a processor, the Afis system converts the scanned information into binary data, which is transferred to a graphics display device called a Fingerprint Input Monitor, where forensic experts are able to enhance the print image.

The scanning process takes place on a NEC mainframe, and the data files consist of twin drives capable of storing up to 1.27G bytes of information. Prints which match up with those already stored in the data base are called up on three on-line terminals.

One of the areas where Afis is expected to reap particularly favorable results is in searching the data bank for possible matches against partial or "latent" prints taken from the scene of a crime.

According to the SFPD, partial prints — some no larger than a dime — have historically been very difficult to process manually against full-fingerprint file copies.

In the past, police officials stated, a manual search could take months, as detectives attempted to match a fingerprint taken from the scene of a crime against one in the city's files, often without success. The new system, they claimed, can complete a thorough search for a match in less than an hour in almost all cases. And for the majority of cases, search time is an estimated five minutes, they maintained.

Using a microfiche retrieval system controlled by NEC's Advanced Personal Computer and extensive new algorithms, company officials claimed the prints can be graphed, plotted, clarified, enlarged and quickly scanned to match against fingerprints in the data bank files. A NEC Spinwriter printer is used to print out the results of the matched prints.

"In one week, we have

CASE #4
SOFTWARE SURVIVAL

Aaahh. The headaches of developing software. Your projects are too late. Too expensive. And frankly, don't always meet user needs.

So you look for help. You turn to software development aids. But instead of getting peace of mind, all you get are piecemeal solutions. Not so with Nastec.

NASTEC CASE 2000™ products provide computer aided development and a managed life cycle approach that fit well with your existing methods. You'll have more control over your software development process, which means higher quality software. On time. On budget.

So now you have a choice. You can take two aspirins. Or you can call Nastec in the morning.

Call toll-free 1-800-872-8296 (in Michigan 313-353-3300). Or write Nastec Corporation, 24681 Northwestern Highway, Southfield, MI 48075, for more information about our NASTEC CASE 2000™ Workstation and Software Products. Our software survival solution is just what the doctor ordered.

We don't promise.
We deliver.

DP managers urged to police micro purchase, not use

By Paul Somerson
CW Staff

NEW YORK — DP managers should set a policy for purchasing microcomputers and then allow users to determine how the machines will be used.

Users, data processing managers and industry analysts delivered that message at a conference on "Microcomputers: High Performance/High Payoff," which was held here earlier this month by Micro Mainframe, Inc. of Cambridge, Mass., and Morris Decision Systems, Inc., based here.

"The data processing manager's function is to determine a policy, not implement a plan," said Peter Berg, chairman of Micro Mainframe. "There is an important distinction between a policy and a plan. A policy establishes the rules of the game: The company will work this way. It incorporates accountability and involves complex planning. It should not be done by a chief executive, but by the MIS manager."

A policy should limit brands of hardware and software so the company is not saddled with numerous incompatible systems. But each user should determine the benefits of a given package. "If a user has been using a Cobol generator and likes it, then he should be allowed to continue to use it," said Dr. G. M. Hughes, vice-president at Pfizer, Inc., a pharmaceutical company here.

Allowing this flexibility will require a change in DP managers' thinking. "Data processing managers must recognize and respect the reality of ambiguity in a decentralized policy," Berg said.

"That requires a new style of delegation. The data processing department should license hardware and software to the user. Once he has the license, he should be able to drive wherever he wants, within limits. It is the auditor's role, not the data processing manager's, to police the drivers," according to Berg.

Berg predicted significant changes in software. "[Lotus Development Corp.'s] Symphony is the last significant product of this generation of software," he said. "We are witnessing the end of the [Visicorp] Visicalc era. Shortly, software will be written for new hardware with 1M-byte random-access memory, bit mapping, data base management and downloading features."

While software will become more powerful in the next few years, Anthony P. Morris, president of Morris Decision, a microcomputer sales and consulting firm, thinks that the user interface will remain constant.

"Once a user becomes accustomed to working with a piece of software, it is very difficult for him to switch to another package, no matter how powerful it is," Morris claimed.

AFIS from page 25

done the equivalent of six months' work. We have so far identified 40 criminal suspects just from the fingerprints, when our usual total is 60 per year," commented inspector Ken Moses of the SFPD. Moses said the system was expected to help not only with crime detection, but also with crime prevention by leading to the capture of criminals such as burglars and rapists who are apt to commit a crime more than once.

"When fingerprints are involved as evidence, there is traditionally a conviction rate of 98%, since there is very little defense against a fingerprint," he added.

In addition to "scene-of-the-crime prints," under the new system anyone arrested and booked on a felony will automatically have his fingerprints entered into the data bank. Afis, in turn, will perform an automatic check to determine if the prints have been filed previously.

Our graphics you to your

ISSCO graphics software supports more than 200 output devices from nearly 50 manufacturers.

That's right. Over 200 different terminals, plotters, printers and film recorders. And the number keeps growing as important new ones are introduced.

Only ISSCO lets you choose from such a wide range. You can mix and match computers and output devices for the best fit. And you'll protect your software investment from becoming obsolete when new items appear.

What's more, ISSCO gives you Layout Intelligence that automatically formats your graphics to fit the device used. Plus Device Intelligence that automatically takes advantage of each device's special features.

But device freedom isn't all. ISSCO software also works with many different mainframe and 32-bit minicomputers from Apollo, Burroughs, CDC, Cray, DEC, Honeywell, HP, IBM, Perkin-Elmer, Prime and Sperry.

Once you've seen ISSCO software in action, you won't want to use anything else.

TELL-A-GRAF® MAKES QUALITY GRAPHICS EASY.

ISSCO's TELL-A-GRAF software allows users to quickly make professional-quality charts and graphs themselves. Since it uses conventional English commands, it's easy to learn. In no time you'll be making beautiful line, bar, pie and word charts. Adding CUECHART™ lets completely untrained people generate high-quality TELL-A-GRAF plots.

Bank executives warned of dangers of electronic fraud

By James Connolly
CW Staff

WASHINGTON, D.C. — "When dealing with computer security, you have to remember that computer-related crime is a people problem."

So said Anthony J. Adamsky Jr., chief of the Federal Bureau of Investigation's Financial Crimes Unit, who addressed the Bank Administration Institute Bank Security Conference and Exposition here earlier this month.

Along with John R. Simpson, director of the Secret Service, Adamsky warned bank security officials of the dangers of computer crime and outlined some steps the federal government is taking to solve and prevent such crimes.

Adamsky encouraged the bankers to "hire good people" in their computer and wire-transfer rooms and to maintain tight audit procedures. He also stressed establishing a good rapport with employees, which allows management to identify early signs of worker stress and financial problems that could lead an employee to steal. He told the bankers to set up disciplinary policies that will deter crime.

"Basically, it is the person who has authorization to work with the computer who is involved in computer crime," Adamsky said. It is the hacker mentality — the compulsion to access what they shouldn't — that leads some data processing personnel to access computers illegally. Those personnel, he maintained, should be weeded out of the company.

Adamsky told the bankers that the next several years will witness lawyers haggling over several questions of computer law, such as a definition of trespassing as it applies to data bases and of stolen goods as applied to software.

Adamsky couldn't estimate the extent of computer-related bank crime, noting that the potential is "enormous" and adding that many bank losses aren't reported. But Simpson noted later that the number of electronic funds transfer (EFT) cases reported to the Secret Service has increased rapidly in the 17 months since the agency received authority to investigate EFT fraud. In one six-month period, the Secret Service received 1,415 EFT fraud referrals.

"We can only expect the spiral to continue as the government converts more and more to electronic transfers," he said.

Simpson noted that the Secret Service investigates only cases involving U.S. Treasury Department funds, such as pension checks. "Luckily, at this point, these fraud cases have involved relatively small dollar amounts," he said.

They are typically "deceased payee" cases, where survivors continue cashing a dead person's checks, costing the government $200 to $45,000.

However, criminals are increasingly finding fraudulent ways to have the government electronically deposit checks into accounts that the criminals can access through automatic teller machines.

Simpson pointed out another criminal threat of potentially huge proportions — the manipulation of software in any one of a number of federal agencies to siphon off some of the $600 billion the government collects and the $900 billion the various agencies pay out each year.

Simpson warned, further, that the proliferation of personal computers could threaten the $30 billion that U.S. corporations transfer by wire each day.

One of the Secret Service's strategies to combat EFT fraud, Simpson said, is preliminary investigation of EFT fraud cases, even if they prove too small to pursue, because agents can learn more about the criminals' tactics and the victimized organization's weaknesses.

software leaves own devices.

THE DATA CONNECTION™ GETS ALL THE DATA.

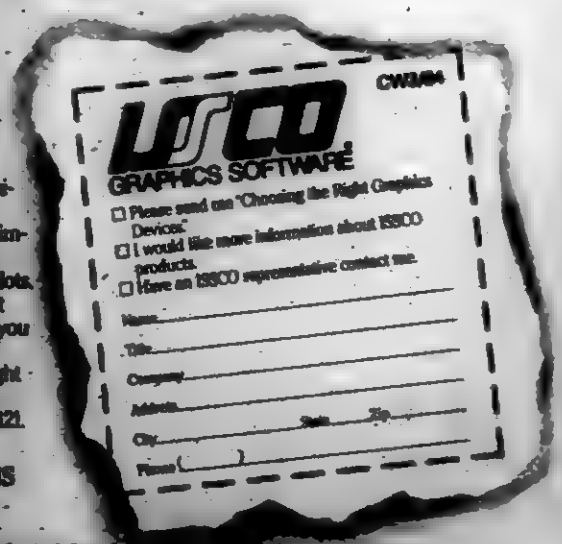
By combining TELL-A-GRAF and THE DATA CONNECTION, users can access data directly from their computers for conversion to graphics. THE DATA CONNECTION can summarize, tabulate, edit and perform mathematical manipulation to put data into the best form for graphing.

DISSPLA® CAN DO IT ALL.

With DISSPLA software, almost anything is possible. This high-powered product is a library of over 400 subroutines that facilitate data plotting. Business and scientific programmers use DISSPLA to produce everything from simple pie, bar and line charts to sophisticated 3-D diagrams, maps and contour plots.

Shouldn't you be using software that gives you great graphics, but still leaves you to your own devices? For a free copy of our 40-page manual, "Choosing the Right Graphics Devices," write ISSCO, 10505 Sorrento Valley Road, San Diego, CA 92121. Or call (619) 452-0170.

DRAW FASTER CONCLUSIONS WITH ISSCO.



High school hacker to undergo counseling

By David Gleason
CW Staff

LITTLE ROCK, Ark. — A 15-year-old high school student who admitted he tapped into the district's computer system to change his grades will undergo counseling at a mental health clinic for the remainder of the school year.

The unidentified sophomore told school officials that he gained access to student files stored in the district's Honeywell, Inc. DPS 8/44 mainframe and raised his grades and those of one other student, according to Bobby Lester, assistant superintendent for the Pulaski County Special School District. The student used a telephone and a Victor Technologies, Inc. VIC 20 home computer to break into the system late at night, Lester said.

The break-ins were discovered last December after school officials noticed that some grades had been changed. The computer's telephone access number was changed, and a tap was placed on the line.

During a two-week period in January and February, the student made six unsuccessful attempts to enter the system. The calls were traced to his home telephone number, Lester said.

"We approached him with this [information], and he admitted his guilt," Lester said. No criminal charges will be filed.

Although the student was not enrolled in any computer classes, Lester said, he had shown an interest in how the district's computers worked. "He doesn't get good grades in school, but he's a very bright student."

Before discovery of the break-in, the student had sent an anonymous letter to the director of the computer center in which he described how the system could be entered.

Under district policy, students found guilty of gaining unauthorized access to the computer are given two options: expulsion or placement in the Fullerton Adolescent Center, a state-run mental health clinic. The policy was established last December after two previous computer break-ins.

In one of those instances, a student created a fictitious course schedule for Mickey Mouse. In another, a student gained access to personnel records containing teacher salary data, Lester said.

As a result of the latest episode, the district has tightened security on its system. Junior high and high school students who use the district's more than 200 terminals are no longer given the codes that allow them to access the system — teachers now have to key in the codes themselves.

"You'd like to operate on an honor system," Lester said, "but you can't do it in a situation like this."

Software institute changes name

SUNNYVALE, Calif. — The Institute for Software Engineering has changed its name to the Institute for Information Management. A division of Boole & Babbage, Inc., the institute provides educational, publishing, research and consulting services to information management clients.

The name change was made, according to the institute's assistant general manager, Dr. Leilani Allen, "primarily because the whole thrust of our efforts has increasingly become oriented toward information as a resource, information as an asset." Allen added that the institute has come to focus as much on hardware and management issues as on software.

The institute publishes the *Journal of Capacity Management* and *Information Executive: The Journal of Information Economics* and operates a graduate degree program in information management.

Modeling tool tightens manufacturer's cash-flow control

GLENVIEW, Ill. — A worldwide manufacturing firm here improved its long-range planning and tightened its control over cash flow when it augmented an in-house reporting system with a financial modeling and analysis package.

Signode Industries, Inc. is a leading manufacturer and distributor of strapping systems for use in packaging and materials handling. A $700 million company, Signode manufactures a wide variety of products sold in over 100 countries in such diverse fields as forest products, steel, printing and food. The company employs some 6,000 people and has 35 manufacturing locations in Europe, Asia and South and North America.

Signode's data processing department recently developed a managerial reporting system that runs under IBM's MVS operating system on an Amdahl Corp. 580 Model 5860 mainframe. Known as the Executive Information System (EIS), the reporting system is comprised of both internal operational data and external economic and competitive information. It displays data, reports and graphs on IBM 3279 color terminals operated by light pens.

To improve the range of its financial planning capabilities, Signode sought a software system for modeling and "what-if" analysis. "We looked at three outside packages and also considered developing the financial modeling system in-house," Birgis Uskup, vice-president of computer services, explained. "We made up a test problem with our own data, and we put all the packages through their paces. We had almost 24 separate criteria — each assigned a different weight — that we used to judge each package."

Costly in-house effort

Uskup estimated that to develop the software in-house would have cost five or six times as much as the outside system Signode eventually selected — the System W modeling and analysis package from Comshare, Inc. System W, he said, works in conjunction with EIS through the MVS operating system.

"With System W, we can do the types of financial analysis we need in a timely fashion and at less cost. With our programming capabilities, we could have delivered the kinds of answers System W generates, but we couldn't have done it on a timely basis."

Uskup said that System W has given Signode's managers financial modeling capabilities that help them manage the firm's large debt position on a short-term and long-term basis.

"Because of the nature of this business," Uskup said, "our debt position and our cash flow are extremely important, and the timeliness of that information is critical. System W allows us to monitor our cash position very carefully on a daily basis. It has also helped our planning by identifying for executives the factors behind key indicators such as cash flow, earnings or growth. That has sharpened our understanding and allowed us to put appropriate emphasis on the right areas."

After Signode acquired System W, the financial planning department worked with Uskup's staff to develop a one-year planning and budgeting system. "Once those reports were automated on System W, they could be done in a matter of hours, and I gained three man-months for my staff," said Frank Presocky, assistant controller for financial planning.

Uskup said System W will be an "information center offering" in the future. Signode is currently installing an IBM Model 3083 mainframe that will be devoted entirely to end-user computing, he said, including financial modeling and analysis with System W.

POWERFUL

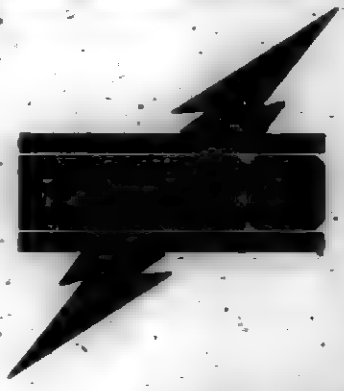
HERO SAVES IBM!

Incredible as it seems, even Big Blue needs to be bailed out now and then. Personal computers are such a runaway success, they're running Information Managers ragged. The problem is personal computers and mainframes don't always work together.

The result is Computer Shock. And nothing short of a HERO™ can cure it.

HEROISM COMES TO PERSONAL COMPUTING.

HERO is the intelligent, desktop Networked Personal Computer from MDS®. It does everything a personal computer can do. And lots that it can't. But HERO's main fame derives from its interaction with the mainframe.



INTELLIGENCE AT EVERY STATION.

Mated with the MDS SUPER 21™ Communications Processor, HERO can converse intelligently in IBM networks. HERO emulates IBM 3270 SNA and the 3776 remote-job-entry systems. Our SUPER SNA™ option gives you both on one communications link. HERO runs software under MS-DOS. Plus its own multitasking operating system.

HEROS UNITE AND CONQUER.

With MDS HERO and SUPER 21, you can access private, departmental and corporate databases. Instead of not working, your entire organization can be networking. Under your control.

And only MDS offers you INTELLIGENT 3270.™ So you can write your own programs and integrate them with data in the mainframe. HERO lets you retrieve information from the database, process it, display it and update it. Then either return it or store it locally.

EVEN HEROS NEED ALLIES.

In addition to HEROS, SUPER 21 is available with non-intelligent workstations within INTELLIGENT 3270 networks. MDS offer the PLUS 80™ family of plug-compatible controllers, printers and displays. They're directly interchangeable with corresponding IBM 3270 units.

MDS HERO MAKES A HERO OUT OF YOU.

With HERO and SUPER 21, your existing data processing investments become part of an ever-expanding fund of available data. All of it coordinated, cost-efficient and controllable.

MDS systems are planned for non-obsolescence. They're modular in design to accommodate future growth. So every MDS system, like a hero, is immortal.

GET THE ADVANTAGES OF BIG WITHOUT BEING BLUE.

MDS is a multidivisional, multinational corporation. We've grown by helping our customers to grow. By focusing our size and scope on responsiveness to their needs. Not just in IBM country, but beyond.

We can do the same for you, wherever you are.

MDS offers service and support capability around the world, around the clock.

Ask our customers about us. And give us a call. Dial **800-MDS-HERO.** We'll show you how, when it comes to networking, MDS can help you unite and conquer.

MDS MOHAWK DATA SCIENCES

NEWS

TURNAROUND TIME
Larry Long

Q We were informed about three months ago that our division would be merged with a recently acquired division and that both would be moved to the Southwest during the last quarter of 1984. Some employees will be asked to transfer, but their names have not been announced.

I am the director of a small computer center that may or may not exist after the move. I'm willing to make the move, but my manager continues to say that it is too early to determine who will be transferred and who will join the unemployed. How can I encourage him to make these important decisions so that we can make plans?

A I would not even try. Your boss is either inconsiderate or using you, and I suspect the latter. I would suggest that you update your resume, and seek employment elsewhere.

Q Until a few months ago, I worked for five years in a dead-end position editing technical manuals. I transferred to a more challenging position with a newly formed documentation group in the management information systems department. The job is definitely challenging, but nobody told me about the frustration.

There are three of us in the group, and none of us has a computer background. Our jobs, as they were described to us, would entail the writing of user systems manuals and, perhaps somewhere down the road, some user education manuals. We were to take the system write-ups provided to us by programmers and analysts and write "user-friendly" manuals.

The three of us are part of the systems and programming section, and everybody seems to think that our function is to document their programs, as well as write the user systems manuals.

Programmers literally dump program listings on us. Then they ask us to prepare flowcharts and document program listings. When we approached our boss and told him that we didn't feel qualified enough to do this kind of documentation, he told us to learn.

Do documentation specialists in other companies document programs?

A Documentalists involved in program documentation would normally clean up completed but rough documentation that is provided by programmers. It is extremely inefficient to ask someone not involved with designing the logic and writing the code of a program to document it. First of all, documentation is a by-product of the development process, not something that is done hurriedly after a program is running. Second, the original programmer is in a much better position to produce documentation than you.

Documentation is viewed by many as an unpleasant task that is either done haphazardly or, if possible, avoided. To these people, the establishment of your group meant no more documentation.

A well-written program is usually accompanied by good, but not necessarily clean, documentation. If your job description continues to include program documentation, then it should be a clean-up operation.

Programmers should be given minimum documentation standards that must be met before programs are submitted to you for final documentation.

Q A recent career change took me back to college to study programming and information services. In a previous incarnation, I worked in sales and marketing. The reason I chose the computer field was the potential for jobs and career fulfillment.

At this point, neither seems attainable. I have made myself available for any type of computer-related position and have done everything possible to seek employment, from answering newspaper ads to sending out large mailings. I always get the same response: "Call us in two years."

Don't employers realize that they will soon run out of people with two or three years' experience? Has it ever occurred to these employers that recent college graduates could be an invaluable investment in their futures?

A Recently, I asked a room full of MIS managers if they had openings for programmers or analysts. Then I asked them if they planned to fill these slots with experienced personnel or with recent graduates. All but one responded that they had openings, and all of those indicated that they were seeking only experienced personnel.

The problem persists, but, I hope, not for long. Most said that they were having considerable difficulty recruiting qualified people.

The conversation that ensued painted a grim picture for those seeking experienced personnel. As we talked on, I and others touted the value of recent grads, and several vowed to return to the college market. I hope this starts a trend.

Long, president of Long and Associates, is a consultant, lecturer and author in the field of information services. If you have a question you'd like him to address, send it to Larry Long, Editorial Department, Computerworld, P.O. Box 880, Framingham, Mass. 01701.

MAPPER SYSTEMS

MAPPER is a trademark of Sperry Corporation. © 1984 Sperry Corporation

A unique kind of computer power helps them put out fires faster.

New York. A city of 300,000 buildings, each with its own idiosyncrasies of structure and materials.

A Rubik's cube for firefighters.

Maybe worse. Ten thousand of those buildings aren't what they seem, because of non-visible alterations. Brick may conceal impenetrable steel-clad walls. Cellars may be obscurely interconnected.

When New York's firefighters are dispatched to a fire, they have this kind of vital infomation immediately at hand. Through a unique computer system called the Sperry MAPPER™ System.

MAPPER is a non-procedural, interactive system that enables non-computer people to develop their own computer applications.

In the case of the New York City Fire Department, the firefighters, themselves, report local building modifications directly to a main computer data base, using remote terminals. The information is therefore timely and accurate. And precisely defined in terms of the firefighters' needs.

According to Ernest Owens, Director of the Department's Bureau of Information and Computer Services, MAPPER has put the Department 2½ years ahead of schedule in implementing this and other computer systems. It has enabled only three programmers to accomplish what would otherwise have occupied 45 programmers, fulltime.

The fact is, MAPPER is broadly applicable to just about any task, from the routine to the highly specialized. Owens' people have used MAPPER to develop 27 applications so far, with twice that number in the works.

As Ernest Owens sees it, "If you have a creative mind, there is no end to where MAPPER can take you."

Can MAPPER be useful to the purposes of *your* creative mind? We invite you to investigate further. Call us for more information, toll-free: 800-547-8362. Or write Sperry Corporation, Computer Systems, Department 100, P.O. Box 500, Blue Bell, PA 19424.

We understand how important it is to listen.

IBM users group chooses officers

CHICAGO — John E. Nack, manager of the processing and network division at Caterpillar Tractor Co. in East Peoria, Ill., has been elected president of Guide International, the association of users of large IBM systems.

Other officers include Eddie G. Depew, manager of application development for Monsanto Research Corp. in Miamisburg, Ohio, elected vice-president/administration; John Pullam, national manager for data processing at Simpsons-Sears Ltd., Toronto, chosen as vice-president/conferences; Janet S. Smith, manager of the systems development division at Railinc, Washington, D.C, elected vice-president/planning & finance; and Gary S. Geeme, manager of resource evaluation, performance and capacity planning divisions at Deere & Co., Moline, Ill., chosen as vice-president/divisions.

Guide's 2,500 members meet three times a year.

Blis/Cobol meeting set for May 12-17

LAKE BUENA VISTA, Fla. — The Blis/Cobol Users Group has scheduled its annual meeting for May 12-17 at the Dutch Resort Hotel here.

Events and classes will include sessions on communications between Blis/Cobol and microcomputers, advanced programming efficiencies, hardware manufacturers' presentations, future enhancements of Blis/Cobol and reviews of the operating system.

The registration fee for members is $125 and $175 after April 1. The cost to non-members is $325 and $375 after April 1.

Additional information is available from the Blis/Cobol Users Group at Suite A, 450 Wymore Road, Winter Park, Fla. 32789.

HRSP forum to discuss people, data

FORT WORTH, Texas — The Association of Human Resource Systems Professionals, Inc. (HRSP) will hold it fourth annual conference, "People, Data and Systems ... Putting It All Together," at the Hyatt Regency here May 20-23.

The conference plans to examine automated personnel information systems and human resource management needs served by such systems.

Twenty-four workshops and six roundtable discussions are scheduled. Workshop topics will include position control, salary forecasting and office automation.

The seminar costs $400 for HRSP members and $500 for others. Additional information is available from HRSP, which is located at 3051 Adeline St., Berkeley, Calif. 94703.

Application monitoring	Unlimited number standard
Individual transaction record available	Yes
Network alarms	33 types
Immediate display of network alarms	Yes
Intelligent line data display	Yes
User-programmable automatic alarm trap	Yes
Protocol discrepancy alarms	Yes
Line utilization analysis	12 real time and 30 database components
Network configuration recognition	Automatically generated and verified
Entire database available to host	Yes
Local (non-host) database	Yes
Low maintenance design	Yes
Special A.C. power	None required

Utility helps service firm perform quality assurance

DENVER — Randall Smith, production control manager of a bank service company here, started looking last year for ways to streamline the operation of his newly formed quality assurance group.

He wanted to find a utility that would help the internal auditors compare two versions of one program as well as allow programmers to perform data comparisons and point out the changes.

Smith's department had been promised a number of tools to help audit system modifications in programs used at Affiliated Bank Services Co. (ABSC). "A file comparison utility was something that I thought could help that department intelligently pursue its goal," Smith said.

He needed a utility that would run on the firm's IBM 3083 mainframe under MVS, one that could be used by both internal auditors and programmers. "There is an IBM utility that does crude comparisons. It will tell you two files are different, but won't say how or do any analysis," Smith said. He knew right away that the IBM utility didn't fit ABSC's needs.

Although several other companies' products were considered, ABSC only tested seriously Comparex from Sterling Software Marketing of Sacramento, Calif., a much less expensive utility by Harlan S. Hersey, Inc., and Quality Systems Corp.'s Res-q.

Comparex has two modes of comparison, a test mode that synchronizes by lines and a data mode that synchronizes by keys (fields). For comparing checking out system changes in files, the data mode has proved to be more appropriate.

Comparex can handle all file organizations, including Vsam, Isam and partition data sets (PDS). At ABSC, Vsam is generally used because of its high speed. Comparex allows comparison of source code, object code and load modules.

Its PDS (library) function can compare all members, new members only or directory members, based on a wild card. "No matter what you come up with, it can be matched," he said.

There is also some screening ability. "We could say we only wanted members starting with XYZ or even ending with XYZ," Smith said.

Some of the features of Comparex that particularly appealed to Smith were the I/O options. "You can squeeze characters out, which was useful for our purposes. If you specify that you want blanks ignored, that's what it will do," Smith said.

Comparex can compare a file from the beginning down to a certain point or from the end up, but it cannot compare a section somewhere in the middle, Smith pointed out. The Quality Systems' utility had the ability to take a section out, which was a point in that firm's favor.

Smith decided to go with Comparex. The result of the Comparex installation, which was purchased in late September, seems to be an increase in quality, though specific improvement has not yet been gauged.

Most of the code at ABSC is purchased, according to Smith. The programmers are pleased with the addition of the comparison utility because it makes it easy to determine changes that have been made to the programs that have been bought.

"We justified the purchase on less than 1% efficiency. There has been an increase in quality, I've been told, but I couldn't say how much," Smith said.

The one thing missing from the Comparex utility is a direct interface to Panvalet, a library control system from Panaophic Systems, Inc. "I've suggested the addition of a Panvalet interface, which may be added by this time," Smith said. "

CCA EMACS

The most complete screen editor available for Unix[1] and VAX/VMS[2].

CCA EMACS from Computer Corporation of America has the greatest combination of power, speed, and functionality of any text editor available for Unix or VAX/VMS. With close to 400 built-in commands, CCA EMACS allows virtually any editing task to be accomplished in just a few keystrokes, including tasks that would be difficult or impossible to do using other editors. In addition, a set of more than 60 predefined variables allows each user to customize CCA EMACS to meet various application needs and user styles. All of these features are supported by a full online documentation package that can assist the user at any point, giving information that ranges from the definition of a single command to manual pages that contain complete explanations of major CCA EMACS features.

Operating Environment

Runs on Berkeley Unix (4.1BSD and 4.2BSD), Bell Unix (System III and System V), and VAX/VMS. Requires 500 K of address space.

Price

Prices for a full source license range from $350 to $2400. Contact CCA for further details.

Computers took the strain out of processing data.

Now Raytheon has taken the strain out of data processing.

Introducing the PTS-1000/4000 family of 3270-type information display systems. Designed to combine mainframe compatibility, operator comfort, and peace of mind for DP managers too.

How can we promise all that?

After more than a decade of experience in 3270 emulation, Raytheon designed the PTS-1000/4000 family to offer the utmost in flexibility, so you can mix and match any of our new controllers with any of our new display and printer terminals.

When it comes to operator comfort, no one offers interactive displays with more built-in ergonomic features than Raytheon. Features especially designed to ease the strain on one's neck and back, hand and wrist, and eyes.

The microprocessor-based PTS-1000/4000 family enables efficient distribution of your data processing workload with flexible configuration options and extensive self-diagnostic capabilities. Binary synchronous, systems network architecture (local and remote), and airline link control communication protocols are supported. Large and small control units, multiple screen sizes, and a wide variety of peripheral input/output devices and printers can be mixed and matched with varying star, multidropped cabling, or multiplexed configurations.

Special system features include productivity enhancements like local format storage, response time monitors, row/column indicators, and unprotected field indicators.

As for the DP manager's peace of mind, Raytheon offers flexible financing and leasing options, competitive pricing, over 2000 service people worldwide, and a commitment for today and tomorrow that can come only from the largest independent supplier of intelligent terminal processing equipment.

The PTS-1000/4000 information display systems from Raytheon Data Systems. We take the strain out of your data processing. For the sales office nearest you, check your telephone directory or call 1-800-343-6676.

Subscription service credits its swiftness to on-line net

BIRMINGHAM, Ala. — One of the world's largest subscription agencies credits its swiftness of service to an on-line data communications network that can handle 130,000 daily transactions.

Fifty thousand organizations in more than 50 countries rely on Ebsco Subscription Services (ESS), a division of Ebsco Industries, Inc., to deliver periodicals needed by researchers, executives, technical experts, students and professors. In 1982, it handled millions of subscriptions to 160,000 unique titles that were delivered to 420,000 addresses.

"We're a one-stop supermarket for anything published on an ongoing basis anywhere in the world," said F. Dixon Brooks Jr., vice-president of operations. "That includes newspapers, periodicals, monographs and government publications, as well as videotex and microforms."

Subscription services

According to John Krontiras, vice-president and general manager of data processing, about 70% of his 83-person department's work load relates to subscription services. "That's understandable, given the size of the data bases we manage," Krontiras said.

"We add an average of 17,000 titles a year to a data base that now includes more than 160,000 titles offered by some 55,000 publishers. On each title, we keep complete pricing and bibliographic data, involving about 10,000 record changes each month.

"Also, since a single corporation may subscribe to 500 periodicals for distribution to offices in dozens of cities, our files include not only 50,000 bill-to addresses, but 420,000 ship-to addresses," he added.

"Because ESS is growing, our data processing requirements keep expanding. In 1979, we processed about 1.5 million subscription orders. During 1982, we handled more than 4.2 million orders. And a single order may represent many subscriptions," he said.

This constant ESS growth has made Ebsco an expert at computer system upgrades. Since the privately held company installed an IBM 1130 computer in the mid-1960s to begin subscription service automation, it has migrated through several series of IBM processors.

With its 1982 upgrade, Ebsco stepped up to twin 8M-byte IBM 4341 Model Group 2 processors with 25G bytes of disk storage capacity.

In recent years, on-line requirements have driven DP activities. Ebsco dedicates one IBM 4341 system to on-line operations, supporting an internal network that embraces 250 IBM 3278 display stations located in 14 U.S. and foreign Ebsco offices, 10

WIP to host conference April 6-8

PHILADELPHIA — The Advance 1984 International Conference, sponsored by Women in Information Processing (WIP), will be held April 6-8 here at the Bellevue Stratford Hotel.

Amy Wohl, president of Advanced Office Concepts Corp., will deliver the keynote address. The conference, for managers, professionals, users and students of information processing, will focus on subjects ranging from fifth-generation computing and artificial intelligence to career development and stress management.

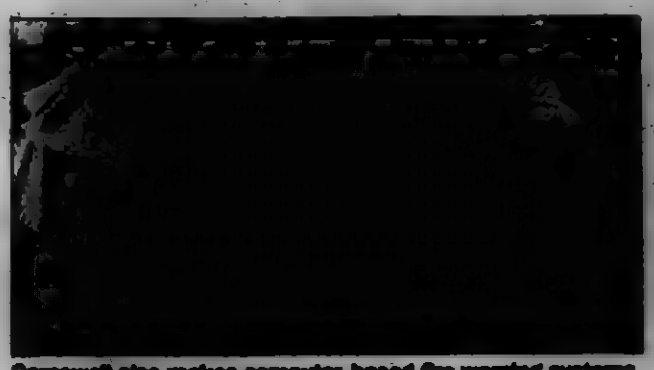
Registration fees are $240 for WIP members and $290 for nonmembers. Further information is available from WIP, Lock Box 39173, Washington, D.C. 20016.

The Northern Telecom system:
A benchmark in batch processing that keeps getting better.

Northern Telecom batch processing systems have proven themselves, in more than a decade of use in a variety of applications, to be among the most reliable, practical, cost-effective systems ever developed. They deliver more throughput per dollar than any competitive system.

Now, as solid evidence of our commitment to batch processing, we're improving these already-successful systems for even more productivity. For instance, we're introducing a new high-speed band printer with changeable type. Operating now with IBM's SNA, we've also added new, low-cost distributed data processing capabilities for more system versatility, and to provide for future growth toward the integrated office.

We're back



Gamewell also makes computer-based fire warning systems.

Move on-line provides manufacturer with up-to-date inventory information

MEDWAY, Mass. — Increased business, up-to-date inventory information and accurate work-in-progress reports were the chief goals set by Gamewell Corp. in converting from the batch processing of manufacturing data to an on-line, interactive system. Gamewell, which has been manufacturing fire protection equipment since 1852, has its offices and its plant here.

"When I came here in 1981, we had a batch processing system running on a 10-year-old computer," MIS Director Andreas B. Greuter recalled recently. "Given the size of the company, it was a very advanced system for its day. However, time has overtaken it. Our business had progressed to the point that only a complete overhaul would do."

The search to replace the existing IBM System/3 Model 10 was spurred by significantly increased business: Gamewell's sales had doubled from 1978 to 1982. On-line, up-to-date information was essential for the improvement of material management, but the old system was able only to compute costs after jobs were finished. It had no accurate ability to report exactly what the status of each job-in-progress was and what labor and material costs had been charged to it.

"With the batch system, the inventory was updated, and a report was printed weekly," Greuter said. "After a couple of days, the report was out of date and we began to lose track of the inventory until the next report was printed. Some items are critical to production, so we had to watch their actual counts closely."

Greuter and his staff considered updating the existing system, but decided against "a stopgap approach that might work for another two or three years. . . . We wanted to provide a tool for the future — perhaps something that could serve us for the next 10 years."

Most hardware vendors wanted Gamewell to use outside software houses either to develop the needed programming or to modify the vendor's programming to fit Gamewell's needs. But, Greuter said, "We wanted to deal with a company that could furnish the computer, the software and the software modifications."

The vendor's ability to modify the programs was particularly important, he added; the Gamewell DP department consists of a DP manager, his assistant and two part-time computer operators. The group had neither the time nor the programming expertise to undertake major modifications.

The system selected was NCR Corp.'s 9040 computer with NCR's Interactive Manufacturing Control System II (IMCS II) software. The computer had 1M byte of main memory and 135M bytes of disk memory. It was installed in August 1982 with 13 CRT terminals at various locations in the office and plant. Already, according to Greuter, an additional 1M byte of memory has been added to accommodate a total of 28 terminals.

The IMCS II software

See IMCS page 40

Your processing may be remote, but Northern Telecom service is on the spot.

With service and maintenance professionals located at 157 cities nationwide, we're able to provide prompt response to your call for service. How fast? Two hours in major metropolitan areas; four hours in most other areas of the country. And our multi-year maintenance agreements guarantee continuing, low-cost operation of your Northern Telecom system.

If your system lease expires within the next six months, *now* is the time to find out more about batch processing from Northern Telecom.

Time-proven performance with long-term savings.

Northern Telecom's aggressive pricing is more proof of our commitment to batch. Our discount structure offers long-term savings on multi-year leases. And at renewal time, you can save even more with discounts up to 30%.

Call our toll-free number: 800-331-3113. Or write Northern Telecom, Mail Station T-240, P.O. Box 1222, Minneapolis, Minnesota 55440. We'll show you how we can tailor a batch system to your specific needs. And save you money, too.

IBM 3279 color display stations as well as 20 daisywheel printers in regional offices.

The system also supports Ebsconet, an expanding external customer network. Within 18 months of introducing Ebsconet, the company found itself supporting on-line terminals at more than 130 customer locations.

Info-handling business

"We're really in the information-handling business," Brooke said, "and the ability to order periodicals via computer terminals isn't the main reason customers want our on-line services.

"Rather, they want to tie into our data bases to gain instant access to the information they need to make prompt, intelligent decisions," he added.

Work began in 1977 on an on-line pilot project to link the University of Alabama's Lister Hill Library of Health Sciences to Ebsco's computer system.

For this pioneering effort, Ebsco modified a software package acquired from the University of California at Los Angeles biomedical library. Now Ebsco provides the resulting Serials Control System and an On-line Subscription Service (OSS) to libraries and information centers.

Given about 24 hours, Ebsco can link any customer computer terminal to its host IBM 4341 computer and its central data base, which contains both separate and merged files, according to Brooke. Dial-up access is provided through Tymnet, Inc. telecommunications services.

Eliminated tedious tasks

OSS has automated many tedious and time-consuming manual subscription tasks. The cost of processing new orders is estimated at $20 to $75 per title for organizations using manual methods.

But with individual customer order requirements and complete title data built into Ebsco's data base, an OSS user can place an order in about 30 seconds.

"Our network uptime is now greater than 98.5%," Krontiras said. "Ebsco staffers and customers making 130,000 on-line transactions daily can count on a response time of four seconds or less.

"We've achieved this performance by converting from Bisynchronous Communications to an IBM Systems Network Architecture telecommunications environment, adding hardware and software monitors and dedicating staff to data communications," he added.

Each Ebsco regional office is equipped with an IBM 3274 control unit, while an IBM 3705 communications controller at headquarters handles all incoming lines.

State-of-the-art diagnostic tools, including a Digilog, Inc. network supervisory system, enable Ebsco to isolate and solve problems immediately.

The Digilog system takes advantage of IBM CICS software.

Krontiras lists CICS as one of a half-dozen valuable IBM network software aids.

IMCS from page 39

package is modular, with up to nine application modules interacting through a common data base. As an example, the inventory data shows, in a real-time mode, the quantity put to stock within the purchasing/receiving module, the quantity a production order has been opened for in an inventory-control screen and the quantity entered as shipped against a sales order in the order processing module, which was modified to meet the company's needs. There were problems making the transition, according to Greuter, but nothing insurmountable.

In addition to maintaining the perpetual inventory, the programming makes it possible to cycle count the physical inventory and come up with increasing accuracy. Based on the results obtained so far, counting 130 different parts each week, Gamewell is confident that cycle counting will replace the annual wall-to-wall physical inventory.

Greuter feels the new system is meeting the objectives set for it. "Our bottom line with this new system was to provide our people with a tool consisting of up-to-date management information. Since we started placing terminals in the plant, we have seen a steady increase in their use. That acceptance is probably the best recommendation our people can give."

ASI launches four courses

ARLINGTON HEIGHTS, Ill. — Advanced Systems, Inc. (ASI), a producer and distributor of on-site training courses for large organizations, is offering four multimedia courses dealing with technology and work center management.

"Managing the Economics of the Advanced Stages" is said to provide corporate executives with an overview of the value of computers. The other programs are "Technology Perspective: Harnessing the Productivity Potential of MVS/XA," "Work Center Management" and "Dispatching and Shop Floor Control."

The programs range in price from $50 to $100 per tape, depending on the leasing arrangement. They are available now from ASI, 2340 S. Arlington Heights Road, Arlington Heights, Ill. 60005.

PREV
BAD

IT SPREADS.
CORRUPTS.
ERODES.
DESTROYS INTEGRITY.

Bad data is really bad news. Because it's impossible to get good information from bad data. And once bad data gets into a system, there is no cure. The bad simply gets worse.

There is only one way to guarantee good information: *PREVENT BAD DATA.*

TSI International can do just that. We're the good information specialists. With software designed specifically to make sure your data starts good and stays good. Our products will capture, control and deliver consistently good data to assure nothing but good information. You can depend on it. No one knows more about how to prevent bad data than TSI.

Package enables insurer to control forms inventory

Unionmutual building

PORTLAND, Maine — When a major insurance company here began to lose control of its inventory of 15,000 printed forms, it turned to a software package for assistance.

A leader in the field of long-term disability insurance, Unionmutual Life Insurance Co. has grown nearly tenfold in the last decade — its assets increased from $378 million to $3 billion in the period from 1978 to 1982 alone. The firm's need for printed forms grew just as rapidly. The burgeoning inventory of forms had been controlled through a manual card file system, but duplicate purchasing orders, recurring inventory shortages and order fulfillment delays made it obvious that it was time to automate.

A Unionmutual study team determined that a packaged software system would be more cost-effective than one developed in-house by the company's programming staff. Management representatives then visited other firms with automated inventory control systems, including the First National Bank of Boston. First National had implemented Management Science America, Inc.'s (MSA) Inventory and Purchasing System package.

Unionmutual considered several other packages, but decided upon the MSA Inventory and Purchasing System because it was the only package that could calculate consumption — or usage — rates on an ongoing basis, according to senior programmer/analyst Frank Rivera. Turning to the task of implementation, the project team first reviewed the card file information and simplified it to the bare essentials.

Next, data from the three card files in the supply, forms management and purchasing departments was entered into the system. Unionmutual continued to use the manual system in conjunction with the MSA package — a parallel run of sorts — until staff members were satisfied that the automated inventory system was completely functional.

Workers soon found that referencing an inventory item was much easier with the new system. "The project team chose to use the final five positions of the item description to indicate the latest date of any printed revision," Rivera said. "Our legal department, for example, may be doing research and needs to know which long-term disability claim form was used in New York in 1972. With the Inventory and Purchasing System, we can have an answer in minutes."

Currently, Unionmutual runs the MSA package on its IBM 3081 mainframe under MVS to keep track of 15,000 forms used in the more than 90 offices it maintains nationwide. The system has made it possible for Unionmutual to group forms by name as well as number. The categories, such as application, claim, policy page and proposal, are listed alphabetically in the supply catalog. In addition to standardizing naming conventions within the company, that feature has been useful to employees unfamiliar with the form numbers.

But the biggest advantage of the MSA software, according to Rivera, is that the firm can determine on an ongoing basis the number of forms used. "Because we're growing so fast, our average monthly usage is changing. The system not only tells us how many more months our present stock is going to last, but also where our reorder points should be set.

"We can review our information periodically and make the necessary changes," Rivera said. "This has given us one central place to access the information we need."

Because purchasing can project printing needs more accurately, Unionmutual can avoid emergency buying and negotiate with vendors for the best possible prices. The system has also helped the firm identify forms that are similar from a printing aspect, Rivera said, and that capability has allowed Unionmutual to combine form orders to reap the benefit of competitive bidding for larger orders.

FACETS. Preventing bad data begins with stable database designs. This leading edge design tool assists in all phases of database projects, from information analysis to finished design.

KEY/MASTER. From the moment you capture data, this widely used on-line data entry system helps you screen bad from good — to assure initial and ongoing accuracy.

DATA CATALOG 2. By applying inventory techniques to information, this dictionary system controls your good data — to keep it good.

DATA ANALYZER. As a powerful information center tool for the retrieval and analysis of production data, it will help turn your good data into good information.

DOCU/MASTER. A new way to deliver all your good information — from highly structured data to unstructured text. This on-line information system allows users to query any way they want.

TSI International. The good information specialists. For good data that produces good information, call us at 800-227-3800, Ext. 7005. You can rely on TSI.

Ford goes in-house for structural analysis

DEARBORN, Mich. — Analyzing more than 12,000 individual finite elements on a car body and 11,400 on the engine block is a task that Ford Motor Co. engineers here can only accomplish with the aid of computers.

"It is only with powerful computers and software that we are able to identify possible weak spots, simulate operations and analyze results," explained Dr. P. Perumalswami of Ford's Structural Analysis Department.

The Structural Analysis Department is a focal point for company-wide use of finite-element technology, he said. The department develops new methods, trains personnel and offers consulting and analysis service companywide, besides undertaking large and complex analysis tasks such as vehicle structures, power-train assemblies and dynamic studies.

The department serves "a couple of hundred users" via telephone lines, according to Perumalswami, and additionally provides time-sharing services to Ford engineers in the U.K. and Germany.

Ford has used computers to analyze car structures and components since the early 1970s. Then, the company was using Control Data Corp.'s Cybernet Services' cadre of Cyber 18 computers, which eventually numbered nearly 200, to develop a structural analysis operation. Now it operates two computers in-house, a CDC Cyber 176 and a Cyber 760.

The Cyber 176 and 760 in Ford's Dearborn Engineering Computer Center are the major tools for Ford's companywide structural analysis program. The computers enable designers and engineers to create mathematical models of surfaces, structures and components and to simulate performance for evaluation and change, if necessary.

The switch from Cybernet to in-house came in 1977; when Ford acquired the Cyber 176; the 760 was installed in January 1983. According to Perumalswami, engineers and designers have access to "Mainframe A" and "Mainframe B," depending on which is available. "We don't distinguish between Mainframe A and Mainframe B," he said. The computer operation accommodates batch processing, on-line processing and time-sharing.

The department's library of mathematical models and simulations is very extensive. "We subject the car and [its] select parts to all types of road conditions, even down to testing the curb-impact capabilities of the wheel rims."

Perumalswami said the ability to analyze 12,000 elements on a car body and 11,400 on an engine is a major advantage. "We've always been aware of where major stress and weak spots could occur, but could not identify those trouble areas that come with time and extensive use. Now we can subject body, engine and components to whatever tests we wish."

Ford's European operations in the U.K. and Germany rely on the Cybers in Dearborn for large-problem processing. The company's European Automotive Operations, headquartered in Dunton, U.K., is equipped with a Cyber 720, but is connected by a 9600 bit/sec satellite transmission network to the Dearborn center's Cyber 176. The Dunton Computer operations, in turn, serve a Ford research center in Merkenich, Germany.

"Because of the time difference, the time-sharing works very well," Perumalswami noted. "The European operations begin transmitting data around 1 a.m. our time, and the processing is usually completed by the time engineers in Dearborn need the computer."

Ford uses MacNeal-Schwendler Corp.'s MSC Nastran (Nasa Structural Analysis) software for about 90% of its analytical work. But it also has developed a broad range of subsystems that interface with Nastran to meet specific design and engineering needs. These programs and other commercially-available codes support a wide spectrum of analyses that relate to crash tests, structural effects of thin body parts, placement of engine mountings, vibration studies, bumper design and many others.

One such application is Ford's Movie.Byu, a software package that uses shades of color to pinpoint areas of high stress and structural weakness. When loads and constraints are applied to a particular part of body surface, the weak spots become obvious through color coding.

Ford's around-the-clock structural analysis computer center is supported by a staff of approximately 50 analysts. About 20 disk packs are mounted daily to handle the work load. Data storage is handled by 17 CDC 844 disk drives and 12 CDC 885s, for a total capacity of 15.6 billion bytes of information.

What do top computer professionals usually say when we tell them about our unique, completely portable software?

"Show me!"

And actually we are not surprised. After all it took us 5 years to figure out how to do it. And now that we've gotten over that hurdle our biggest problem has been convincing people that Tominy's* completely portable application development system really works.

Tominy allows you to develop completely portable application programs which can be used without modification on micros as well as mainframes and everything in between. That means no more costly and unproductive time spent in developing special systems to fit individual computers. With Tominy one size fits all.

We have such confidence in the system that we offer it with a 90 day no questions asked money back guarantee.

Because it is not possible to tell you here everything our portable application development system does, we have ready to send you a kit that not only offers detailed information on how the system operates but also shows how it is presently being used to increase productivity and reduce costs in over 1000 installations nationwide, including 25 of the Fortune 500 companies. It's yours free for the asking if you send in the coupon or call (513) 984-6605.

We are sure that after reading it Tominy will make a believer out of you too.

Tominy
Once is finally enough.

*Tominy's completely portable application development system is presently available for IBM's PC, System/34, System/36, Series/1, 43XX, 30XX, 370xxx, DEC VAX/VMS systems, UNIX and XENIX operating systems.

☐ I'd like to be convinced. Send me your information kit.

You Are Cordially Invited to a Free Focus Seminar.

FOCUS is the 4th generation DBMS that gives you all the necessary tools for fast and successful application development. Only FOCUS combines modern database technology and 3270 screen design with an English nonprocedural language for reporting, graphics, financial modeling and statistical analysis.

This Seminar will show you how FOCUS can:

Build complete screen-driven database applications.

FOCUS' built-in screen facilities include forms creation and design, PF key scrolling, dynamic control of color and other terminal attributes, data validation, table lookup and complete logical and computational facilities.

Capitalize on existing files and databases.

Powerful relational facilities enable you to read, join and report from any file in your data center (QSAM, VSAM, ISAM, IMS, IDMS, TOTAL, ADABAS, MODEL 204).

Integrate your micro/mainframe environment.

PC/FOCUS puts mainframe FOCUS on your Personal Computer, expanding it into a personal mainframe. And PC/FOCUS includes micro/mainframe communications for download/upload of critical mainframe data used for analysis and updating.

Fulfill your Information Center requirements.

Your end users can quickly learn and use FOCUS' simple English statements to perform their own queries, reports, graphics and analyses—even build simple database applications. Industry surveys shows that FOCUS is the leading 4th generation Information Center database system.

FOCUS runs on IBM or compatible mainframes under MVS (with TSO, CICS, IMS/DC), VM/CMS or OS. PC/FOCUS is available on the IBM PC/XT or XT/370 and the Wang and Texas Instruments Professional Computers.

Seminar Format: The Seminar is designed to give both DP Professionals and DP End Users a complete overview of FOCUS. It is three hours in length, including a refreshment break. The presentation features a comprehensive online demonstration. Questions and discussion are encouraged. Registration for the AM Seminars beings at 8:30 a.m. The PM Seminars begin registration at 12:45 p.m.

CALENDAR

WEEK OF APRIL 1

APRIL 3-6, BOSTON — **Structured Design and Programming.** Contact: Ruth Dordick, Integrated Computer Systems, 6305 Arizona Place, Los Angeles, Calif. 90045.

APRIL 4, NEW YORK — **Introduction to Dbase II.** Contact: Center for Advanced Data Processing, Suite 402, 450 Seventh Ave., New York, N.Y. 10123.

APRIL 4, NEW YORK — **IBM 3100 Users Group.** Contact: Con Edison, 4 Irving Place, New York, N.Y. 10003.

APRIL 4-5, GREENBELT, MD. — **Relational Data Base Systems.** Contact: Center for Management Development, College of Business and Management, University of Maryland, College Park, Md. 20742.

APRIL 4-6, HOUSTON — **Systems Analysis and Design: Concepts and Effective Practices.** Contact: Datapro Research Corp., 1805 Underwood Blvd., Delran, N.J. 08075.

APRIL 4-6, SEATTLE — **Data Base Management.** Contact: Center for Advanced Professional Education, Suite 110, 1820 E. Garry St., Santa Ana, Calif. 92705.

APRIL 4-6, SAN FRANCISCO — **Network Design.** Contact: Systems Technology Forum, 9000 Fern Park Drive, Burke, Va. 22015.

APRIL 4-6, NEW YORK — **Local-Area Networks.** Contact: Center for Advanced Professional Education, Suite 110, 1820 E. Garry St., Santa Ana, Calif. 92705.

APRIL 4-6, CHICAGO — **Fundamentals of Data Communication.** Contact: American Management Associations, 135 W. 50th St., New York, N.Y. 10020. Also being held April 9-11 in Washington, D.C., and Philadelphia.

APRIL 4-6, SALT LAKE CITY — **Network Communications Protocols.** Contact: Center for Advanced Professional Education, Suite 110, 1820 E. Garry St., Santa Ana, Calif. 92705.

APRIL 4-6, SEATTLE — **Layered Network Architecture and the ISO Seven-Layer Standards.** Contact: Data-Tech Institute, 386 Franklin Ave., P.O. Box 569, Nutley, N.J. 07110.

APRIL 4-6, SAN JUAN, PUERTO RICO — **Personal Computers and Networking.** Contact: Center for Advanced Professional Education, Suite 110, 1820 E. Garry St., Santa Ana, Calif. 92705. Also being held April 4-6 in Pittsburgh.

APRIL 4-11, HANNOVER, WEST GERMANY — **Hannover Faire.** Contact: Hannover Faire Information Center, P.O. Box 338, Route 22 E., Whitehouse, N.J. 08888.

APRIL 5, NEW YORK — **Knowledgeman for Application Development.** Contact: Center for Advanced Data Processing, Inc., Suite 402, 450 Seventh Ave., New York, N.Y. 10123.

APRIL 5-6, HOUSTON — **Data Communications: Advanced Concepts, Products and Services.** Contact: Datapro Research Corp., 1805 Underwood Blvd., Delran, N.J. 08075.

APRIL 5-6, NEW YORK — **Implementing Voice Technology.** Contact: Patti Restaino, Votan, 4487 Technology Drive, Fremont, Calif. 94538. Also being held April 11-12 in Chicago, April 17-18 in Atlanta and April 24-25 in Dallas.

APRIL 5-6, PHILADELPHIA — **Microcomputers: A Tool for Increased Productivity.** Contact: Association for Systems Management, 24587 Bagley Road, Cleveland, Ohio 44138. Also being held April 9-10 in Chicago and April 12-13 in Milwaukee.

APRIL 5-6, RESTON, VA. — **Local-Area Networks.** Contact: Center for Management Development, College of Business and Management, University of Maryland, College Park, Md. 20742.

APRIL 5-6, WASHINGTON, D.C — **Micro/Personal Computers: State of the Art.** Contact: Digital Consulting Associates, Inc., 339 Salem St., Wakefield, Mass. 01880.

APRIL 5-6, BOSTON — **The IBM Personal Computer: Making It Work in the IBM Mainframe Environment.** Contact: Techtran, P.O. Box 10212, 72 Cummings Point Road, Stamford, Conn. 06904. Also being held April 12-13 in New York.

APRIL 5-6, SAN FRANCISCO — **IBM Systems Network Architecture: A Master Plan for Teleprocessing.** Contact: Datapro Research Corp., 1805 Underwood Blvd., Delran, N.J. 08075.

APRIL 5-7, NEW YORK — **The 1984 Lasers in Graphics Seminar.** Contact: Dunn Technology, Inc., 759 E. Vista Way, Vista, Calif. 92083.

APRIL 5-7, LOS ANGELES — **Comdex Winter 1984.** Contact: The Interface Group, Inc., 300 First Ave., Needham, Mass. 02194.

APRIL 6, GREENBELT, MD. — **Relational Data Base Design Techniques.** Contact: Center for Management Development, College of Business and Management, University of Maryland, College Park, Md. 20742.

APRIL 6, NEW YORK — **Advanced PC-DOS 2.0.** Contact: Center for Advanced Data Processing, Inc., Suite 402, 450 Seventh Ave., New York, N.Y. 10123.

APRIL 7-8, NEW YORK — **CICS Command Level.** Contact: Sysed, One Park Ave., New York, N.Y. 10016.

WEEK OF APRIL 8

APRIL 8-12, ORLANDO, FLA. — **Synergism '84: Micro International's Ninth Conference for Microcomputer Users.** Contact: Micro International, P.O. Box 497, Barrington, Ill. 60010.

APRIL 9, KANSAS CITY, MO. — **Introduction to Micros.** Contact: U.S. Professional Development Institute, Microcomputers in Government, Department AB, 1620 Elton Road, Silver Spring, Md. 20903.

APRIL 9, NEW YORK — **Introduction to the IBM PC.** Contact: Center for Advanced Data Processing, Inc., Suite 402, 450 Seventh Ave., New York, N.Y. 10123.

APRIL 9, BOSTON — **The Telecommunications Future.** Contact: The New England Council, Inc., 120 Boylston St., Boston, Mass. 02116.

APRIL 9, NEW YORK — **Word Processing With Wordstar.** Contact: Center for Advanced Data Processing, Inc., Suite 402, 450 Seventh Ave., New York, N.Y. 10123.

APRIL 9-10, SAN FRANCISCO — **Local-Area Networks: Selection Guidelines.** Contact: Datapro Research Corp., 1805 Underwood Blvd., Delran, N.J. 08075.

APRIL 9-10, OTTAWA — **Dbase II.** Contact: Center for Advanced Professional Education, Suite 110, 1820 E. Garry St., Santa Ana, Calif. 92705. Also being held April 11-12 in Toronto, April 16-17 in Calgary, Alta., April 18-19 in Vancouver, B.C., April 23-24 in Arlington, Va., and April 25-26 in Washington, D.C.

APRIL 9-10, ORLANDO, FLA. — **Computer Negotiations Workshop.** Contact: International Computer Negotiations, Suite 1707, 200 St.

DEC TO IBM SNA

Now available...full SNA capability for your DEC computer! Comboard/SNA gives your terminals access to IBM interactive applications. Data can be transfered between systems transparently, all in the complete fully supported package, from Software Results.

Comboard/SNA is a proven and reliable, single-board, 256KB communications computer that plugs into your DEC Unibus. Teamed with Comboard software, the system is a cost-effective solution to troublesome SNA communications problems.

Comboard/SNA allows your DEC to emulate an IBM PU Type 2 communications node. You have a full gateway into your SNA without the trouble of passing through a secondary network.

For further information, fill in the coupon below or call Software Results... the leader in DEC to IBM communications.

BECOME A VSAM EXPERT.

SysEd's new 5-day VSAM course will make you a VSAM expert. You'll not only learn how VSAM works, but *how to make it work well*, and what to do if things go wrong. Even if you're already using VSAM, you'll gain a better understanding of its capabilities and flexibility . . . like how to select among the options VSAM offers for configuring data sets, both batch and on-line.

Our hands-on case study instruction begins the very first day. You'll write and test three real-life programs and use Access Method Services on our own 4341 / II computer. There are eight 3270 terminals dedicated to the class. You'll receive individual attention from our experienced teachers, and you'll want to bring your actual programming and debugging problems to class.

SysEd's VSAM course contains the most up-to-the-minute information available anywhere, including the latest features and capabilities of VSAM, and is in line with state-of-the-art hardware.

SysEd courses are held weekly and on weekends at our training centers in New York City, Chicago, San Francisco and Dallas. On-site courses at your own computer installation are also available. *Classes are limited.* For early enrollment or more information call Dave Shapiro (212) 689-3386.

Cullinane to keynote IEEE meet

SILVER SPRING, Md. — John J. Cullinane, chairman of the board of Cullinet Software, Inc., will be the keynote speaker at the 1984 Trends and Applications Conference (Trends and Applications '84), which will take place here May 22. The title of Cullinane's talk will be "Data Base Management Systems — Fact and Fiction."

Trends and Applications '84, sponsored by the Institute of Electrical and Electronics Engineers (IEEE) Computer Society, will be held at the National Bureau of Standards in Gaithersburg, Md. The theme of the conference is "Making Data Base Work."

The registration fee for the two-day conference is $50 for IEEE Computer Society members, $60 for nonmembers.

More information is available from the IEEE Computer Society, which can be contacted through P.O. Box 639, Silver Spring, Md. 20901.

June 12 meet to discuss factory computerization

CHICAGO — The Advanced Manufacturing Systems (AMS) Exposition and Conference will be held at McCormick Place here June 12-14.

The theme of AMS '84 will be "The Computer: Mind of the Factory of the Future." Information systems and automated production systems directed to the needs of manufacturing companies will be demonstrated.

The sessions and full-day short courses will cover aspects of computer-integrated manufacturing. Exhibits will include computer-aided design and manufacturing systems and peripherals.

Information on the exposition is available from AMS '84, 706 Third Ave., New York, N.Y. 10017.

EDITORIAL

Fujitsu: good for business

Users of Amdahl Corp. equipment who also happen to be fervent "Buy American" adherents are likely feeling a bit uneasy these days following the announcement that Fujitsu Ltd. of Japan will own just under 50% of Amdahl (CW, March 12).

But U.S. users of all types of information processing equipment may benefit from Fujitsu's acquiring what some analysts feel is de facto control of an established American firm.

Amdahl has not been a truly American business for some time now. Fujitsu has had three directors on Amdahl's board and has supplied a reported 20% of the components used in Amdahl's 580 line of mainframes.

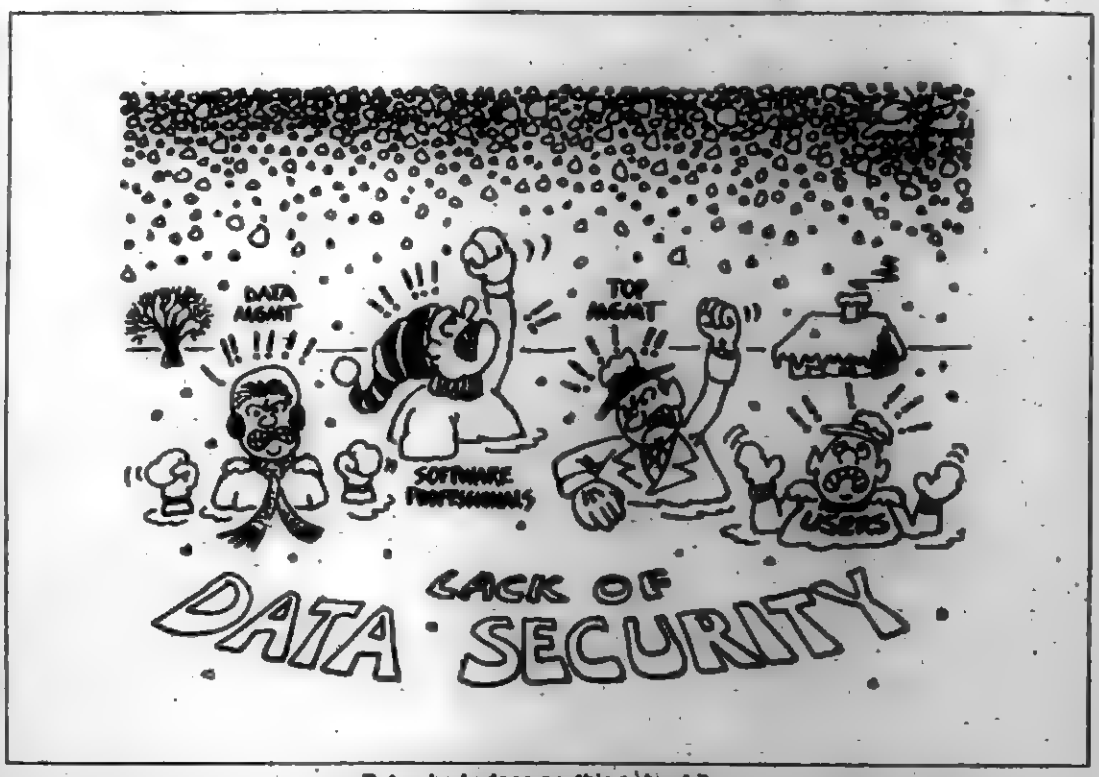
For several reasons, *Computerworld* expects Fujitsu will proceed cautiously while converting the Amdahl organization to a distributor of Japanese products, which eventually it must. Any rapid and blatant strategy to flood the U.S. market with Fujitsu products can only flame the ever-present congressional embers of trade protectionism and lead to legislation that could hurt everyone.

Fujitsu is likely to proceed at a cautious pace with this experiment, retaining the prerogative of pulling out if something goes wrong, and letting market acceptance determine how great its commitment will be.

This is very much an experiment that should not be confused with the American defeat on the earlier fields of consumer electronics. Unlike the American television vendors vanquished by Japanese competition, American computer vendors are truly multinational companies that have the resources and the technology to compete in many markets. What Fujitsu can do here, surely IBM and other major U.S. vendors have the potential to do in Japan and other Asian markets.

Consumers generally benefit from competition; therefore, the U.S. information processing community should be cheering the Fujitsu experiment. Many times over the past year, theories have surfaced that it is only a matter of time before IBM can squeeze the plug-compatible manufacturers out of the marketplace; some say the process is already under way. Fujitsu brings to the U.S. market vast resources and an impressive product line that offers something for every level of performance requirements. Fujitsu is not a limited player that will catch cold every time IBM sneezes.

Another factor to be considered is that the more Fujitsu becomes entangled in the U.S., the more the U.S. becomes entitled to Japanese technology. International trading requires manufacturers to cast off the blinkers of provincialism and answer to another sovereign — the bottom line.



But nobody does anything about it.

LETTER

Outlay of money to save lives should be encouraged

I am concerned by *Computerworld*'s editorial, "The VDT scare: reason to pause" (CW, Feb. 27), regarding health hazards from VDT radiation to unborn babies.

While acknowledging that from an epidemiological standpoint there is no conclusive evidence that VDT radiation is the cause of the danger to unborn babies, I must, nevertheless, object to the conclusion that the editorial arrives at, namely, that without proof of death and disfigurement to babies, nothing should be done to add protection for the VDT user.

The group mentioned in the editorial — 9 to 5, the National Association of Working Women — is not demanding the withdrawal of VDTs and the resultant economic collapse of the nation, but simply a capital expenditure on the part of employers and manufacturers to ensure protection from a possible hazard.

Conclusive proof on this issue at hand may cost lives.

How can this be demanded from VDT users and their families?

Surely if such an outlay of money might be responsible for saving a baby's life or its physical or mental health, then all of us should strongly encourage, even demand, that such an action be taken.

Jill R. Meyer
Bloomington, Ind.

Computerworld welcomes letters from its readers. Preference will be given to typed, double-spaced letters of 150 words or less; they may be edited for the purposes of clarity and brevity.

Letters should be addressed to Editor, Computerworld, Box 880, 375 Cochituate Road, Framingham, Mass. 01701.

Computerworld is a member of the CW Communications group, the world's largest publisher of computer-related information. The group publishes 33 computer publications in 10 major countries. Nine million people read one or more of the group's publications each month. Members of the group include: Argentina's *Computerworld Argentina*; Australia's *Australian Computerworld, Australian Micro Computer Magazine, Australian PC World and Directions*; Brazil's *DataNews* and *Microbrasil*; China's *China Computerworld*; Denmark's *Computerworld Denmark* and *Microbrasil*; Finland's *Mikro*; France's *Le Monde Informatique, Golden* and *OFC*; Germany's *Computerwoche, Microcomputerwelt, PC Welt, Software Markt, CW Extra-Sonder, Computer Business* and *Commodore Magazine*; Italy's *Computerworld Italia*; Japan's *Computerworld Japan* and *Focus Confidential*; Mexico's *Computerworld Mexico* and *Computerworld*; Netherland's *CW Extra* and *Microbits*; Norway's *Computerworld Norge* and *MikroData*; Saudi Arabia's *Saudi Computerworld*; Singapore's *The Asian Computerworld*; Spain's *ComputerworldEspana* and *MicroBitsness*; Sweden's *Computersvenska, MikroDatorn* and *Att Hantera*; the UK's *Computer Management* and *Computer Business Europe*; the U.S.' *Computerworld, Desktop Computing, Hot CoCo, InCider, InfoWorld, Jr., MacWorld, MICRO MARKETWORLD, Microcomputing, PC World, PC Jr. World, Run, 73 Magazine* and *SunWorld*.

VIEWPOINT

The 'whatchamacallit'

LECHT ON SCIENCE
Charles P. Lecht

Talk about dreams coming true — and happy ones to boot. Before our very eyes, the TV set, the hi-fi, the movie camera, the videocassette recorder, the telephone, the typewriter and the personal computer are fast becoming components of an integrated personal multipurpose thing, which — for lack of a better name — we can call the "whatchamacallit."

Thus, our need to acquire the whatchamacallit's components as discrete consumer items is diminishing; and as our whatchamacallit's capabilities improve, so will our needs diminish for such items as desk calculators, still cameras, voice-recording telephone answering machines, ham radio equipment — all the electronic doodads you can think of.

Other tried-and-true gadgetry are to see immediate obsolescence, as though swept away in a tidal wave of replacement technology; electrical light switches, electric outlets, cable connectors and other such physical devices are disappearing. Amazingly, some artifacts presumed unchangeable without sacrifice of quality, such as orchestral instruments, will undergo sudden change to reemerge in new forms.

The mixed device-originated/musician-originated sound will improve and enhance the musician's skills and improve new opportunities for artistic education and expression. The whatchamacallit's possibilities for providing positive and enduring change are as endless and beautiful as may be the best of man's.

It's fascinating that as the whatchamacallit is taking shape in microland, mammoth macroland computer/communications systems are being developed. These Integrated Services Digital Networks (ISDN) are impersonal multipurpose things that will nourish and be nourished by our whatchamacallits.

The ISDN suggests the vision of a computer system so large it possesses electronic broadcast and cables "buses" to pipeline data swiftly coast to coast, while servicing massive clusters of systems en route — "transistors," warehouse-size lattices of high-voltage gear and "capacitors" office-building size. These further inspire a vision of America as a giant computer room, with corners in Seattle, Los Angeles, Miami and Boston. Vested in each ISDN may be the power of a billion personal computers.

Offers great promise

While this idea is knee weakening, the knowledge that these awe-inspiring titans will serve to nourish our little personal whatchamacallits — sending them their life's blood, data and converting this into every conceivable use — is beautiful and offers great promise for improving the quality of our lives. Access to the massive external facilities, with their enormous power and memory capacities, allows us to enjoy the powers that computer systems provide as mixtures of that possible within our whatchamacallit's local environment and that found in the ISDNs.

This will enable an optimized functional specificity of the two, while permitting superefficiency at the whatchamacallit. Whether in the home, in an industrial supercomputer cluster or anywhere in between, the variety of user-accessible on-premises equipment (that is, whatchamacallits) to emerge will be as unlimited as the inventive imagination.

For manufacturers, the business opportunities are spectacular. Like massive Christmas trees awaiting adornment, ISDN accoutrements will consume the efforts of engineers and scientists for decades to come. The result will be an endless bounty of customized whatchamacallits, decorated and illuminated by all manner of technological gadgetry, yielding gifts of electronic wonder.

Consider, for example, the possibility of the heretofore unimaginable luxury of a personal videostation, capable of communicating pictures, sound and text anywhere in the world — a personal National Aeronautics and Space Administration-like mission control for the orbit of your life.

Possessing all manner of sensing devices to obtain signals from alarm to video and anything in between, capable of processing these and displaying results in user-friendly media, the terminal of the decades ahead will provide users with creative opportunities of mind-boggling proportions.

The technically inclined will revel in the possibilities this kind of environment allows for tinkering, and the entertainment seeker will have his hedonistic wishes fulfilled and then some.

Imagine having your own personal whatchamacallit, providing such integrated services as may be currently obtained only through the nonintegrated facilities of such mammoth enterprises as AT&T, the Post Office, IBM, a secretarial service, a music/video recording studio and a TV/radio station — all in one room!

Distinctions vanishing

As today's personal computers receive expanded telecommunications capabilities and telephones develop further as microprocessors, distinctions between them are vanishing. Very soon we will call both by the generic name "terminal," thus downplaying their local attributes and stressing their global ISDN roles. Performance and function will qualify this name — fast, slow, data base, graphics and so on. Each will become a whatchamacallit or a component of one.

The benefits to be reaped by a carefully orchestrated plan that weds the needs of home/office whatchamacallit users to ISDN support are immeasurable.

Admittedly, the degree to which this can be achieved will become an important factor in determining which components to buy if we insist on putting it together ourselves.

Remembering the "build-your-own" hi-fi days with chagrined embarrassment, most of us will opt for someone else to integrate separately purchasable components.

The emerging sea of options, while confounding us in one sense, provides us with overriding benefits in another sense. It will allow us to apply better today's ever-expanding data processing power to our needs. The results will profoundly improve how we see, hear and speak to one another. Ultimately, they will change the way we think.

Lecht is chairman of Lecht Sciences, Inc., a New York-based think tank specializing in computer and communications technologies.

Micro user sets record straight

HUMAN CONNECTION
Jack Stone

Because it is impossible to send personal notes to the many respondents to my column, let me here thank you one and all for your thoughtful comments to my recent expressions of concern over the rank idiocy that is plaguing the microcomputer industry.

However, I have selected one letter that clearly deserves a public airing, partly because the reader is a more knowledgeable micro user than I think I am and partly because he is a more capable writer than he thinks he is. The letter was from Richard W. Hadley, vice-president of operations, Mount Auburn Savings Bank in Mount Auburn, Ind.

"I've been enjoying your columns for a number of years, but I can't let a few of your recent statements go unchallenged," Hadley said. "In particular, I take exception to portions of your articles "Confiscatability key to transporting micros overseas" [CW, Jan. 23] and "Where are the knowledgeable micro retailers?" [CW, Jan. 30].

"This letter is being written on an Osborne Computer Corp. Osborne 1 (01). Now I'll be the first to admit that the 01 (or any of the 'transportables') would not be much fun to carry on a 5-mile hike, but 'archaic'? Hardly! What is 'ancient,' 'old-fashioned' or 'hardly used' about a 64K-byte, 4 MHz Zilog, Inc. Z80 system? A large percentage of new systems, including the basic IBM Personal Computer, specs no better."

I admit that new systems are not that much better than the 01, particularly when benefits derived are measured against dollar outlays. And for students of creative writing, like myself, new machines with the so-called advanced word processing software actually offer me reduced capability when compared with my Processor Technology Sol 20/software configuration. My problem is one of semantics. Maybe "archaeological relic" is too strong an expression, but what do you term a way-out-of-production machine that still works for you — a quasi-leading-edge system or a fairly advanced technology-based machine?

'Most computer store personnel should spend their spare time reading systems manuals or trade journals rather then playing Zaxxon or watching Whiz Kids. *But let's not blame them for the absence of standards of compatibility where none exists.'* — Richard W. Hadley, vice-president of operations, Mount Auburn Savings Bank, Mount Auburn, Ind.

"Secondly," Hadley went on to say, "is the 5-in. screen any more ridiculous, particularly for word processing, than the displays on most of the lap portables? That's a matter of opinion at best, but I'd have jumped at the chance to get another 01 for $800."

No, 01's screen and the laps' LCDs are equally ridiculous for word processing, and if the 01 weighed in at 10 lb or less, I'd be first in line with the cash.

"I think you were distinctly unfair to at least one of the retailers you visited," Hadley said. "Most computer store personnel should spend their spare time reading systems manuals or trade journals rather then playing Zaxxon or watching *Whiz Kids*. But let's not blame them for the absence of standards of compatibility where none exists.

"You really didn't expect to be able to use the tapes from a new NEC Information Systems, Inc. lap portable on your Sol 20, did you? Good grief, if you've been using a micro for six years, you know better. We've

VIEWPOINT

How to motivate systems professionals

READER'S PLATFORM
Robert E. Manz

Data processing managers should spend more time understanding the efficiency characteristics and potential of their professional staff and attempt to maximize this valuable resource through proper motivation.

Historically, DP managers have not spent nearly as much time attempting to maximize the efficiency of professionals' activities as they have their equipment. In fact, DP managers will spend a great deal of time and effort in attempting to increase the efficiency of their computer equipment by 10%, 5% or even 3%, while spending more money on systems analysts' and programmers' salaries than on equipment.

The attempts that have been made in improving efficiency have been in the areas generally called "human engineering." The engineering approach attempts to find the most specific job content and appropriate incentive system to maximize the efficiency of the human machine. Jobs and tasks are analyzed, and more efficient methods of accomplishing such jobs and tasks, for example, structured programming, result. Actually, the greatest increase in output (quality and quantity) of analysts and programmers is, as for any professional, through motivation.

Equipment vs. personnel

Why would this be? Why would DP managers tend to spend more time analyzing the efficiency of the equipment rather than the efficiency of personnel, even though there are few greater savings to be realized in the latter area?

The answer to this question is not difficult to find. First, motivation is difficult to measure, and equipment efficiency is not. Second, the factors comprising equipment efficiency are easily understood, and those for motivation are not. Most DP managers come from a technical background and feel uncomfortable with and have little inclination for personnel management. The problem lies, then, in the managers, not the employees.

In terms of managing, motivating and maximizing efficiency in systems and programming personnel, there are two distinct problems: first, how to perceive an existing problem; and second, how to motivate personnel on an ongoing basis to achieve maximum efficiency.

In neither case are there hard-and-fast rules or equations to be laid down for use. There are, instead, only general guidelines that may be used in solving the two persistent problems.

The most obvious opportunity for motivational activities to be effective is to solve existing problems. The most difficult portion of this is, in fact, the perception that a problem exists.

Two types of information

In order to understand and to diagnose a problem correctly, there are two types of information available to the DP manager. These fall into the broad categories of structured and unstructured information. The DP manager should organize and routinize as much crucial information as possible so that it comes to him through formal routes, and he can monitor the activities for which he is responsible. Such items as turnover rates, grievances, weekly or periodic status reports and reports of supervisors should normally tell the DP manager when something is amiss.

These pieces of structured information are signal systems set up in advance to warn the manager when problems are about to or have occurred. The greatest practical danger in the systems is total reliance upon the pieces of structured information to the exclusion of other sources. In fact, much information may be gathered outside of the formal organizational structures, and such information is necessary.

The more frequent and more useful type of information is the unstructured. The principal source of unstructured information is the social system of the organization. Off-hand comments, conflicting reports, unexpected news and a general feeling that a problem exists should all point to a potential problem among workers. These will very frequently point to potential or future problems as well as existing problems.

Own frame of reference

The most difficult aspect of understanding the information available to the manager with respect to existing problems is cutting through his own frame of reference. Each person tends to organize available information into his own preexisting views. For the manager to understand properly the organization and the personnel with which he is dealing, he must first have an accurate insight into his own frame of reference.

The errors most frequently made in the area of understanding one's own frame of reference include:

- A tendency to evaluate rather than understand.
- A tendency to equate past experiences with current experiences.
- A tendency to use only available solutions, as opposed to thinking of new solutions.

The above framework should be helpful in assisting a manager in perceiving problems within his own organization. Once a motivational problem has been found and correctly diagnosed, the following guidelines should be useful in maximizing the potential of employees.

For quite some time now behavioral scientists have been distinguishing between negative and positive motivation. Most managers, per-

Need general accounting software for IBM System/38?

We've simply solved your problem.

LAWSON ASSOCIATES has solved it with the first general accounting software specifically designed for IBM System/38. Not merely compatible, but state-of-the-art to fully utilize your computer's capabilities. Compare. You won't find a total software solution like it anywhere else.

DESIGN FEATURES: They include: on line systems using data base management; menu driven, user friendly programs written in RPGIII, the System/38 language; and integrated modules. Their benefits: ease of installation and use, plus maximum employee productivity.

INTEGRATED MODULES: Those available include: General Ledger and Report Writer/Accounts Payable/Accounts Receivable/Fixed Assets/Payroll/Personnel/Purchase Order/Order Entry/Inventory Control

SERVICE FEATURES: Fully documented and supported. Onsite training and implementation. One year warranty. Available now for immediate installation.

For more information, please call or write:

Implementing the information center concept: One

READER'S PLATFORM
Naomi Karten

Many people still do not agree on whether the information center is a concept, a place, a function or some combination of these. Therefore, it is not surprising that although most information centers have the same basic objective of improving user productivity through user-oriented hardware and software, the manner in which this objective is implemented varies widely.

Awareness of the many variations may be helpful to information center planners, particularly in allaying any concerns about whether they are going about it right.

In some companies, for example, the information center's sole responsibility is training and support of users in the use of fourth-generation languages. In other companies, information center staff also perform product evaluation, selection, acquisition and implementation of end-user products.

Some information centers develop and provide all training themselves. Others call in vendors or professional trainers to provide training in end-user software and/or call upon DP training staff to provide instruction in computer fundamentals.

Some information centers support purchased software only, while others also develop their own software in response to identified user needs. Some information centers depend on other DP areas to perform such tasks as file extracts, data base creation and Job Control Language setup for the information center. Other information centers perform all such terminal work themselves, up to and including the enhancement of supported products with customized user interfaces.

No programming for users

Whether or not they undertake the setup of the information center technical environment, some information centers do not perform programming for users, placing the burden of responsibility on users to learn and use available products.

Other information centers, in addition to providing training, program in response to user's ad hoc requests as a means of supporting management's needs for rapid access to computerized information.

In some companies, personal computers — and the full range of responsibilities that the acquisition and management of personal computers entails — are an integral information center function. In other companies, personal computers are managed as a separate and distinct responsibility, while in others, the decision is made (or not made) to leave the purchase and use of the personal computers to the individual users.

Some information centers that manage personal computers strictly control the personal computer software users may acquire. Others do not place any restrictions on users acquiring the software of their choice, but limit support to only selected software.

In some companies — probably most — the information center is part of the data processing organization, and all members are hired by and responsible to data processing. In other companies, the information center is somewhere between data processing and the user, with representatives from both areas involved.

In spite of the variations, certain common themes emerge: user support, user independence, quick access to information, productivity and decision support all pervade any discussion of the mission of the information center regardless of the specific method of implementation.

These differences in style

VIEWPOINT

approach not necessarily better than another

and approach are exciting because they demonstrate the many ways that companies have chosen to accomplish the same basic objective.

Benefits and risks

To be sure, there are benefits and risks to each of these approaches, as some of the more mature information centers (those in operation two years or longer) are finding out. Consider the technically oriented vs. nontechnically oriented information center staff.

Nontechnically oriented staff are often at the mercy of their technical support areas to keep the technical pieces in place, for example, installation of new product releases, resolution of software bugs, timely creation or update of user data bases. Being nontechnical, and to some extent not conversant in the stuff of technical problems, they can become caught between the demands of their users and the delays (whether valid or not) of their technical support areas. However, as a nontechnical area, this type of information center, by definition, has a ready explanation for not getting caught up in supporting the technical needs of its users and can, therefore, devote full attention to training and support.

The technically oriented information center, on the other hand, usually consists of people with both technical and training skills. The people generally have DP training and/or experience prior to joining the information center, and they want to do technical things. They can solve most technical problems that arise in the use of the supported software, with minimal reliance on other DP areas.

Having the technical skills to solve the data access needs of their users, these people may face the temptation to do so rather than invest the time in training their users — an instance of the "I can do it faster myself" syndrome. Their users, at the same time, quickly become aware that these are technical folks, and the scope of the resulting requests for support tends to extend far beyond that of the nontechnical information center.

One better than other?

Is either approach to the information center better than the other? From my comparisons with managers and staff from other information centers, I would say no.

Both types have problems, but both types have had major successes in providing end users with reduced dependence on application development departments and increased independence in satisfying their data access, manipulation and reporting needs.

Most importantly, perhaps, there does not seem to be anything inherent in any implementation of the information center concept, structure or technology that would prevent an information center from evolving from its current user support methodology to any other methodology. Recognition of the many alternative paths is the key. ‡

Karten is information center manager at Blue Cross Blue Shield of Massachusetts in Boston.

USER from page 51

never had a true tape standard. You're an engineer. If you want to tackle a hardware problem like that, fine, but why blame some poor store clerk who undoubtedly had never heard of a Sol 20?

"You even found one salesman who was willing to try the improbable. That should have been worth a column of praise, not a hatchet job."

Yes, I was an engineer until I found early on that my competency level was so absurdly low that teaching — and writing — was more appropriate. As a result, the prospect of installing public domain software on my Mediterranean-blue-paneled, mahogany-trimmed Sol 20 Professional Computer to support a lap job was so horrendous that I turned to the remote possibility of tape compatibility as a saving feature. I never asked the salesmen to do any more than copy a file from the NEC to the tape machine, using standard NEC commands. This they couldn't do, and even though I thrive on reading technical documentation, NEC's write-up didn't match NEC operations, and I couldn't make the copy, either.

"Your column is being read by a lot of MIS types who have apparently been studiously ignoring microcomputers for the past six or seven years, hoping they would go away. Now they're being dragged, kicking and screaming, into the real world by the users.

"Maybe those of us who have been in the micro vanguard could be of more service to those poor souls by being a little more selective about where we do our complaining. We don't need to give the MIS Luddites any more ammunition than necessary.

"I guess what it boils down to is this: I agree with most of your basic premises, but I think your examples were ill-chosen.

"My final advice? Go back and buy the used Osborne 1. After all, it was designed by the same man that designed your Sol 20. I'll even give you a disk full of communications software so that you can trade data files with your Sol. Then go on to Mexico, and enjoy yourself. You can always tell the customs folks that it's a sewing machine."

Didn't know of the Sol/01 connection. May have to re-evaluate the 01 afterall, particularly if it can thread a bobbin in less than two seconds. ‡

MOTIVATE from page 52

ticularly those with a technical orientation, are oriented toward negative motivators. These are company policy, administration, supervision, working conditions, salary, relationships within the group and security. These factors are generally called "hygiene factors."

Positive factors

Positive factors are called "motivators." These are achievement, recognition, work content, responsibility, advancement and growth.

An important difference between the two general classifications is that the hygiene factors relate to job dissatisfaction and the motivators relate to job satisfaction. If any of the hygiene factors is not satisfactory to the employee, he will be dissatisfied with his job. However, if they are all satisfactory, it is not the case that he will be content with his job or that he will perform to his maximum potential.

On the other hand, if all of the motivator factors are satisfactory to the employee, he will be satisfied with his job. If they are not, he will perform only the expected or minimum requirements of his job.

The goal of managing professional employees should be to promote their efficiency to the maximum level. The way to do this is to increase their motivation as far as possible. If problems have been recognized in this area, fine; if not, an attempt should be made to maximize motivation in any case, because it would seldom naturally occur.

By distinguishing between the two broad characteristics, it should be recognized that simply meeting salary demands and the like will only keep the person on the job, but will never begin to maximize his efficiency.

A great deal more effort is necessary in achieving the other six general motivators in order to increase the efficiency of the employee. These are more important for professional-level employees because of their background, the nature of their work, the possibilities of meeting those requirements and the salary levels and costs involved.

In trying to maximize the motivators, there are many factors that must be considered. Generally, these come under the label "job enrichment." That is, a job should be designed to have the employee meet each of the six motivators. It should be recognized that motivators should be used for producing long-term effects on employees. By having employees participate in job redesign to increase their satisfaction, only short-term movement will result. Unless the basic natures of the jobs are changed, only a temporary sense of movement will occur.

Some of the most common pitfalls of such redesign include:

- Thinking that the content of a job is fixed.
- Thinking that employee participation is necessary to improve motivation.
- A confusion of the motivators and the hygiene factors.
- Simply increasing the volume of work.
- The belief that once a job is changed, no monitoring or further action is necessary. ‡

ATS introduces MASTERKEY.

The ultimate way to unlock the mysteries.

If you're a DP Manager, you know that when it comes to unlocking the mysteries of the IBM® PC for your people, you couldn't ask for a more brilliant source than ATS.
(After all, who has more experience than we do? We've been unlocking the mysteries of computers for more than a decade.)
MASTERKEY establishes a whole new standard of tutorial excellence. Certainly, there are other good IBM PC teaching courses out there. Yet none combines in one package, the dazzling clarity, the building block by building block simplicity, the sweeping, comprehensive range of MASTERKEY.
Consider just a few of its advantages:
MASTERKEY makes learning a snap for anyone. It requires no previous training whatsoever — even for those who seem to have the least aptitude. In astonishingly little time, MASTERKEY will give them a solid grasp of the IBM PC. It does this through an extraordinary combination of powerful graphics, animation and sound. MASTERKEY also boasts another innovation: an interactive but separate audio cassette. This unique concept allows students to pace themselves with far greater ease, thereby making comprehension practically effortless.
Unlike virtually every other course, MASTERKEY doesn't content itself with just teaching the keyboard and the operating system. It goes well beyond that. Students are introduced to word processing, communications networks, business graphics and spreadsheets.
MASTERKEY leaves nothing unexplored. It offers full instruction on how to use the IBM PC as a smart terminal, and how to access, retrieve and store information from S/34-38. It even advises you on what additional software you may need.
As you can see, MASTERKEY is a tool of incalculable value. It enables you and your data processing department to take firm control over all data processing functions.
Sound good?

Package solution: buy *and* make

The "make or buy" question of applications software continues to be raised by managers who are short on staff and long on user requests. Quite often, companies with a flexible attitude have been able to acquire packages such as general ledger, payroll, accounts payable and accounts receivable and implement them unchanged.

But more often than not, a package is rejected because it does not provide every feature desired or because it requires some modification or conversion effort to implement.

Because of the ever-increasing demand for applications, coupled with limited development staff size and experience, the question of make or buy must be reconsidered to include the option of "buy and make." In other words, the quickest alternative for meeting a user's needs may be to acquire a package that offers most of the capabilities required and use the in-house staff to customize, supplement and implement the product.

How do you go about determining if there are software products available that could be considered for a unique or industry-specific application? You might want to start with your mainframe vendor representative, who could use channels within the vendor organization to locate such software. Trade publications carry advertisements of vendors and their offerings. Industry conferences and exhibits often include a presentation of papers or demonstration booths informing attendees of software packages. Directories or catalogs are available by mail or even on the newsstand. Consultants can often direct you to qualified products or suppliers. The best source may be the contacts you have in your own industry.

See PACKAGES page 98

Shopping for security?

Look for accountability, integrity, auditability

By Vic Swan
Special to CW

The publicity fire storm over the movie *War Games* and the escapades of real-life hackers have many data processing managers running for cover. But shopping for computer security is no easy task.

The first step in selecting security software is to decide exactly what is to be protected. After defining the specific needs of the company and considering the high cost of even one security loss, it might be helpful to keep the following list of questions handy when approaching a security software vendor.

Is the security by exception or default? The security-by-exception philosophy proposes that if the data is to be protected, you have to identify what is sensitive, take the necessary protective action and define who can access that data. This is the list-oriented philosophy and requires considerable administrative effort to maintain the lists as users come and go.

The default system allows growth without undue administrative overhead. It involves perhaps more preplanning, . . . but the time is well spent in the long run.

For fairly small organizations with a homogeneous community of users, exception might be the more viable approach as the initial installment is often comparatively simple.

The default system allows growth without undue administrative overhead. Driven by algorithmic specifications, it involves perhaps more preplanning and more front-end thinking, but the time is well spent in the long run.

Once the default system is implemented, all data is secure unless explicitly designated otherwise. Users are grouped together by the security system, based on a particular category, or a group of categories as the company chooses.

Can the system be bypassed? In some systems, security officers have access to a list of passwords that allows them to gain access to the user's data. The problem is that a user could always point the finger at the security officer if a security exposure occurs. There is no individual accountability in such a system.

In other security systems, security officers do not have access to the users' passwords. If the user loses his password, he cannot gain access until the new password is changed to another password, which the security officer does not know and which is encrypted in storage. No finger pointing can occur in this case.

Even if the security officer attempted to bypass the system by pretending a user lost his password, the user could find out. A good auditing feature is of utmost importance in a default security system.

Can individuals be held accountable for their actions? If a physical list of passwords exists in a list or in a file folder in a storage facility, security is seriously threatened. There would be no way of knowing for certain who gained unauthorized access.

It is important to make sure a system does not flash the password on a user's terminal when the user types it in. One-way encrypted passwords that cannot be decoded and are stored in the software seem to be the most desirable.

Does the operating system offer guaranteed integrity? If so, security by default cannot be bypassed. Security by exception can. Newly created resources may be unprotected simply because no one knows of their existence, and no one has yet found time to protect the "ones they feel need protection."

Does it have auditability? Most systems have an emergency bypass system. The important consideration is to make sure that all uses of the emergency bypass can be audited.

A security officer should not be able to gain access without identifying himself. In an ideal system, auditability must exist on the following levels: individual user, resource, administrative/security officers and the security system itself.

Is data security dependent on Format 1 Data Set Control Block? If the answer is

Buyers warned of software promotion hype

By Paul Korzeniowski
CW Staff

BOSTON — "When evaluating software this year, *caveat emptor* — let the buyer beware," said Janice Antonellis, research manager at International Data Corp. (IDC), at IDC's 19th Annual Industry Briefing Session, held at the Copley Plaza here recently.

"There is a lot of hype and a great deal of money being paid to create images which may or may not be true. Promises are being made by software manufacturers. Users should realize that many of the interesting programs are not scheduled to be shipped until the fourth quarter of this year," she said.

Fierce competition is forcing software companies to spend large sums of money to promote a product, Antonellis said. Money and marketing are becoming major factors in determining a product's success. "Every company is trying to elevate itself above the clutter, noise and crowd. Mitch Kapor [president of Lotus Development Corp.] said that it took $3 million to market Lotus 1-2-3 last year. He said it would take $5 million today."

To ensure that they can compete, software companies are branching out from traditional markets and into new product areas. "Software companies are diversifying so that they will not be just a one-product shop," Antonellis said. "They are trying to maximize their current customer base and extend their traditional customer base."

Management Science America, Inc. (MSA) has added microcomputer products, productivity tools and data base management systems to its accounting software. Cullinet Software, Inc. has shifted from just selling data base management to developing financial application software as well, she pointed out.

Another method to generate revenue is consolidation and acquisition. Acquisition fever is sweeping the industry as mainframe companies acquire microcomputer companies, microcomputer companies buy microcomputer companies and noncomputer companies purchase computer companies, Antonellis said.

Partnerships allow companies to share costs without relinquishing corporate control. This year, for instance, Lotus teamed up with Dun & Bradstreet Corp., McCormack & Dodge Corp., MSA, Management Decision Systems, Inc. and Digital Equipment Corp. in an effort to distribute 1-2-3.

As the ante is raised, the ultimate winner will be the user. "We are a long way from having truly user-friendly software," Antonellis said. "But user-friendliness will have center stage as long as competition remains keen."

Nixdorf, IBM CPUs get CICS generator

RICHMOND, Va. — Nixdorf Computer Corp. has announced an application development system that it said will generate complete Cobol/CICS applications on IBM and Nixdorf mainframes.

According to a spokesman, Nixdorf's Hibol generates 100% of the code required for Cobol/CICS programs once a user has input simple, structured specifications.

The spokesman also said program debugging time is reduced by as much as 80% because Hibol produces error-free, modular Cobol source code.

Hibol reportedly generates documentation from information extracted from the data dictionary and application programs, screen layouts, reports and data element descriptions.

The system is said to provide Cobol source code portability. Hibol programs in source code can be transported, compiled and executed on any compatible mainframe with or without Hibol.

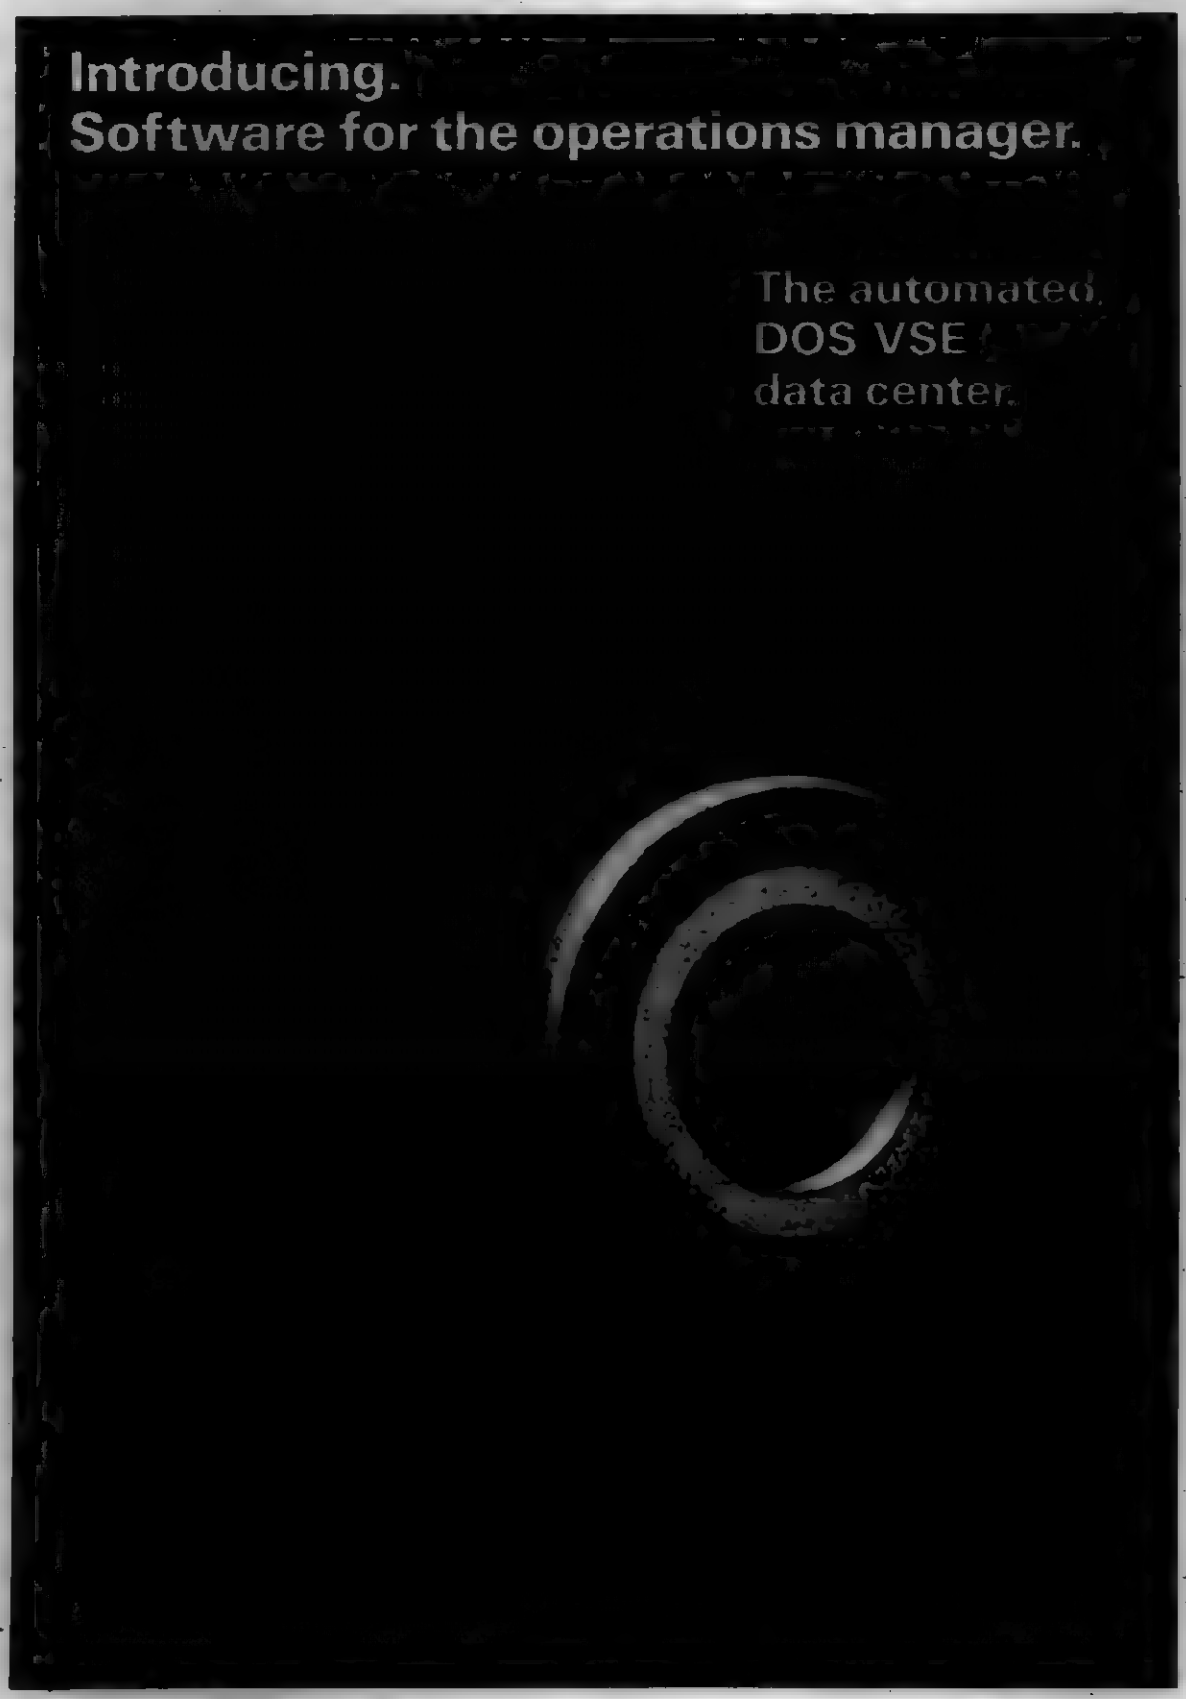
With Hibol, the spokesman said, CICS application menus can be created independently, with no programming involved. The system's menu function generates all code necessary to display the menu and to select the appropriate function.

In an on-line environment, Hibol also allows users to generate or access multiple files or records per screen and can handle multiple screens per program.

Hibol runs under IBM's CICS/VS in DOS/VSE, Edos/VSE and OS operating systems on Nixdorf's 8890 processors, IBM's 370, 4900 series, 30 series and other compatible systems.

A single-license fee for Hibol is priced at $20,000, and 12- or 24-month leasing plans are also available. The 12-month lease costs $870 per month, and the 24-month lease costs $765 per month.

More information is available from Nixdorf at 6517 Everglades Drive, Richmond, Va. 23225.



DEC announces RPG-II language for VAX-11s

MAYNARD, Mass. — Digital Equipment Corp. has announced a new RPG-II language for its VAX-11 series of processors.

The VAX RPG-II language is intended primarily for commercial applications requiring frequent report generation and ongoing file maintenance and for educational institutions training students in business programming, a spokesman said.

A native-mode language running under DEC's VMS operating system, the VAX RPG-II language is integrated into the VAX common language environment. That enables VAX RPG-II programs to call modules written in other VAX-11 languages as well as many VMS runtime library routines and VMS system services, DEC said.

VAX RPG-II also uses the VAX Record Management Service, which is said to provide mutual shared access to files by programs written in VAX RPG-II and other VAX-11 languages. DEC said the new language product consists of a compiler capable of speeds of approximately 3,000 line/min, an editor tailored to the columnar structure of the language and runtime support.

The VAX RPG-II compiler, editor and runtime component are included in the license fee of $3,000. The language is scheduled for delivery in April from DEC, Maynard, Mass. 01754.

File manager from Dylakor fits IBM CPUs

Dylakor, Inc. has announced DYL-280 II, a file and information management package for IBM mainframes.

The product features a full-function report writer, label and letter generation, linear regression capabilities, table and array handling and in-stream Cobol data definition support, the vendor said.

Dylakor's letter writing facility reportedly allows users to combine standard text with variable data from any input file.

Interval selection and random selection can generate test data, select certain records for mailing lists and collect records for data analysis, the vendor said.

Utility commands can retrieve and analyze System Management Facilities records, print in hexadecimal, convert Ascii data to Ebcdic data and retrieve and insert data into DOS communications job regions, the vendor said.

A single-CPU license for DYL-280 II costs $12,200. The system runs under IBM's DOS and OS operating systems.

More information is available from Dylakor at 17418 Chatsworth St., P.O. Box 9010, Granada Hills, Calif. 91344.

More and more, personal computers in large organizations are dramatically improving productivity. But there's also a problem involved with this improvement. People are using many different, often incompatible microcomputers, yet they still need to share information, programs, and peripherals.

It's as if everyone had an automobile, but no highways leading to their destination. No traffic signs to follow. No rules of the road. The result? Mass confusion.

Until now, that is. Until Liaison from SofTech Microsystems.

Based on the p-System,™ Liaison is a family of network software products that lets you establish a workable, efficient personal computer network. It allows personal computers and users to co-operate and work together so that your organization is altogether more effective. Liaison includes systems software products, such as an operating system, print servers and disk servers as well as development tools, including Insight Window Designer,™ a complete "window" development environment. And, a collection of network applications, including a database management package, electronic mail, and more.

Liaison lets you unite many different personal computers in an effective network. 8 and 16-bit machines from virtually all personal computer manufacturers (including IBM,® TI,® Corvus,® Apple,® and Sage™) can all share programs, all work together, all co-operate.

So if you're tired of your different personal computers driving you to the brink of insanity, give us a call at SofTech Microsystems.

We'll show you how Liaison can get you back on the road to recovery.

SOFTWARE & SERVICES

SYSTEMS SOFTWARE

SYSTEM SUPPORT SOFTWARE, INC.
Quikjob III Release 13.0

System Support Software, Inc. (SSS) has introduced a new version of its Quikjob III featuring native IBM Vsam support.

Quikjob verbs included in the release reportedly provide access to all three types of Vsam data sets. Vsam random access, sequential access and updating are all accomplished without coding subroutines, the vendor said.

Also included is a program that will print a hard-copy screen image of a Basic Mapping System map and the map name from the assembled object code.

Quikjob was designed to run on all IBM mainframes and operating systems. Release 13.0 will be distributed free to all current Quikjob III users. It is priced at $5,445 or can be leased for $125/mo, a spokesman said.

SSS, 5230 Springboro Pike, Dayton, Ohio 45439.

DELPHI DATA SYSTEMS, INC.
DD-Project

Delphi Data Systems, Inc. has introduced DD-Project, a project scheduling system that operates on IBM mainframe computers running under CICS.

According to the vendor, the system can be used to identify project schedule and staff capacity problems through both detail and exception reporting. The information provided by the system can be selected by the user, providing as much or as little detail as desired.

The perpetual lease price of the system is $4,000. A yearly and monthly lease plan, training and system maintenance are also available.

Delphi Data Systems, 9905 Hamilton Road, Eden Prairie, Minn. 55344.

HAWKEYE INFORMATION SYSTEMS, INC.
Pathfinder/38

Hawkeye Information Systems, Inc. has announced Pathfinder/38, software for the IBM System/38 that provides interactive or batch analysis of objects.

The vendor said the first module points out objects that can be deleted, while the second module points out duplicate logical views.

Pathfinder/38 is a menu-driven, command-driven documentation system that provides job stream explosions. It shows all control transfers from one program to another and supports all IBM commands.

The one-time license fee is $1,400. Users are supplied with documentation.

Hawkeye Information Systems, Suite 108, 14853 Delano, Van Nuys, Calif. 91401.

COMPUWARE CORP.
Abend-AID/CICS

Compuware Corp. has announced Abend-AID/CICS, a software product for the IBM OS/CICS environment that analyzes the cause of CICS transaction abends and provides the programmer with on-line diagnostics.

The software can be used in both test and production regions. Transaction abends will be diagnosed in each region, allowing programmers to resolve problems on-line, the vendor said. Prices for the software range from $5,500 to $13,000.

Compuware, 32100 Telegraph, Birmingham, Mich. 48010.

BOOLE & BABBAGE, INC.
IMF/MSS, IMF/SM

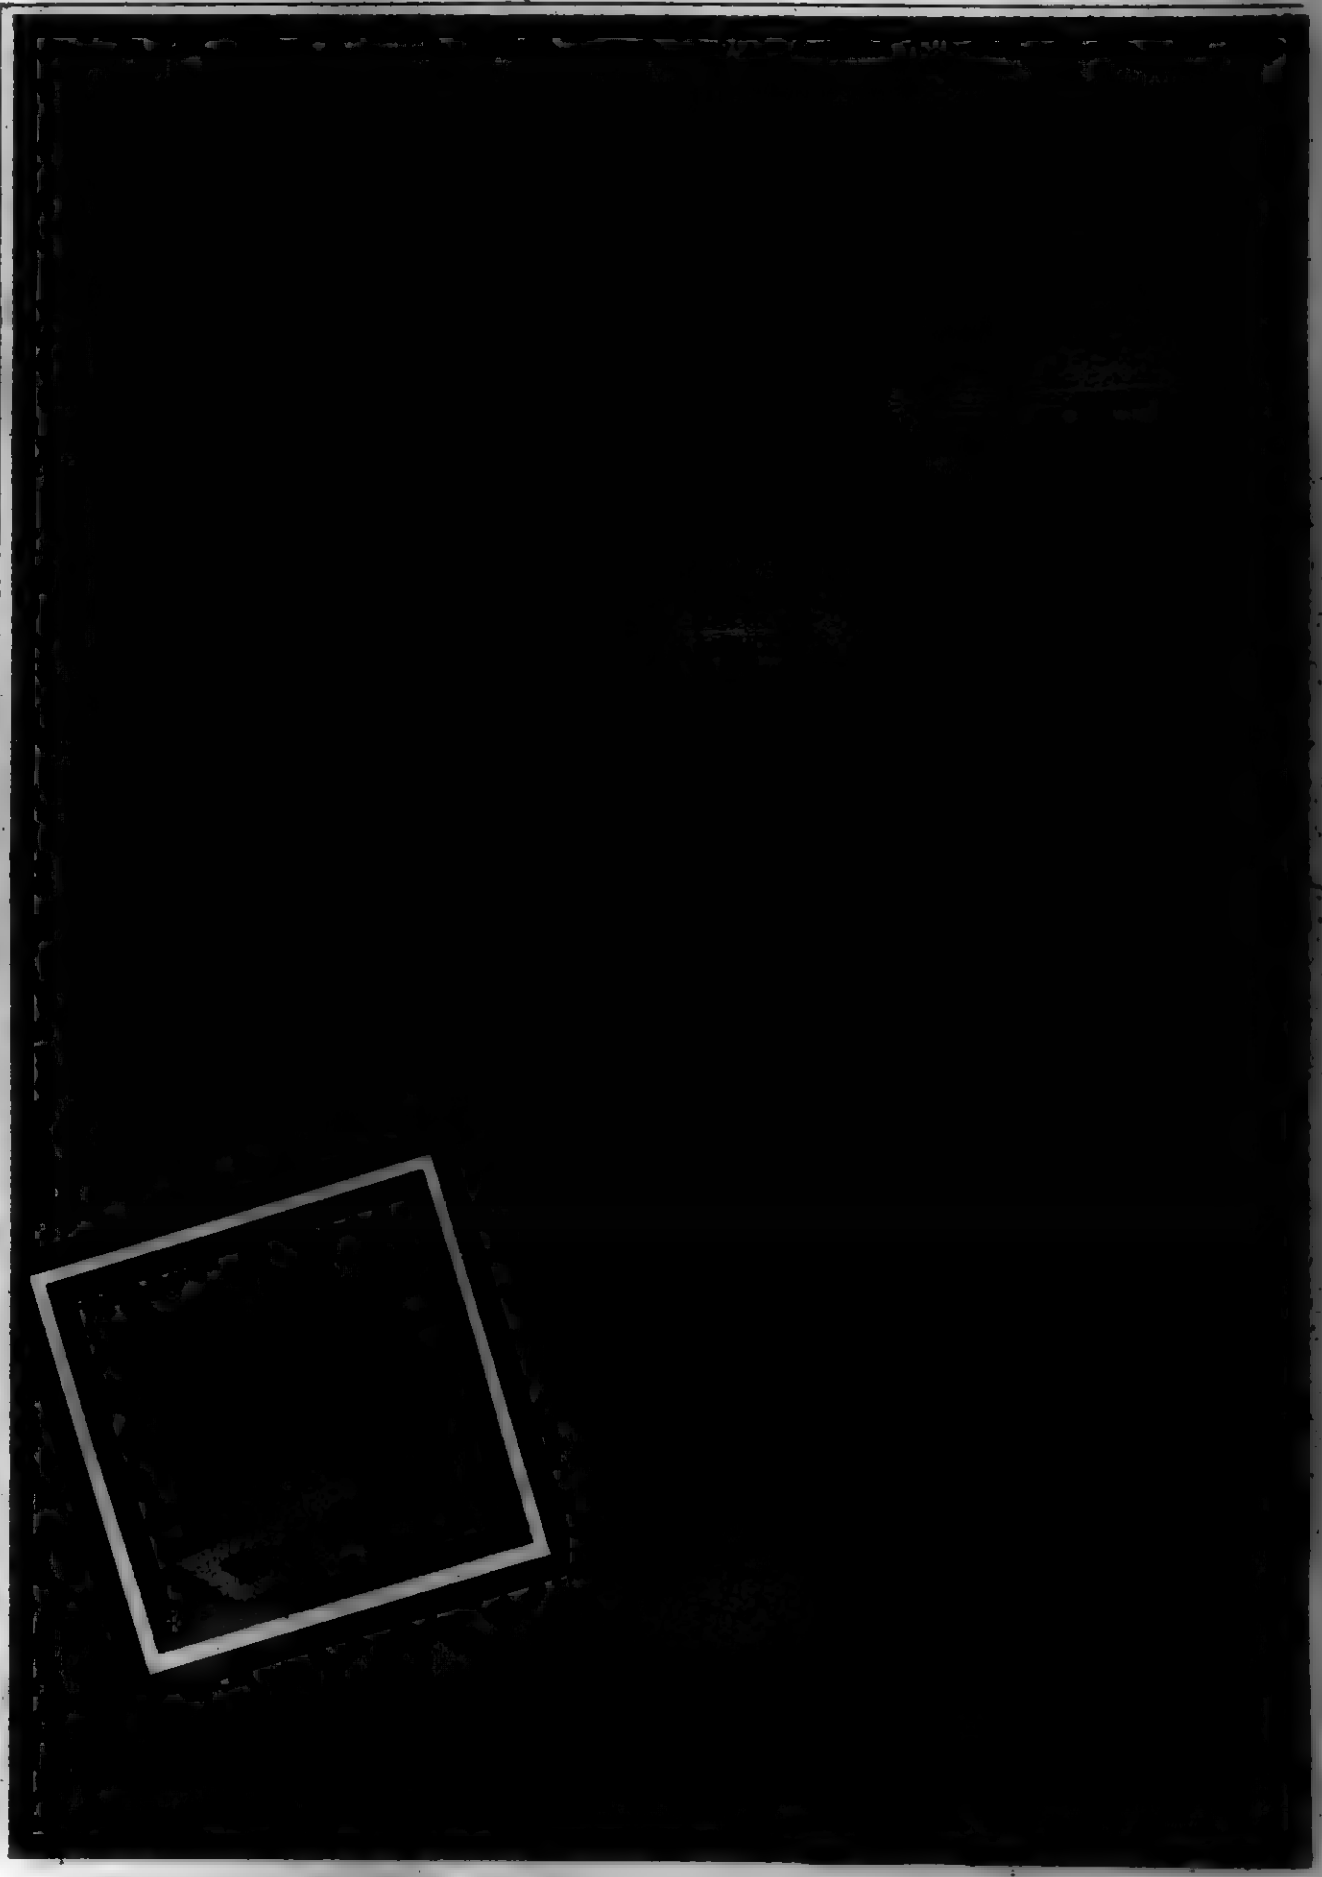
Boole & Babbage, Inc. has announced the addition of IMF/Multiple Systems Support (IMF/MSS) to its IMS Management Facilities (IMF).

IMF software, according to a spokesman, provides performance monitoring and management for IBM's IMS data base management system under IBM's MVS operating system.

With IMF/MSS, the spokesman said, users can diagnose problems and manage performance and operation of a distributed IMS network from a single location. Multiple MVS systems, even if geographically dispersed, reportedly can be managed from a single IMF terminal session.

The IMF/System Manager (IMF/SM) is an on-line program designed to improve

Continued on page 94



SOFTWARE & SERVICES

Continued from page 63.

IMS service. Using scrollable panel displays, IMF/SM is said to offer IMS master terminal operators capabilities that are similar to those that IBM's SPF provides for IBM TSO users.

The spokesman said IMF/SM can automatically start, stop or reassign IMS resources.

IMF/MSS licenses for $23,000, and IMF/SM licenses for $28,500.

Boole & Babbage, World Headquarters, 510 Oakmead Pkwy., Sunnyvale, Calif. 94086.

PRODUCTIVITY AIDS

DATA GENERAL CORP.
SGU enhancement

Data General Corp. has enhanced its Screen Generator Utility (SGU) to interface with five additional languages: APL, C, Fortran 77, Pascal and PL/I.

The user interface for the SGU is the same for all supported languages and protocols, a spokeswoman said. SGU's built-in features include function-key entry, on-line Help facility and default responses for most SGU questions. It runs on DG's Eclipse information system with AOS or AOS/VS and on DG's Desktop Generation series with AOS/VS. The user interface is identical under all operating systems, the vendor said.

Initial license fee for SGU under AOS/VS is $3,000. The fee is $1,500 under AOS; $800 for an upgrade from AOS.

DG, 4400 Computer Drive, Westboro, Mass. 01581.

PERTEC COMPUTER CORP.
System Builder enhancement

Pertec Computer Corp. has announced that it will bundle an enhanced version of its System Builder application generator with current models of its Sabre line of processors under Pick & Associates, Inc.'s Pick operating system.

The enhanced System Builder is said to be completely menu driven and allows users with no programming experience to develop, customize and document applications, the vendor said.

The enhanced version of System Builder is only available as part of the software bundled with the firm's line of Sabre computers. Prices for computers within the Sabre line begin at $9,500.

Pertec Computer, 17118 Armstrong Ave., Irvine, Calif. 92718.

CINCOM SYSTEMS, INC.
Scenario

Cincom Systems, Inc. has released a step-by-step programming aid for application prototyping as an optional feature of Mantis, its fourth-generation application development system.

With Scenario, a user reportedly can define the system flow during the design phase of an application and see the hierarchy of the screen-to-screen flow within the application. Users can then demonstrate the defined scenario as if the application had been implemented, a spokesman said. Scenario can also be used to transform a completed design into a production application.

An optional feature to Mantis Release 3.7, Scenario is priced at a single-use charge of $7,500. The annual renewal charge is $975; a one-year monthly license charge is $312, and the installation charge is $750.

Cincom, 2300 Montana Ave., Cincinnati, Ohio 45211.

APPLICATION PACKAGES

COLLIER-JACKSON, INC.
CJ/Personnel

Collier-Jackson, Inc. has announced that its CJ/Personnel personnel processing and reporting package is now available for use with Digital Equipment Corp.'s VAX-11 series of 32-bit minicomputers.

The system is a data-base-oriented, on-line, menu-driven package. CJ/Personnel features application listings, employee status notices, attendance benefit statements, federal Occupational Safety and Health Administration and Equal Employment Opportunity reports and employee transfer reports.

CJ/Personnel is licensed for $24,000.

Collier-Jackson, 3705 Jetton Ave., Tampa, Fla. 33629.

THE MEGA GROUP, INC.
Megagraph

The Mega Group, Inc. has announced Megagraph, a graphing system designed for IBM mainframe users in the MVS/TSO and VM/CMS operating environments.

The mainframe graphing system is interactive with Megacalc, the company's electronic spreadsheet. The system allows users to picture or print all data created with Megacalc in full color. Using Megagraph, all Megacalc data can be graphed into eight types of graphs, the vendor said.

Prices range from $2,500 to $4,000.

The Mega Group, 17701 Mitchell Ave. N., Irvine, Calif. 92714.

WILSON GROUP, INC.
Customer System Product

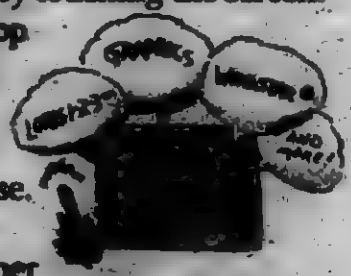
Wilson Group, Inc. has announced a software package that reportedly enables utility companies to automate customer records using an IBM 4341 computer.

Is your office operating at a crawl...

HP 150

Maybe the one thing you need to get off the ground is the Touchscreen Personal Computer. The HEWLETT-PACKARD 150. Because it's no ordinary machine. Remember the first time you approached a personal computer? If it wasn't exactly love at first sight, it was probably because a lot of machines can be pretty intimidating. Especially for first-time users. We've made the Touchscreen Personal Computer so easy to use that people like to use it. Very simply, we've taken out the intimidation factor. We've made the new Touchscreen Personal Computer so easy to operate that even first-time users can use it. Which means they'll quickly grow to love it.

For example, to select the software you want to use, just touch the screen. So whether you want to work with words, numbers or graphics, all you have to do to get started, is touch the screen. And once you get going, you can change a number in a spreadsheet, or make a chart for a presentation just by touching the screen. No complicated commands to remember. No desktop gadgets to manipulate. All that's required is the touch of your finger. MultiPlan,™ Graphics, WordStar,® Lotus 1-2-3,™ dBase II,™ VisiCalc® and a world of popular software become easier than ever to use.



The Touchscreen Personal Computer not only communicates with people. It communicates with other computers, too. Your people are your most valuable asset. But the more information they have at their fingertips, the more valuable they become. The Touchscreen Personal Computer delivers again.

SOFTWARE & SERVICES

Called the Customer System Product, the software was developed by the Iowa Public Service Co. The software reportedly supports customer service functions such as service meter installation and reading, customer information, order entry, billing, deposits, credit, collection, customer accounting, revenue accounting and service calls.

The package can be purchased for $340,000 and is available now.

Wilson Group, 333 N. Michigan Ave., Chicago, Ill. 60601.

COMPUTER RESOURCES, INC.
Projectalert modules

Computer Resources, Inc. (CRI) has added six modules to Projectalert, a menu-driven project management system that runs on Hewlett-Packard Co. HP 3000 systems.

Cost and Labor Tracking ($6,000) provides an interactive system that tracks project costs and hours against budgets, the vendor said. Alert Problem Reports ($3,000) produces exception reports that list costs or schedules which vary from original estimates. Resource Leveling ($3,000) reportedly optimizes project resource requirements and eliminates unmanageable variations in work force utilization. Micro Scheduling ($3,000) produces schedules in hourly increments. Report Organizer ($2,000) groups and produces a large number of reports, the vendor said. Activity On-Node ($2,000) allows data to be tied into a network, according to the vendor.

CRI, 5333 Betsy Ross Drive, Santa Clara, Calif. 95054.

SYSTEM SOFTWARE ASSOCIATES, INC.
BPCS Distribution

System Software Associates, Inc. has announced that its distribution application software is available for IBM System/38 computers.

Business Planning and Control System (BPCS) Distribution is one of five packages in the vendor's BPCS. The package reportedly contains features to handle multiple locations within multiple warehouses, contract and discount pricing, credit analysis, multiple companies and profit centers, taxes and sales analysis. Modules include inventory management, customer order processing, billing, sales analysis and purchasing, a spokesman said.

The program is written in RPG-III and is priced at $30,000, including source code and documentation.

System Software Associates, Suite 3620, 500 W. Madison, Chicago, Ill. 60606.

DATA BASE MANAGEMENT SERVICES

TRANSTIME TECHNOLOGIES CORP.
Datamat

Transtime Technologies Corp. has introduced Datamat, a dictionary-driven, multiuser, integrated relational data base management system.

Datamat includes bar charts and scatter plots, math functions, statistics, forms generation and text processing with a built-in interface for other word processors.

Datamat is available on a variety of operating systems and processors, including Unix; IBM's PC-DOS; Microsoft, Inc.'s MS-DOS; Zenith Data Systems Corp.'s Z-DOS; Digital Research, Inc.'s CP/M and MP/M; and Digital Equipment Corp.'s RSX and VMS. It is offered on 56K bytes of random-access memory (RAM) using Zilog, Inc.'s Z80 and Z80A microprocessor or Intel Corp.'s 8080 and 8085; Datamat is also available on 128K bytes of RAM using Intel 8086 or 8088, Motorola, Inc. 68000 and DEC PDP-11 and VAX-11 processors.

The price for Datamat ranges from $200 to $1,000.

Transtime Technologies, 797 Sheridan Drive, Tonawanda, N.Y. 14150.

WANG LABORATORIES, INC.
VS Task

Wang Laboratories, Inc., in cooperation with Cincom Systems, Inc., has announced VS Task, an interactive query and report facility for use with Cincom's Total Version 2 data base management system on Wang VS system products.

The on-line query facility reportedly provides a direct method of retrieving and reporting on information stored in Wang Total data base files. VS Task consists of a query module, through which information is retrieved, and a directory maintenance module.

Other features include a nonprocedural language, English-like syntax and on-line Help messages. VS Task requires a minimum of 256K bytes of memory and about 800K bytes of disk space. It is priced at $10,000.

Wang, 1 Industrial Ave., Lowell, Mass. 01851.

REMOTE COMPUTING SERVICES

MONCHIK-WEBER CORP.
Quote Service

Monchik-Weber Corp. has introduced a real-time pricing service called Quote Service for common stocks, stock options, debt options, index options, financial futures, commodities futures and currency futures and options.

Quote Service is available on the Tymnet, Inc. data base system to micro users with modems for $250/mo, plus $20/hour connect time. It may

Continued on page 86

when it could be flying?

communication

The HP 150 is fully compatible with the big HP 3000 computers and, with the addition of our new 3278 communications capability, the 150 can talk to IBM® mainframes as well. Your people can call up data, work with it and send it back to the host computer. All this with the use of the keyboard. The HP 150 can also send electronic mail and operate a range of peripherals at workstations. Needless to say, this can really move things along. The Touchscreen Personal Computer is a Hewlett-Packard product. This, after all, could be the most important thing you need to know about it. Your professional reputation depends on the key decisions you make. Office automation is one of those decisions. You need to know and trust the company you go with. Hewlett-Packard's long-standing reputation for excellence is a given in the industry. And our service and support will make sure you aren't standing still when you should be flying. See the HP 150 at your local dealer or for information call (800) FOR-HPPC today. Find out how a personal computer with a sense of touch makes a lot of sense for your office.

also be accessed for $280/mo from Monchik-Weber customers already leasing the firm's terminal, screen and printer package. That package leases for $500/mo.

Monchik-Weber, 11 Broadway, New York, N.Y. 10004.

ON-LINE DATA BASES

MEAD DATA CENTRAL, INC.
Electronic Clipping Service

Mead Data Central, Inc. has announced a series of additions to its information retrieval systems and a new pricing option for the on-line information services.

Electronic Clipping Service (Eclipse) is designed for use with Mead's computer-assisted retrieval services, which include Lexis and Nexis. The service allows users to track areas of interest automatically on a daily, weekly or monthly basis.

Eclipse search results can be printed in formats ranging from only the relevant portion of an article to the full text of documents, a spokesman said.

The reports contain all the information added since the last report, and users can request a printout of every document in the data base that fulfills their search. The service is priced at $216/mo for daily reports, $54/mo for weekly reports and $18/mo for monthly reports.

Mead also announced that, beginning midyear, *Time*, *Fortune*, *Sports Illustrated*, *Money*, *Discover*, *People* and *Life* magazines will be available on its Nexis service. Past issues of these publications will be added gradually, the spokesman said.

Mead Data also announced a new pricing plan for Lexis and Nexis that will be available to private sector subscribers between April 1 and June 1.

The spokesman said the price of each search will be based on the value and amount of information in the file or group of files accessed.

Prices will range from $9 to $18 per search during peak hours, and a 50% discount will be available during off-peak hours. Searches can also be modified for $3 or $1.50 during off-peak hours.

Connect charges for reading, scanning and printing on-line have been reduced to $20/hour plus telecommunications costs, which are typically $8/hour. Off-line printing on high-speed printers leased to subscribers will be 2 cent/line as of June 1.

Mead Data Central, 9333 Springboro Pike, P.O. Box 933, Dayton, Ohio 45401.

MONCHIK-WEBER CORP.
Ticker III

Monchik-Weber Corp. has introduced a service which reportedly provides real-time market information consisting of prices and statistics from over 30 exchanges as well as fundamental and historical information.

Called Ticker III, the service is designed for brokerage firms, money managers, banks and insurance companies, the vendor said.

The cost to lease the service for in-house use is $40 per accessing device with a minimum charge of $2,400/mo per account.

Monchik-Weber, 11 Broadway, New York, N.Y. 10004.

TRAINING

MVC ASSOCIATES, INC.
Focus Reporting for the End User

MVC Associates, Inc. has announced an addition to its line of interactive computer-based training (CBT) courses.

"Focus Reporting for the End User" contains between six and 10 hours of basic training for users of Information Builders, Inc.'s Focus fourth-generation language.

The course uses IBM's Interactive Instructional System and is also compatible with Goal Systems International, Inc.'s Phoenix system. The CBT costs $4,500 and can be leased for $175/mo.

MVC Associates, 849 N. Summit Ave., Lake Forest, Ill. 60045.

SECURITY from page 59

yes, security can easily be compromised because the record defines a file to the system with one bit that states whether the data set is protected or unprotected. If that bit, accidentally or otherwise, gets turned off, all protection is lost.

If the system should fail, will it fail without incident? Default systems do. Other systems that operate with exception protection may not.

Is there a transitional capacity for gradual implementation of the security system? This feature is most helpful at initial implementation.

Was the product initially designed for security by default? If a company's security software decision leans toward the default system, it would be wise to determine if it was designed that way or if it has been "patched" to the default system.

Are there users who can be contacted about the product? This could be the most important question and can yield valuable information. Another user might find it difficult to relate one specific application to a different kind of application, but could provide enlightenment regarding ease of use, installation, support systems and other information.

Susan is marketing manager for Cambridge Systems, Inc., which markets the ACF2 algorithmic security product developed by SKK, Inc.

FALCON
on-line data entry that's above and beyond the ordinary

For an easy-to-use, completely interactive data entry system that's designed especially for the end user, you need FALCON.

FALCON operates standalone or as a task under CICS and the other major TP monitors giving you total flexibility and performance. It supports both DOS and OS operating systems to provide versatility and upgrading capabilities. And FALCON automatically converts VIDEO/370 formats.

FALCON's high-level security system protects your data against unauthorized access. It lets you decide which operators can use specific functions. And with FALCON you never worry about losing data. If the system fails, all data is recovered. If a terminal breaks down, just go to another terminal, rescue your data, and start working – right where you left off.

FALCON's on-line instructions help you design screen formats, enter and verify data, maintain files, create tables, and submit your own jobs. Just touch a key, tell FALCON what you want to do, and the instructions appear right on the screen.

With FALCON, you can make decisions based on the productivity of your operators without leaving your office.

You can monitor the progress of all active terminals and view job accounting statistics on-line.

FALCON's built-in edits include table lookup, range testing, defaults, balancing, and much more. FALCON goes far beyond other data entry systems to let you use your terminal as an operator's console and view the activity and contents of the input and output queues.

So make sure you're getting the most from your resources. Choose FALCON. Call for a free trial. You'll be glad you made the right choice.

FALCON®

PACKAGES from page 59

If one or more software packages are found that appear to be candidates, you should investigate a number of related factors (see checklist below).

The buyer of application software should always go in with his eyes open. Who is the vendor or supplier, and how important is his reputation, experience, financial status, support policies, staff size and continued existence? Does the proposal explicitly describe the product and services to be provided, cost of the product, cost of modification or enhancement services, delivery dates, training to be provided and the documentation that will be supplied? In some cases, a small vendor may ask for some up-front money as partial payment to finance the completion of a product. In exchange, you may be offered a royalty on future sales of the product. There is certainly room for negotiation here, but do not be diverted from the main goal of satisfying your own client first.

Additional items should be formalized in any software contract. For example, does it include penalties for late delivery, definitions of acceptance and future support services and a commitment to maintain compatibility with future versions of the operating system or hardware? Are you allowed to use the package on any computer in your company or just one specific system? If the latter is true, what will be the charge for additional copies to use on other machines? Will there be a royalty payable to you if other sales of the package are made? Are you allowed to market the package or a revised version of it? If so, what financial and support arrangements are documented in the contract? A couple of areas sometimes overlooked are the payment schedule and reimbursement for expenses.

An understanding should be reached before the contract is signed regarding implementation steps, the time schedule and each party's responsibilities. Must you furnish computer time, office space and so on for the completion of development and the conversion, or will all this work be done on the vendor's system? If there is a choice, what are the costs of each alternative? You might want to install remote terminal equipment in the supplier's offices for access to your system. Also, what other resources, such as people and test data, must be provided? Finally, clearly defining the testing procedures and what constitutes acceptance are of utmost importance.

Of course, there are many other details involved in the buy-and-make consideration than can be discussed here. I would encourage you to be free from the "not invented here" syndrome. Do not expect perfection, but demand quality products and professional services. Your primary focus should be on your user's needs and the time and cost of meeting those needs. If by buying and tailoring a software package you are able to satisfy your user in a more timely and/or economic manner, you can take pride in your accomplishments.

Gilliam is an independent consultant based in Ponca City, Okla. He is a regular contributor to Sightline.

Get your hands on USING SAS* now.

Get USING SAS, the interactive computer-based training that gives end users "hands on" experience they can get their hands on now.

Designed not only to teach, but as an ongoing refresher, USING SAS is three courses in one:

- Basic SAS
- Intermediate SAS
- Advanced SAS

Report generating, statistical analysis, data manipulation are all learned by writing SAS programs. Users may select as many sessions as they need, but you install and register only once.

Written by bestselling DP author Gary DeWard Brown, USING SAS comes with a comprehensive student workbook, available for reproduction by all USING SAS customers.

And, as with all CRWTH courseware, your satisfaction is guaranteed. CRWTH'S unique free trial lets you evaluate the course to make sure it meets your training needs.

*SAS is the registered trademark of SAS Institute, Cary, N.C.

Capital to get downtown teleport

WASHINGTON, D.C. — The world's first downtown satellite communications teleport, which will provide direct access to both U.S. and Canadian satellites, is scheduled for completion by midsummer.

The satellite communications complex, called The National Teleport, will be built on top of the National Press Building in the heart of the nation's capital, a spokesman said.

It is intended to be used by domestic and international broadcasters, news organizations, corporations, associations and government agencies as an alternative to the telephone network for intercity transmission of video, voice and data, according to the spokesman.

The National Teleport is a partnership of National Teleport, a wholly owned subsidiary of Videostar Connections of Atlanta, and Microwave Express, a wholly owned subsidiary of Pyramid Video, located here.

Other teleports being constructed are situated in outlying suburban areas to avoid interference with other communications technologies.

The downtown location is made possible because the teleport will use Ku-band frequencies, which are not used in terrestrial communications, thus enabling the teleport to operate in even microwave-congested metropolitan areas, according to a spokesman.

Initial plans call for installation of two 5-meter Ku-band transmit/receive earth stations.

The earth stations will be connected with multiple fiber-optic cables, coaxial cables and microwave links to locations throughout the greater Washington, D.C., area, according to the spokesman.

There will be expansion space for as many as six additional earth stations, the spokesman said.

Matrix switch integrates net monitoring, management

NORWALK, Conn. — Data Switch Corp. has announced a matrix switch that has integrated network performance monitoring and management reporting capabilities. This eliminates the need for separate systems for these functions, the vendor said.

Designed and developed by Data Switch's subsidiary, Intellinet Corp., the Intelli-MAX enables users to monitor the performance of their networks and use the device to switch out bad components or lines.

A feature unique to the system, the vendor noted, is Dynamic Rotational Monitoring. This enables the user to monitor critical portions of his network continuously while monitoring less crucial lines on a rotational basis at user-defined intervals.

Up to seven layers

Network management features reportedly include graphic display of up to seven layers of network activity and information on specific communications applications.

The condition of the network is displayed using a color-coded system in which, for example, red would tell of a line failure, incomplete transaction or control unit failure.

Gradual network degradation can be monitored and flagged when it reaches a threshold specified by the user. Intelli-MAX displays network activity minute by minute and in five-minute color trends, the vendor said.

Once a failure or degrading condition has been identified, the matrix switch allows instant reconfiguration of the network via simple commands from the monitor terminal.

Intelli-MAX supports from 16 to 512 lines. The unit costs $61,400 in a fully configured system and will be available in the fourth quarter of 1984, Data Switch said from 444 Westport Ave., Norwalk, Conn. 06851.

Bell Atlantic to offer two local nets

PHILADELPHIA — Bell Atlantic announced plans here late last month to offer two local-area networks. One is the Pronet, virtually a carbon copy of IBM's much discussed but as yet unreleased token ring. The other is the Datakit virtual circuit system (Datakit VCS), manufactured by AT&T Technologies, Inc., formerly Western Electric.

Pronet is manufactured by Proteon, Inc. of Waltham, Mass. It is said to operate at a speed of 10M bit/sec between host interfaces.

The Datakit system was reportedly designed for applications involving lower transmission speeds, more users and bursty messages rather than lengthy messages.

Bell Atlantic said it had signed letters of intent with Proteon and AT&T Technologies covering the marketing of the two products.

They will be offered by Bell Atlanticom Systems, Bell Atlantic's nonregulated, separate subsidiary.

Bell Atlantic is one of the seven regional holding companies established in the wake of AT&T's divestiture on Jan. 1. The company encompasses four divested Bell operating companies — Chesapeake and Potomac, New Jersey Bell, Diamond State Bell (Delaware) and Bell of Pennsylvania.

THE BIG THREE IN BUSINESS SOFTWARE. BEFORE YOU BUY, SEE HOW THEY RUN.

Run their general ledger. Their payroll/personnel. Their entire product line of financial and human resources software. Run the packages on your mainframe and link them to your PC's. Run them together and see if they work together.

You may well conclude that even though each of the big three has succeeded in business, only one of them has succeeded at integrating business application software.

And if your company size is $100 million in sales or more, this discovery could spare you the pain of much lost time and money over the next few years. Because when you acquire a half dozen systems that fit together in name only—but not in fact—you face six times the training, six times the delay and six times the anxiety.

We believe your evaluation will show you this:

Two companies offer the mere appearance of integration. An agglomeration of business applications linked superficially. Through a web of hinges, patches, bridges, shadow files and masks lurking just below the surface.

While one offers the real thing. Millennium. A true family of systems in which the whole works as smoothly as any part. In which every package has the same query mechanism, the same report writers, the same screen generation, the same on-line documentation, security and real-time capabilities. So that when the packages are put together, there are absolutely no borders between them. They fit like pieces in a jigsaw puzzle. Making the most efficient use of all your data processing resources.

There's even a Millennium application development tool, so you can create new systems as you need them. Without slow, expensive programming.

Millennium means integration in fact. Not just in name. And it is available only from McCormack & Dodge.

Of the big three in software, who's blind to integration and who's not?

When you see how they run, you'll know the answer.

WHEN YOU THINK ABOUT TOMORROW, MILLENNIUM MAKES SENSE TODAY.

MCI plans to expand Cablephone system

WASHINGTON, D.C. — Cablephone, an "alternative local transmission system" developed by MCI Communications Corp., may be installed in as many as eight more cities during the coming year, said MCI Senior Vice-President Brian Thompson last week. "It all depends on the FCC and local telephone companies."

Cablephone systems are now operating in five locations — Omaha, Atlanta, Fort Lauderdale, Fla., Anaheim, Calif., and Rye Brook, N. Y. All of the users are business firms, Thompson said. Although they pay the same rate for Cablephone access that they would for conventional access via telephone-company-provided analog local loops, they obtain much better quality service. "Cablephone conversations are as good as, and possibly better than, what the local telephone company provides," he contended, adding that this is because MCI controls both ends of the local loop — something it can't do when telephone company facilities are used.

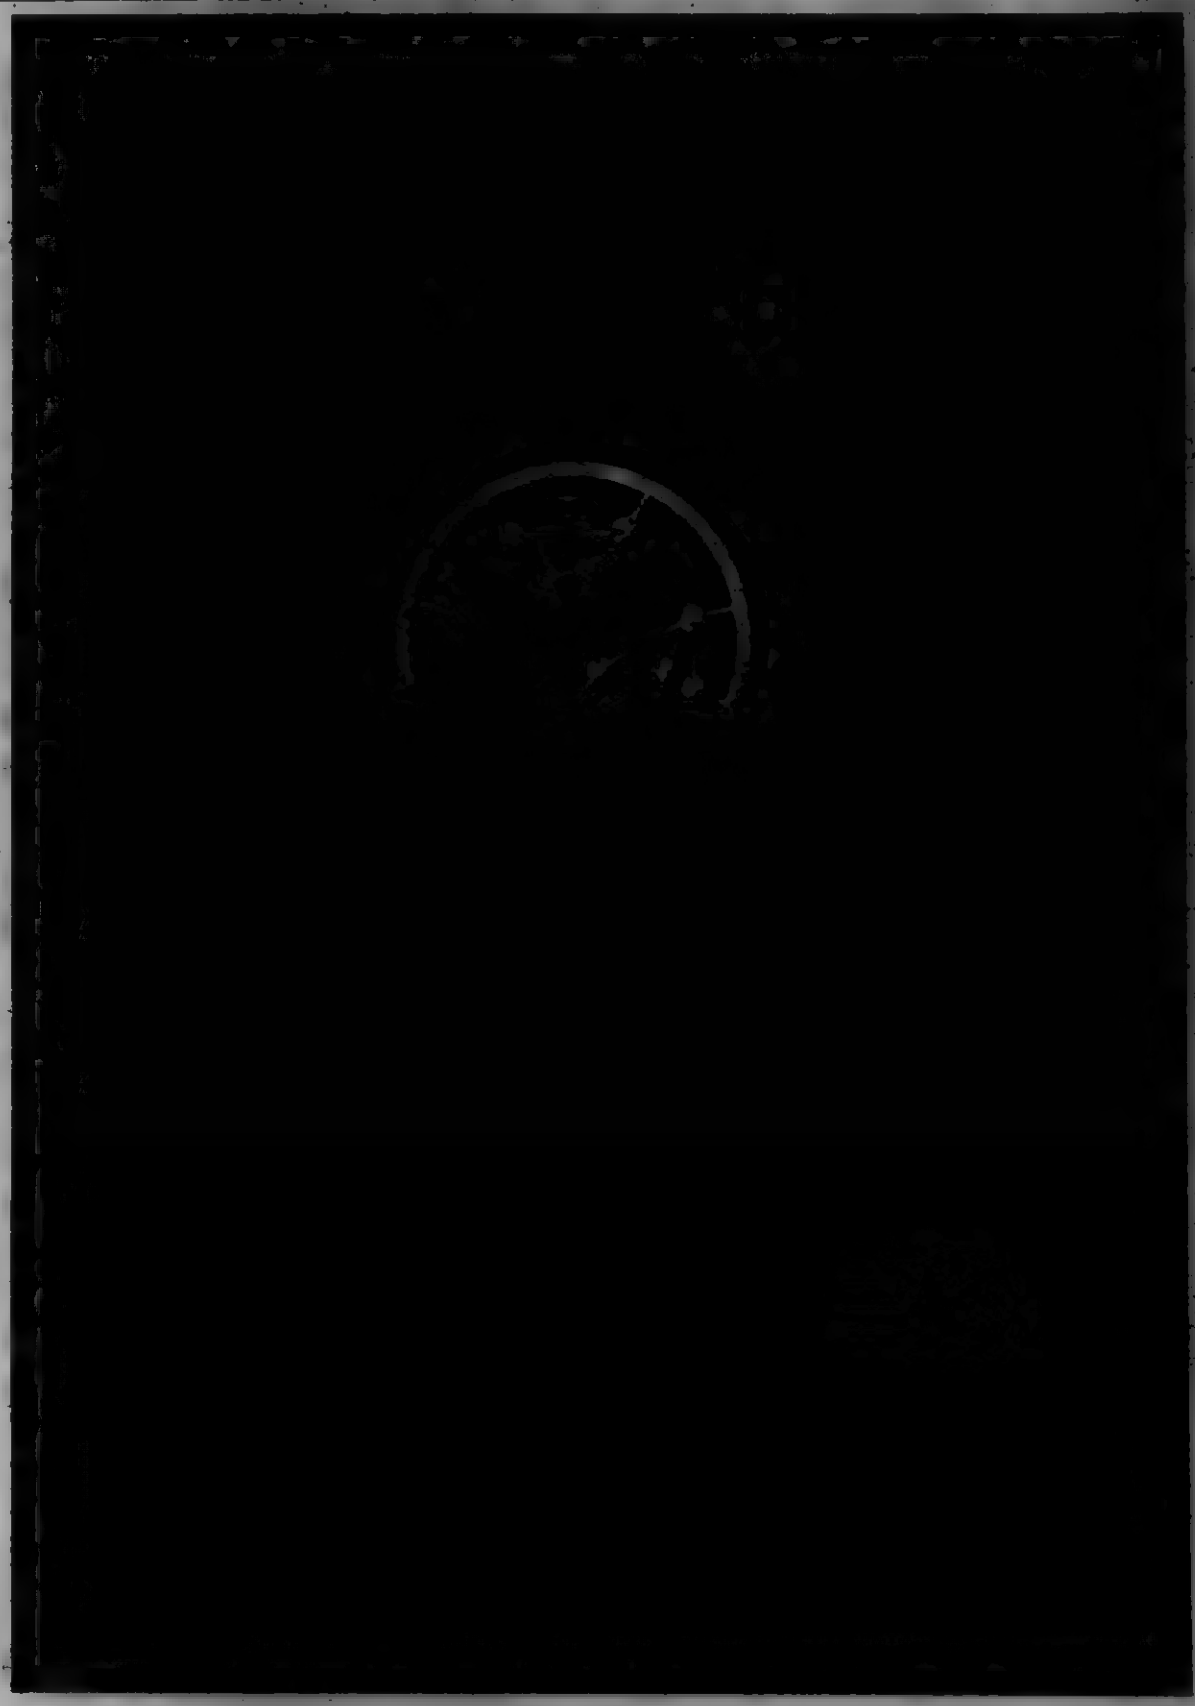
Another user benefit of the new system is that service usually can be acquired in far less time. In one case, Thompson said, MCI supplied a customer with several voice-grade circuits within a month after receiving a request for a quotation; the local phone company, he added, was unable to deliver in less than 10 months.

It costs MCI less to use CATV channels to provide service than telephone company local loops, and after April 3, when access charges are scheduled to increase considerably, the savings will be "far greater," Thompson said.

But Cablephone is not a panacea. For one thing, the system can be installed only in those cities which have institutional two-way CATV systems. It will be "several years" before these facilities are deployed in most cities, Thompson pointed out.

"Cablephone is only one of a number of alternative local distribution methods we are exercising," he explained. Others include Digital Termination Systems (DTS) and cellular radio. At the moment, Cablephone seems to be the most useful alternative, Thompson said, because it can be deployed in a limited number of cities at a favorable cost. DTS is more expensive, but "we expect the technology will become considerably more cost-effective during the next three to five years."

Ultimately, the future of Cablephone and the other alternative local distribution systems will depend on the FCC, Thompson added. "The higher the rate for local business service, the more attractive these alternatives become. Recently, the commission rejected one set of tariffs filed by the local carriers, which proposed increases of up to 300% in rates for leased lines connected to long-distance networks. It will be interesting to see what the revised rates look like and how the commission responds to them," he said.



Interface links Apollo Domain to IBM systems

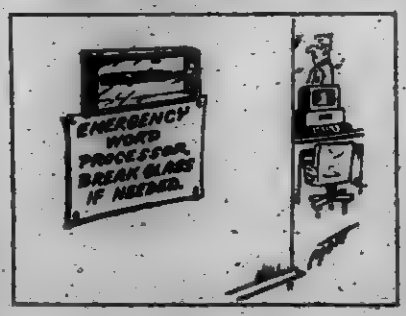
AUSTIN, Texas — Auscom, Inc. has announced an interface to link an Apollo Domain network directly to an IBM or plug-compatible mainframe.

The Model 8911A Programmable Channel Interface connects directly to the block multiplexer, byte multiplexer or selector channel of an IBM or compatible mainframe, and emulates a standard control unit in the host architecture, the vendor said.

After data is received from the host at channel speeds, a direct memory access (DMA) interface in the 8911A completes the data transfer to a Multibus/DR11W DMA card in the Apollo. This DMA card is made by Ikon Corp., Seattle, Washington. Drivers for the Auscom and Ikon DMA cards are available from Auscom and Apollo, respectively. The specification for the data protocol is available through Auscom.

All Apollo Domain nodes can have access to IBM mainframes and plug-compatibles through the interface unit, a spokesman said. Prices range from $16,000 to $21,000. The software license for the 8911A to support the interface is $1,000.

Auscom is based at Suite 102, 2007 Kramer Lane, Austin, Texas 78758.



COMMUNICATIONS

CONTROLLERS

INNOVATIVE ELECTRONICS, INC.
MC-80/600-1

Innovative Electronics, Inc. has announced a communications controller that emulates the IBM 3274-51C controller and enables the use of Digital Equipment Corp. VT100 or compatible terminals in the place of IBM 3277-1, 3277-2, 3278-1 or 3278-2 terminals for communications with IBM host systems.

According to the company, full-screen mapping is performed by the MC-80/600-1, and data displayed on the asynchronous Ascii terminals will be the same as an IBM 3277/3278 display station, with virtual screen sizes of 480, 960 and 1,920 characters. Status information is displayed in English at the bottom of the screen.

The stand-alone, self-powered controller has up to 16K bytes of read-only memory and 16K bytes of random-access memory and can support two dumb terminals for $1,495. Additional ports can be added two at a time for $200.

Innovative Electronics, 4714 N.W. 165th St., Miami, Fla. 33014.

ADVANCED COMPUTER TECHNIQUES CORP.
Network Processor

Advanced Computer Techniques Corp. has announced support for IBM and plug-compatible 3270-type display stations, printers and personal computers using its Network Processor (NP).

According to the vendor, the NP can be used in remote concentration, message switching and front-end processor applications. The NP provides access to multiple hosts from the same terminal.

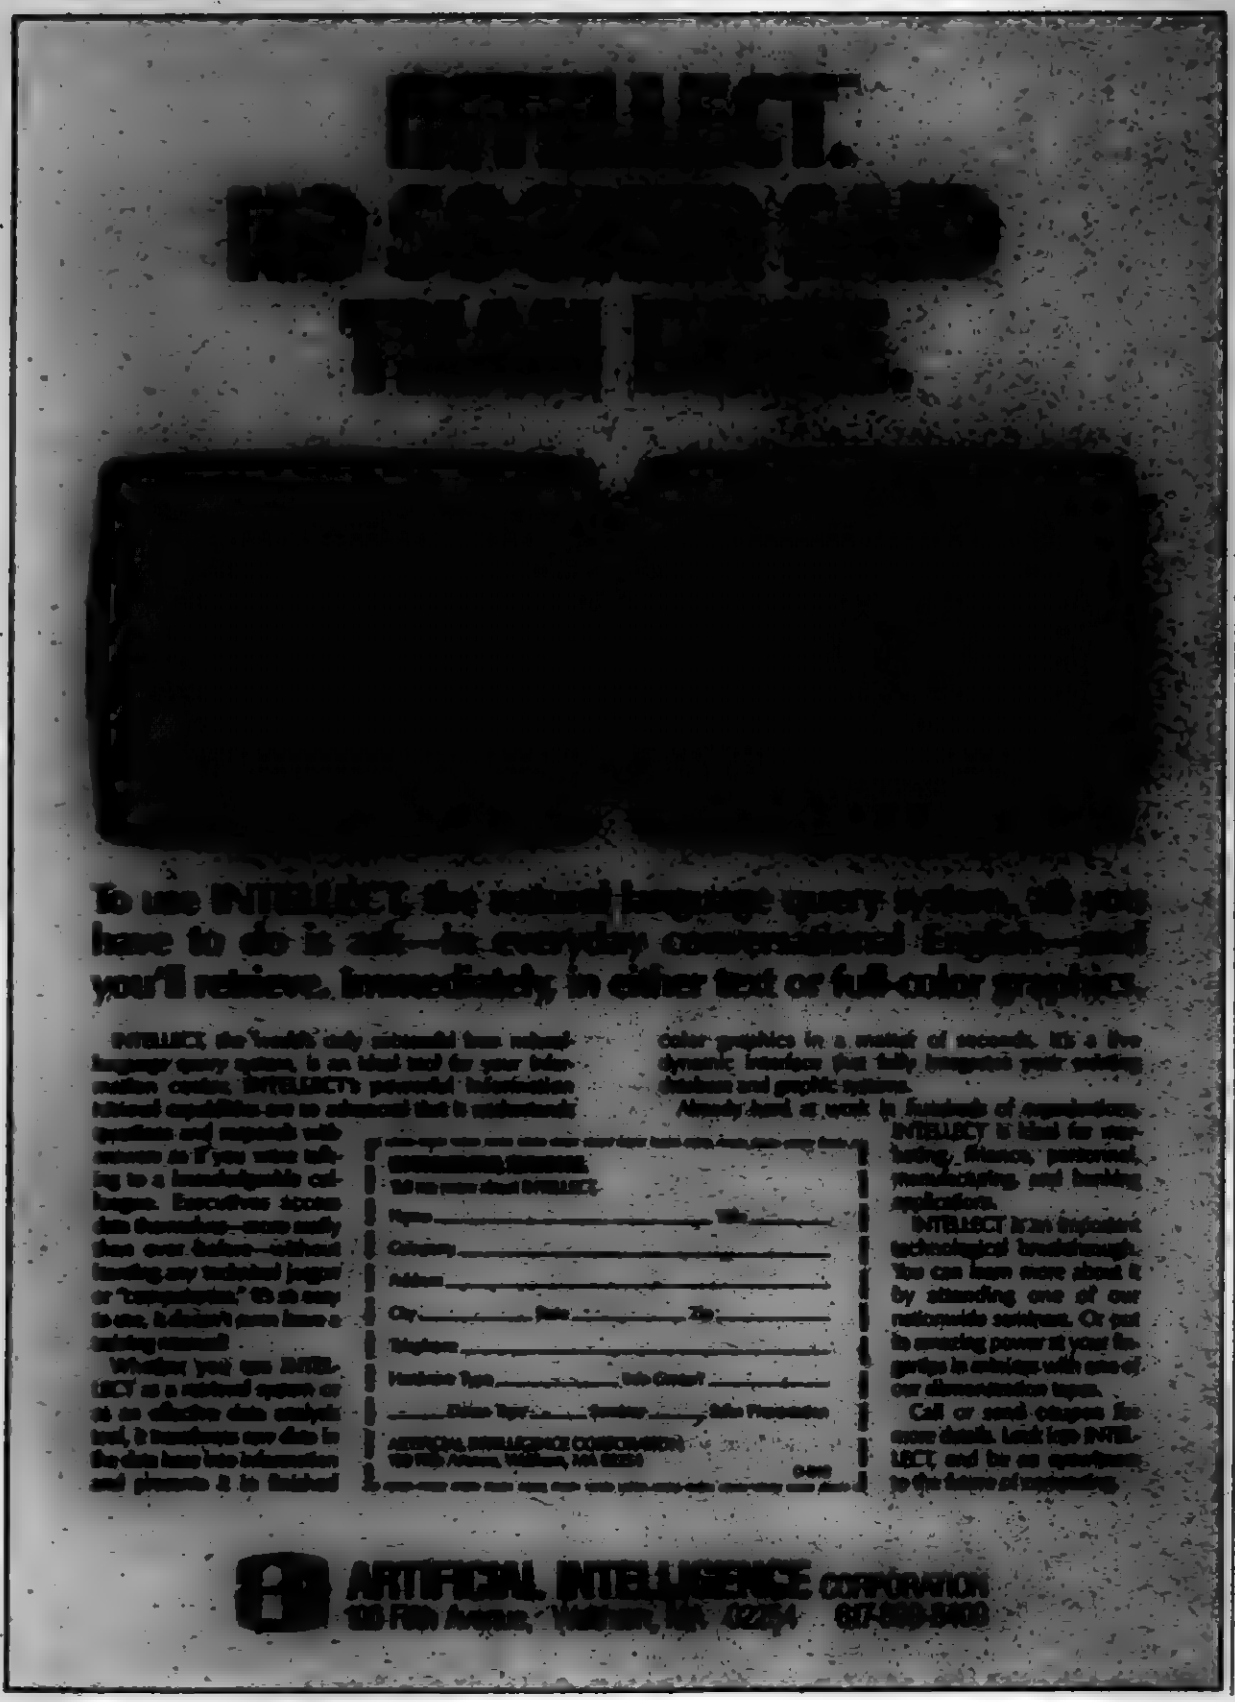
A terminal emulation facility is used when accessing host systems that do not natively support 3270 terminals or when existing applications were designed for non-3270 screen formats.

The NP supports both interactive and store-and-forward message switching and can also be used as a remote concentration device that provides local polling, a vendor spokesman said.

The system is available in several different configurations. The hardware consists of modular 16- and 32-bit CPUs and microprocessors. These configurations are designed to support from two to several thousand end points (terminals and printers) and a variety of hosts, terminal types and protocols. Stations can be connected via dial-up, leased or direct-wire lines. Auto-call support is also provided, the vendor said.

A processor with 128K bytes of memory with up to eight communications ports and a 13M-byte disk is priced at $20,000. The base price for the software is $100,000.

Advanced Computer Techniques, 16 E. 32nd St., New York, N.Y. 10016.



PROTOCOL CONVERTERS

PERLE GSD, LTD.
PDS 300/525 Release 15

Perle Gsd, Ltd., in conjunction with Perle Systems of Toronto, has announced Release 15 of the PDS 300/525 protocol converter. In an effort to add value to its protocol converters instead of offering them as simple translation devices, Perle has targeted the Release 15 at remote printing applications.

Release 15 enables an IBM System/34, 36 or 38 to be programmed to dial up and access remote devices, including the 5256 or 522X IBM printers.

The PDS 300/525 protocol converter is a diskette-based unit. It is available in 4-, 8-, 12- or 16-port configurations.

Prices range from $4,800 to $13,500.

Perle Gsd, Suite 507, 600 S. Dearborn St., Chicago, Ill. 60605.

ICOT CORP.
Protocol conversion

Icot Corp. has announced an IBM 2780/3780 to 3270 Binary Synchronous Communications (BSC) protocol conversion capability for its Crystalink 25X series of communications processors.

The series of communications processors can interface multiple standard IBM 2780/3780 RJE devices to an IBM host as a 3271 cluster controller communicating in 3270 BSC. A maximum of 27 RJE devices can be accommodated in the Model 257 communications processor — the largest of the Crystalink family — the vendor said.

Prices for the series range from $5,200 to $30,000.

Icot, 630 Maude Ave., P.O. Box 7248, Mountain View, Calif. 94039.

LOCAL-AREA NETWORKS

BRIDGE COMMUNICATIONS, INC.
CS/1-X.25

Bridge Communications, Inc. has announced an X.25 option for its Communications Server/1 Ethernet interface unit.

The CS/1-X.25 is a software and interface board option that enables the company's Communications Server/1 to serve as a front-end processor to host systems with X.25 interfaces.

This enables a host to be connected to an Ethernet network through a single X.25 interface, instead of

COMMUNICATIONS

through the 32 individual RS-232 ports previously needed, and increases to 48 the number of simultaneous sessions supported.

After the product is installed in front of the host, any terminal linked to another Bridge CS/1 or CS/100 unit can access the host, the vendor said. Hosts connected to different CS/1-X.25s can transfer files using their standard X.25 file transfer utilities.

CS/1-X.25 accommodates the three standard interfaces: RS-232C, RS-422/449 and V.35, a company spokesman said. The price is $13,000.

Bridge Communications, 10440 Bubb Road, Cupertino, Calif. 95014.

RAYCOM SYSTEMS, INC.
Raycom 2000 enhancement

Raycom Systems, Inc. has announced a multipoint/broadcast enhancement for its 2000 interconnect system for office, medical, scientific and industrial automation networks that use fiber-optic technology.

The enhancement reputedly allows any device to communicate with all other devices on the network. A multipoint protocol can be used to transmit data to all devices connected to the network.

The Raycom 2000 costs $159.

Raycom Systems, 6395 Gunpark Drive, Boulder, Colo. 80301.

TEST EQUIPMENT

INTERNATIONAL DATA SCIENCES, INC.
Bert/Biert for Hawk Model 4010 Datatrap

International Data Sciences, Inc. has announced additional features for its Hawk Model 4010 Datatrap and modem terminal simulator. The CRT now incorporates full bit and block error rate (Bert/Biert) testing as a standard feature.

The enhancement features full screen display of Bert/Biert functions, error rates and Bert patterns, a company spokesman said.

The 4010 costs $2,995. Existing field units may be upgraded, according to the vendor.

International Data Sciences, 7 Wellington Road, Lincoln, R.I. 02865.

DATACOM NORTHWEST, INC.
Datamonitor

Datacom Northwest, Inc. has announced the RS-232 V24 Datamonitor, a pocket-size device that is powered by the lines it monitors.

Seven LEDs monitor positive voltage transitions. The product has an extra female DB25 connector to allow the connection of additional data testing equipment, the vendor said.

The price is $99.

Datacom Northwest, 11300 35th Ave. N.E., Seattle, Wash. 98125.

AUXILIARY EQUIPMENT

COMPUSERVE, INC.
Interchange

Compuserve, Inc. has announced Interchange, a private videotex information service for corporations and government agencies.

Information is presented through a structure of menus pages. By choosing among the options presented, users can locate, retrieve and respond to the information of interest.

Examples of applications include office project scheduling, job listings, training programs, dissemination of high-level management directives, policies and procedures, order entry functions and newsletters. Product line price revisions, reporting policies and procedures and sales reporting are also appropriate for the videotex medium, the vendor said.

The price for two-port, unlimited access to Interchange and the company's electronic mail service is $5,000/mo for a yearly commitment, according to the vendor.

Compuserve, 5000 Arlington Centre Blvd., P.O. Box 20212, Columbus, Ohio 43220.

TELEPROCESSING PRODUCTS, INC.
TP-550

Teleprocessing Products, Inc. has announced the TP-550 channel service unit, an interface unit designed for Dataphone Digital Service (DDS) circuits.

The unit supports DDS speeds of 2,400, 4,800 and 9,600 bit/sec. It connects to a data service unit by means of a six-wire interface and to the DDS channel with a four-wire interface, according to a spokesman for the vendor.

The TP-550 channel service unit costs $540, according to the spokesman for the vendor.

Teleprocessing Products, Building 7E, 4365 E. Industrial St., Simi Valley, Calif. 93063.

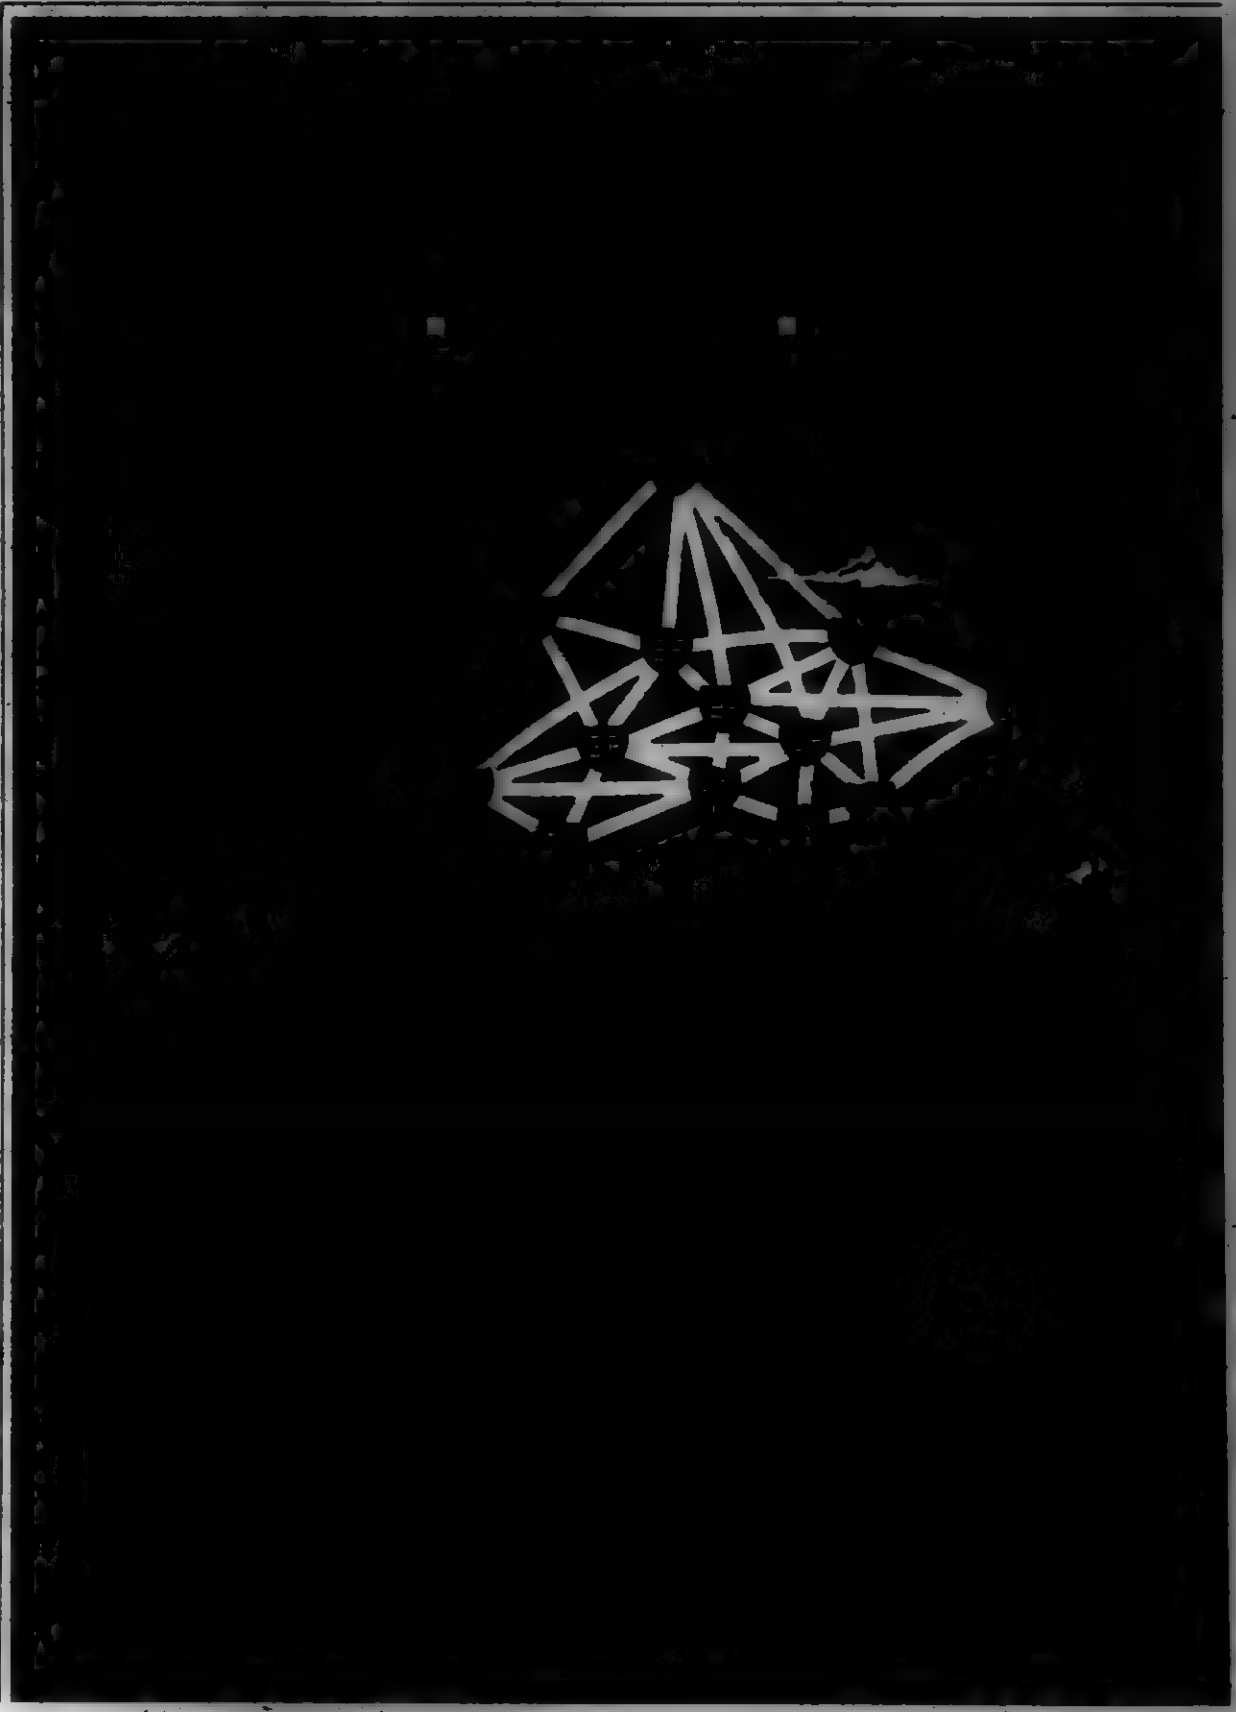
CORPORATION FOR DISTRIBUTED SYSTEMS
COM-80 Communications Interface

Corporation for Distributed Systems has announced the COM-80 Communications Interface for Hewlett-Packard Co. Series 80 personal computers.

The interface enables the user to turn a Series 80 into an application-oriented intelligent terminal and allows it to communicate with a host computer. The interface applications are function-key driven and include 2780/3780 RJE terminal emulation and asynchronous terminal emulation with file transfer capabilities, the vendor said.

In the bisynchronous mode some of the COM-80 capabilities include:

Continued on page 74



COMMUNICATIONS

Continued from page 73

support for standard speeds to 9,600 bit/sec, operation in point-to-point or switched-line environments, operation in conversational mode and automatic conversion of Ascii to Ebcdic.

Among other things, the asynchronous capabilities include standard bit rates to 9,600, according to a spokesman.

The price is $845, the vendor said.

Corporation for Distributed Systems, 15840 Addison Road, Dallas, Texas 75248.

PELORUS, INC.
Pelorus 2000

A new device recently introduced by Pelorus, Inc. speaks to telephone callers with synthesized speech and allows them to enter data to a computer system using the keys on a Touch-Tone phone.

The Pelorus 2000, with its current set of 240 words, can be programmed to ask callers to enter data such as stock numbers and prices. It can also be used for sending telegrams.

The Pelorus 2000 sells for $6,000.

Pelorus, 3624 Marvue Court, Monkton, Md. 21111.

VOICE/DATA COMMUNICATIONS

ISOLATION SYSTEMS
Enigma Secure Communications System

Isolation Systems has introduced the Enigma Secure Communications System, an integrated security and communications package for the IBM Personal Computer.

The system has a network capability of 64 terminals providing for over 2,000 potential individual links over the public telephone system. Security features include hardware-based, high-speed Data Encryption Standard encryption, key management, network organization, access control, tamper detection, authorization hierarchy and dial-back facility.

Isolation Systems, 1691 The Queensway, No. 6, Toronto, Ont. M8Z 5Y4.

IN DEPTH

ILLUSTRATION BY T.M. BARRETT

A tale of hope for anyone. . .

Lost in the software forest primeval

By Donald V. Steward

Once upon a time, programmers needed only flowcharts to find their way through the programming forests, for indeed the forests were small and they could see out in most directions. But as the forests got bigger and thicker, they lost their ways, wandering endlessly through the GOTOs, trying to remember where they came from. And the forests were filled with mutterings of, "We're 99% through the forest. Surely the next turn will lead us out into the light." And those who waited wrung their hands. And systems were late and their costs were outrageous. And nothing could be done. For sending more people into the forest caused more people to be lost in the forest.

Then a wise man said, "Of course you are lost and befuddled. You must put aside your foolish use of GOTOs, for they will mislead and confuse you." And someone remembered that a psychologist had once said, "I have found that people can only work with a very little amount of memory at a time." And someone said, "Yes, if

The wise men of systems analysis appear to go in different directions. Which one should project developers follow? A consultant takes a little from the different approaches and says, "It's so much simpler now."

you look at the whole forest, then a piece, and then a piece of that piece, you will finally be able to see the trees for the forest, yet you will only need a little amount of memory." Some called this methodology Top-Down, and others called it Successive Refinement or Hierarchical. It was shown that you could always write programs this way, and this way was called Structured Programming. And many people put "Structured" in the titles of their books and sold many copies, for indeed, Structured was good.

Now if Structured was good for programs, then surely it must be good for systems. So a wise man took his Data Flow Diagramming methods and called them Structured Systems Requirements, and he went throughout the country teaching all who would listen. And another wise man, hearing of a marvelous method from a faraway country, developed the Warnier-Orr diagram and called it Structured Systems Design, and he too went throughout the country, also teaching all who would listen. Other wise men looked at data flow between modules and called it "coupling" and said too much of it is bad; they looked at data flow within modules and called it "cohesion" and said it was good. And they showed how modules built this way were easy to program and maintain. And they called this Structured Program Design.

Now the wise men all agreed and said to the systems analyst, "Keep it simple" and "Do it top-down so your customer can review what you have done and tell you that you are doing it all wrong. And this is good because it saves you from building great buildings that fall down because they are built on foundations of sand." But to keep it simple, they said, "You cannot show this, or cannot show that." And so the customer saw and he said, "You have not shown this, and I don't think you understand what I want." And the programmer saw and said, "You have not shown that, and I don't know how to do it." And so both were confused. So the analyst couldn't go top down from the top to the down without cheating on the rules or changing the way the system was described.

Some wise men said, "We have shown other people how to use computers. Why is it we never use them ourselves?" So they developed ways to use computers to help do systems development. But these systems became very complicated and not many people knew how to use them. So they were used only by big companies.

And so there were many wise men. And they all said "Structured this" or "Structured that." And it was found that their methods were good, and programmers could always find their way through the forests. Well, almost always. So the followers of these wise men were happy. But when you followed one wise man it was hard to follow the other wise men too, for they often appeared to lead in different directions. And so programmers again became befuddled.

And college professors said, "We have the responsibility to show our students the true path," but they don't know which path was the true path. Some of their students go into a world led by one of these wise men, and others go into different worlds led by different wise men. And even some go into worlds where flowcharts still reign. And so the professors had their students buy many books.

And then a consultant and professor, hearing all this, said, "I think I understand what these wise men are all trying to say." He took a little here and a little there; he changed this and changed that and said, "I think it all fits together now. And it looks so much simpler."

And thus we leave this tale to enter the real world of systems development.

The tools we will describe are a compatible set. Each tool will be derived from one of the conventional tools, but will be modified and extended to make it more powerful, simpler to use and compatible with the other tools in the set. Among the conventional methods drawn from are Warnier-Orr methodology (K.T. Orr, *Structured Requirements Specification*), data flow diagramming (T. DeMarco, *Structured Analysis and System Specification*) and structured design (E. Yourdon and L.L. Constantine, *Structured Design: Fundamentals of a Discipline of Computer Systems Design*).

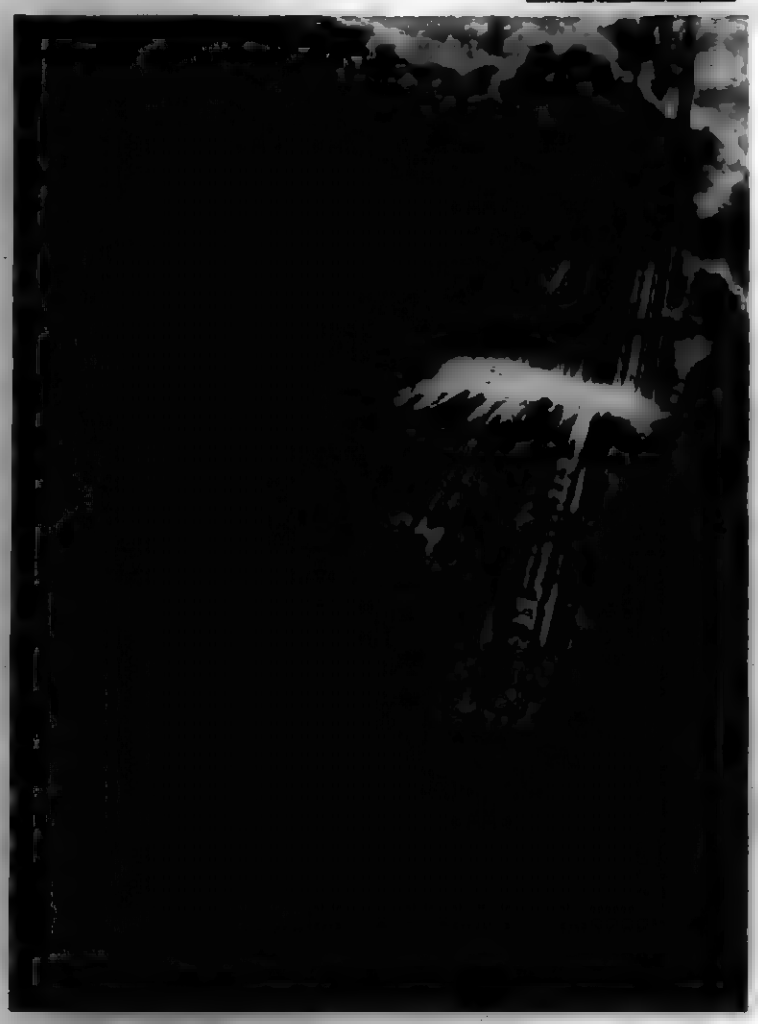
Trees

The Tree is derived from the Warnier-Orr diagram. But by using a Tree, it is possible to work with one system from the very top level at which the customer sees and understands what he wants done, down through several levels of detail, until enough logic and detail have been added that the computer program can be generated mechanically.

If you watch how people use Warnier-Orr diagrams, you will see that they violate the rules. Many of the rules for Trees are merely a formalization of this cheating.

It will also be shown how the Tree

NCR



From the cutting edge
of NCR software engineering comes
NCR/SNA Systems Network Architecture

If you are a computer manufacturer, or an OEM, there are two ways that you can implement SNA or X.25 on your systems:

- Do it yourself.
- Call NCR.

NCR systems engineers have developed portable communication products which can be easily implemented on a variety of processors and operating systems. These products allow for SNA communications, SNA network management and communication using X.25. Many of the products are immediately available, and could be ported onto most processors with minimum effort. And that's not all. NCR/SNA is backed by the resources and experience of an international company with a long background in data processing, and with the engineering technology that will keep it among the leaders.

In 1984, NCR is 100 years young. If you are going to make a major investment in a strategic product, you'll want the innovative technology and service for which NCR has long been famous.

If you are a computer manufacturer or an OEM, and would like more information contact:

NCR Corporation

can represent the control of parallel operations and how the data flow in the Tree can be revealed to help in developing the structured design of the modules.

Two-entity data flow diagrams

Our two-entity data flow diagram is a variation of the conventional data flow diagram.

Both use the same hierarchical methods for developing a system top down. But in using a two-entity data flow diagram, it is possible, where appropriate, to show the control at the greater levels of detail. Where this detail may be confusing, it can be left off.

Because we can show the data flow in a Tree and show the control in a data flow diagram — and because both can show parallel or unordered operations — it is possible to translate between one and the other, showing that the two methods are completely compatible.

Data structure matrices

The two-entity data flow diagram can be represented by a matrix, related to the Langefors matrix method. Then, combined with a data element dictionary, it forms a data structure matrix.

Using the data structure matrix, it is possible to analyze the system to see the effects of changes, to obtain the sizes of data stores, volumes of data flows, frequencies and timing of the execution of modules and the critical path timing of transactions through the system.

The data flow matrix can be represented in a data base, making it possible to do these analyses on the computer. In addition, all the current information is simultaneously available to anyone with access to the data base.

Top-down development

All these methods depend upon the idea of a hierarchy. A system that can be represented as a hierarchy can be developed top-down.

A hierarchy is like a set of boxes nested inside each other (see Figure 1). Each box has on its top an overall description of what is inside or what is to be done with what is inside. The details inside can only be seen by opening the box. As you look at one box, you do not have to worry about the details inside that box or about any of the other boxes.

Developing a system top-down involves defining the outer boxes first, then the inner boxes. The outer boxes describe what needs to be done. The inner boxes describe how to accomplish it.

The usual form of flowcharts is not very useful in this mode of thinking. They cannot generally be understood in a succession of chunks, each small enough to be mentally digestible. GOTOs can also do violence to this form of thinking by taking you from hither to yon without any underlying structure.

How do we represent such a hierarchical structure? By a tree. The branching structure of a tree corresponds to the hierarchical nesting of structures within other structures. (The Tree and some other ways of showing nesting are shown in Figure 1.)

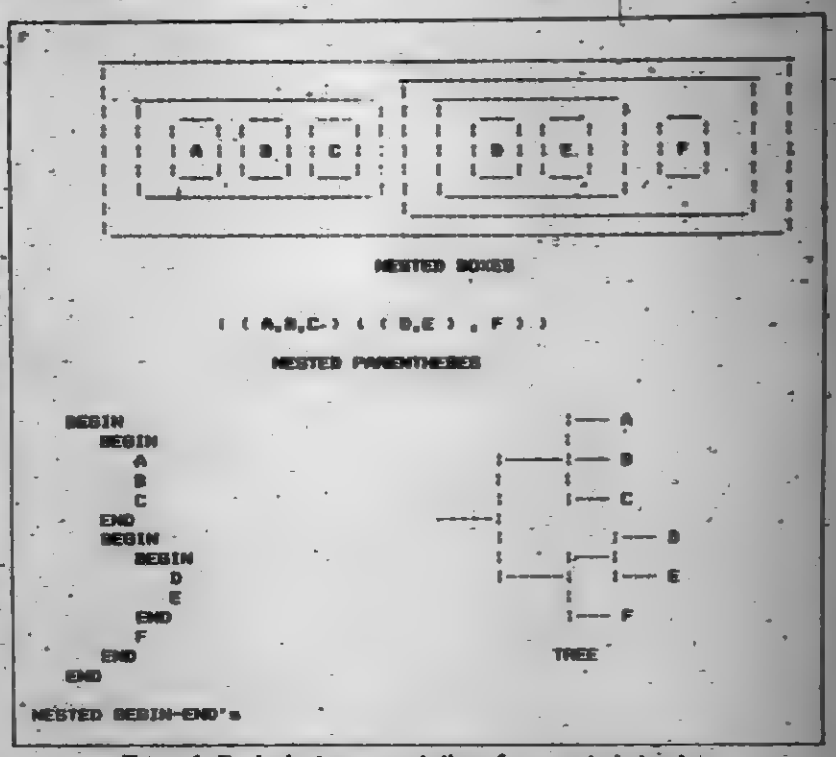

Figure 1. Equivalent representations for a nested structure

Programs as Trees

The Tree can be put to practical use with just the following rules, an elementary knowledge of structured programming, paper, pencil and a ruler. (The Warnier-Orr diagram has an advantage to its author because he can sell you a template to make the parentheses. Unfortunately, the author of the Tree probably wouldn't make much money selling you a straight edge.)

Any structured program can be represented as a Tree. The rules for a Tree are very simple. (You may wish to look at Figure 2 as you read these rules.)

1. The execution of the program begins and ends at the root. We refer

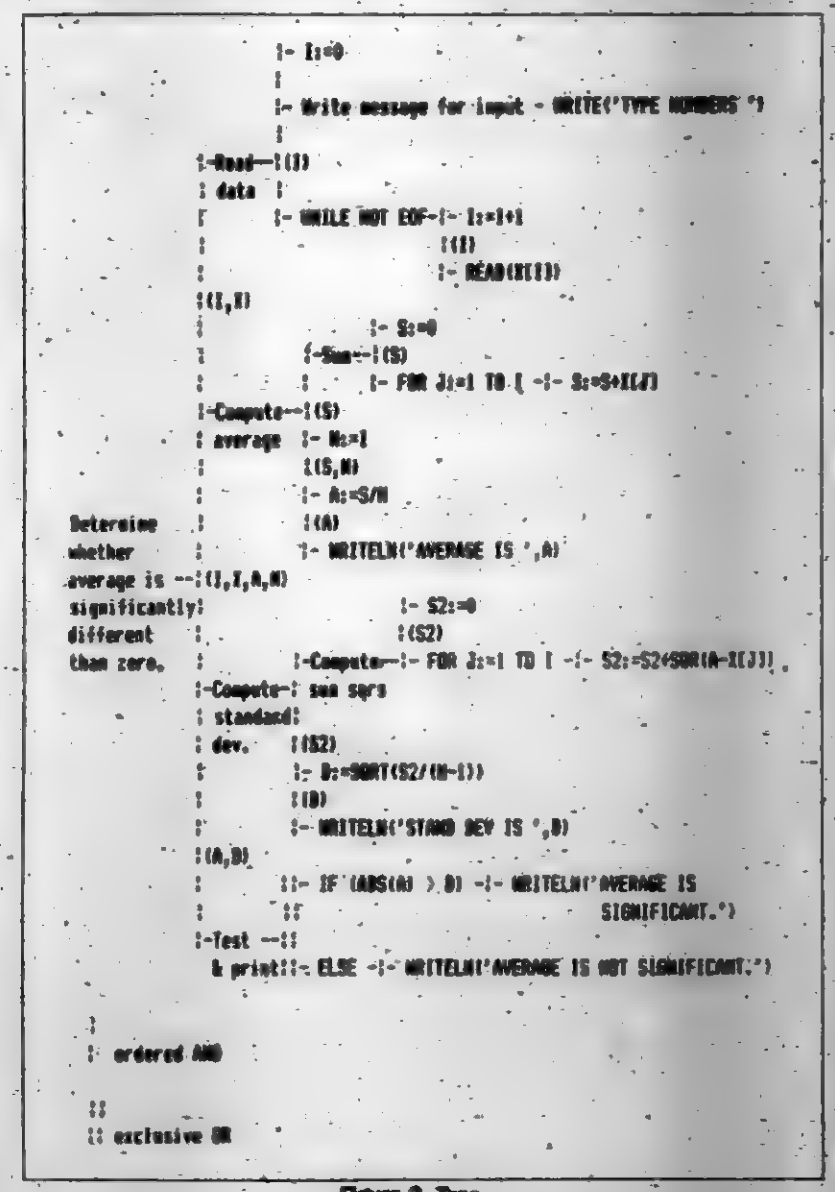

Figure 2. Tree

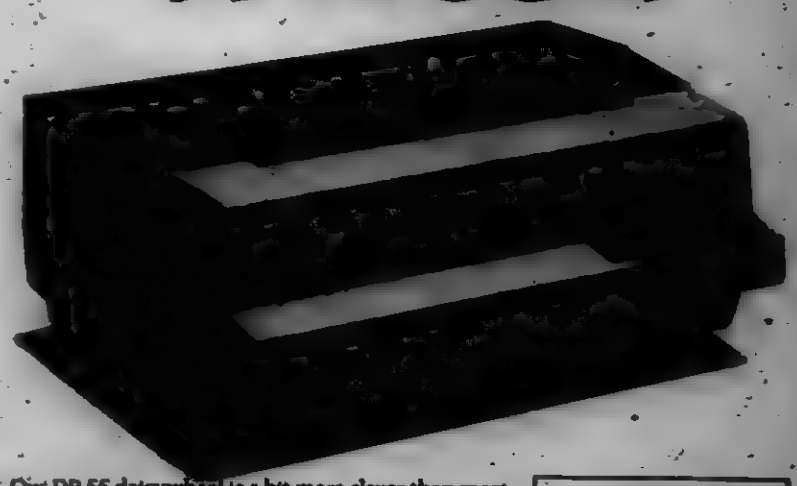
Brighter writer.



Our DP-55 datasywheel is a bit more clever than most. A digital status display tells you what it's doing as it prints, and how you can help when it doesn't. It can save you time and money, and that's just plain smart. Call your printer distributor. Or contact Dataproducts at (213) 887-3924, 6200 Canoga Avenue, Woodland Hills, CA 91365. In Europe, 136-138 High Street, Egham, Surrey, TW 20 9HL England.

IN DEPTH/TALE OF HOPE

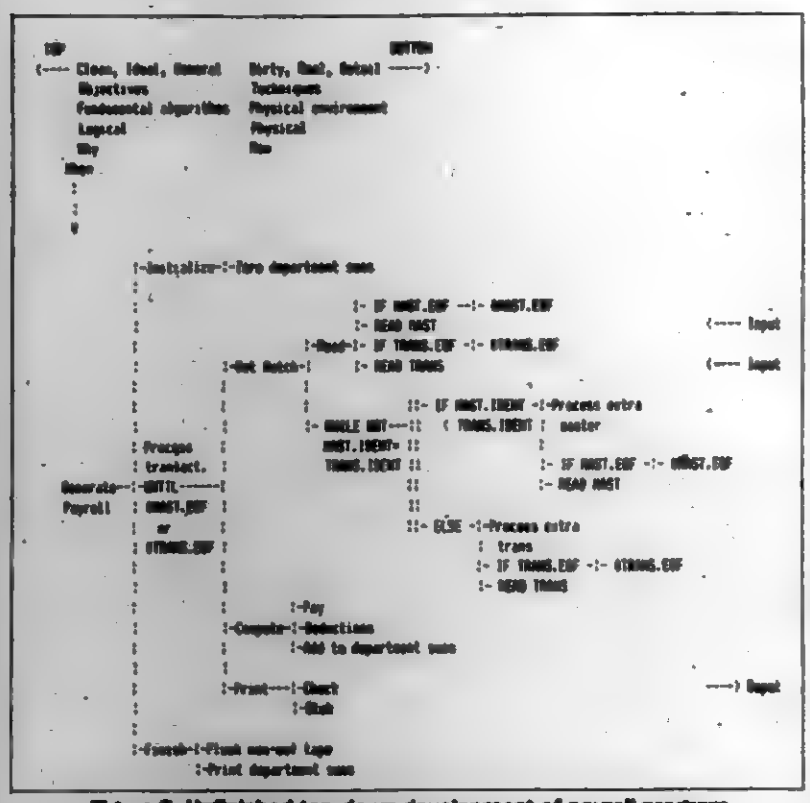

Figure 3. Unfinished top-down development of payroll program

to the root as the top of the Tree, but it is actually drawn at the left of the page. The root contains a general description of what the program does. Putting the "top" to the left and "bottom" to the right makes it easier to write text on the branches.

2. The vertical lines are called limbs, the horizontal lines, branches. The branches off the same vertical limb are executed in sequence, top to bottom.

3. The execution of a branch is completed once the subtree entered through that branch is completed. We may think of control as entering and exiting the subtree through the branch.

4. A branch may have on it a remark, a control statement or both. A remark describes what the subtree entered through that branch is to do. A control statement tells the conditions under which the branch is to be entered or how the subtree beyond is to be iterated.

5. The control statements are consistent with those used in structured programming languages: "IF condition," "WHILE condition" and "FOR variable = expression1 TO expression2." They control the execution of the subtree entered through that branch.

6. Remarks are written in capitals and lower case. Control and executable statements are written in all capitals.

7. A double limb is used to show that the branches off that limb are mutually exclusive; that is, at most one of these branches is executed. This structure is used to represent IF_THEN_ELSE and CASE.

8. A wiggly limb is used to show that the branches off that limb may be executed in parallel, or in any order.

9. The end branches, called leaves, are the executable statements, such as READ, WRITE and Assignment (that is, variable = expression).

10. A procedure call is shown on a leaf by the name of the procedure in capitals. A procedure can be represented by a Tree, with the procedure name at the root.

11. Recursion is shown by a call to a procedure within a procedure of the same name.

These rules are illustrated by the Tree in Figure 2.

Has the GOTO gone forever?

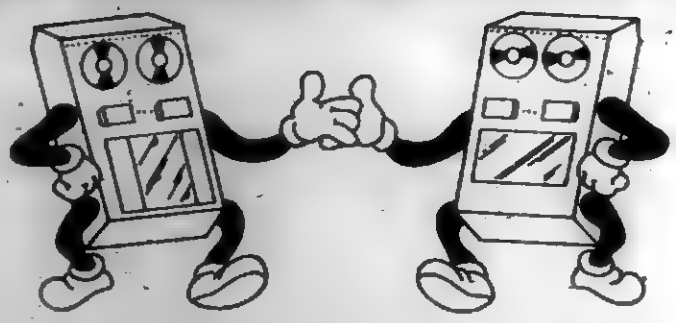
The GOTO has been hard to eliminate. Even Pascal has a GOTO for those few times when they are hard to avoid without introducing unnecessary complexity. But the Tree is a pure hierarchical form. To make the Tree work well, we must eliminate the GOTO forever. It is our claim that the "UNTIL #event" does precisely that.

The "UNTIL #event" is written on a branch. It causes the subtree entered by that branch to be iterated until the event occurs, at which time the subtree is immediately exited through the UNTIL branch. (By convention, the event name starts with #.) The event can be located anywhere within the subtree entered through the UNTIL branch, any number of levels beyond (see Figure 3.)

The "UNTIL #event" is not yet a standard structured language construct, so it must be simulated in these standard structured languages using a GOTO. It is our claim that the simulation of an "UNTIL #event" is the only time that a GOTO is ever needed, and if the language had the "UNTIL #event" construct implemented, no GOTO would ever be needed, nor would one have to write clumsy code to avoid it.

Note that the "UNTIL #event" acts like a "come from," showing where the control transfers when the event occurs. This allows an exit, not just to the next higher level, as in

OUR SWITCHES MAKE YOUR IBM SYSTEMS WORK LIKE A TEAM!



If you have more than one IBM or plug compatible processor, Digital can help you get the most for your hardware investment. Our switches allow you to achieve backup and peripheral configuration flexibility at a fraction of the cost you're probably thinking.

Whether you have two processors or more, Digital has a switch to suit your requirements.

- Model 4101 The lowest priced matrix switch on the market.
- Model 3421 The only manually operated channel switch in the industry.
- Model 3403 A remote controlled channel switch designed for underfloor installation.

Figure 4

some languages, but to any higher level where one is prepared to handle the consequences of the exit. This device is particularly useful for exiting on end-of-file or error conditions (see Figure 3).

The "UNTIL #event" and the wiggly line are useful in handling asynchronous processes. Parallel processes off the wiggly line can be initiated and continued until interrupted by an event or by conditions on one or more events. An exit then occurs through the UNTIL branch (see Figure 4).

Top-down development

Remarks are used in top-down development to describe initially *what* is to be accomplished. Later, the details showing *how* it is to be done are supplied as the Tree is expanded to the right.

Thus, as the Tree develops from left to right, details get resolved. The user can initially use the Tree to express with remarks on the branches what he wants done. The analyst then expands this Tree to further levels of detail, and the programmer expands it further yet, until finally it can be translated mechanically into the source code of a structured language. An advantage of the Tree is that one can undertake this whole top-down process with no need to change the form of representation.

The Tree can be understood by the user, analyst and programmer alike, so that each has some assurance that what the others are doing is consistent with what he is doing. Each can see his own contribution and how it affects and is affected by everyone else's. If a change in the intent of what is to be done occurs at the top of the Tree, corresponding changes are forced on the implementation below. The whole process from conception to program is represented with growing detail, maintaining an integrity that comes from working within only one expanding diagram.

Another example

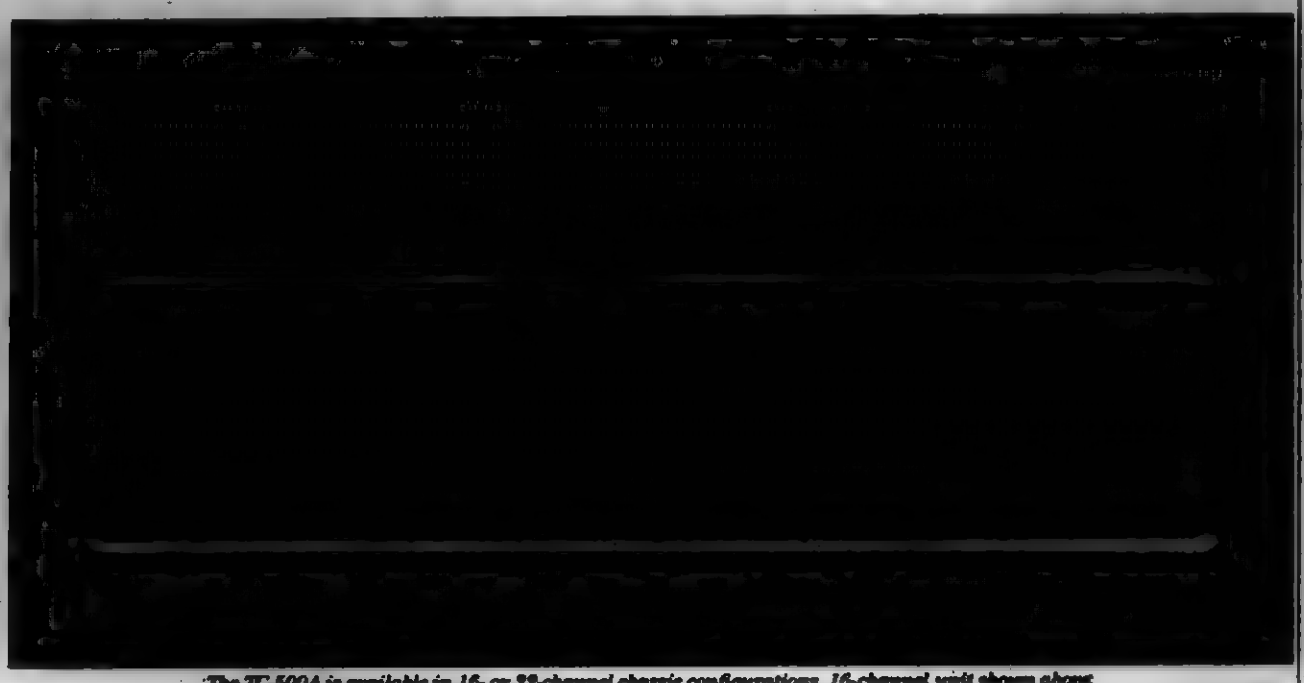
Figure 5 shows the beginning of the development of a payroll program. It shows how the top level of the program can be developed, leaving details until later.

In this example, the root tells us what the program is to do: "generate payroll." Then the branches are filled in to show how to do this. These details may not be known at first, so remarks are inserted showing what is to be accomplished, allowing the details of how it is to be done to be filled in later. The order in which these details are developed is at the convenience of the developers and need not follow the sequence in which the program executes them.

In the payroll program, the basic structure comes from processing matched records from two files until one of the files runs out of records. This process is shown by the UNTIL branch. There is an Initialize and a Finalize branch, but their details are deferred until the completion of the UNTIL subtree is worked out, at which time it is known what to Initialize and what to Finish.

Moving from left to right in the Tree shows *how* to do it, and moving from right to left shows *why* it is done. Moving from top to bottom of the limbs shows *when* it is to be done. Basic algorithms occur toward the top. Adaptations to specific environments occur toward the bottom. Modifications to accommodate the program to a new environment will usually affect only the bottom of the Tree.

Figure 3 also illustrates that branches can be interpreted as states, that is, the set of circumstances that exist at that point in the program. "Get Match" is a state in which a match exists between a transaction record and master record. When the subtree is exited through



The TC-500A is available in 16- or 32-channel chassis configurations. 16-channel unit shown above.

COMDESIGN INTELLIGENT STATISTICAL MULTIPLEXERS:

MORE FEATURES FOR YOUR COMMUNICATIONS DOLLAR

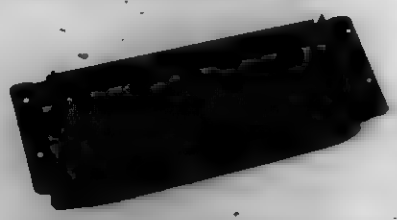
An attractive price and a long list of features make ComDesign's TC-500A Intelligent Statistical Multiplexer a great value. In fact, it would be hard to beat this multiplexer for data concentration, error control and throughput.

But that's not all.

The advanced intelligence of the TC-500A also gives you the complete system control you would expect only from an expensive network processor.

IT'S FLEXIBLE

Compatible with virtually any host computer, the TC-500A can connect up to 32 terminals, printers, personal computers, or other CPU's over one phone line.* With all the performance of a direct connection. Just select the exact channel configuration you need. The TC-500A supports all popular speeds, flow control conventions, and special character formats.



The TC-500A's unique firmware module, Flexpak, permits easy in-the-field software upgrades and access to latest ComDesign software releases.

Free application engineering and support is available to all customers from ComDesign's highly-qualified "data comm doctors."

EASY TO USE

The TC-500A is also surprisingly user-friendly. For starters, you never have to flip DIP switches or figure out complicated codes. As a matter of fact, the TC-500A is menu driven, in plain English. All commands are simply entered via the convenient front panel or through the supervisory CRT.

A NETWORK CONTROL CENTER TOO

The TC-500A's multiple microprocessor based architecture makes it powerful enough for network control and management functions. From either end of the network, you can monitor and test the entire system or its individual components, perform complete reconfiguration or change any operating parameter.

And, should anything ever go wrong, the TC-500A's extensive self-diagnostic capabilities make it easy to pinpoint the problem and effect immediate corrective action.

Add it all up, and we think you will agree, that the TC-500A will give you more for today's *and* tomorrow's communications dollar.

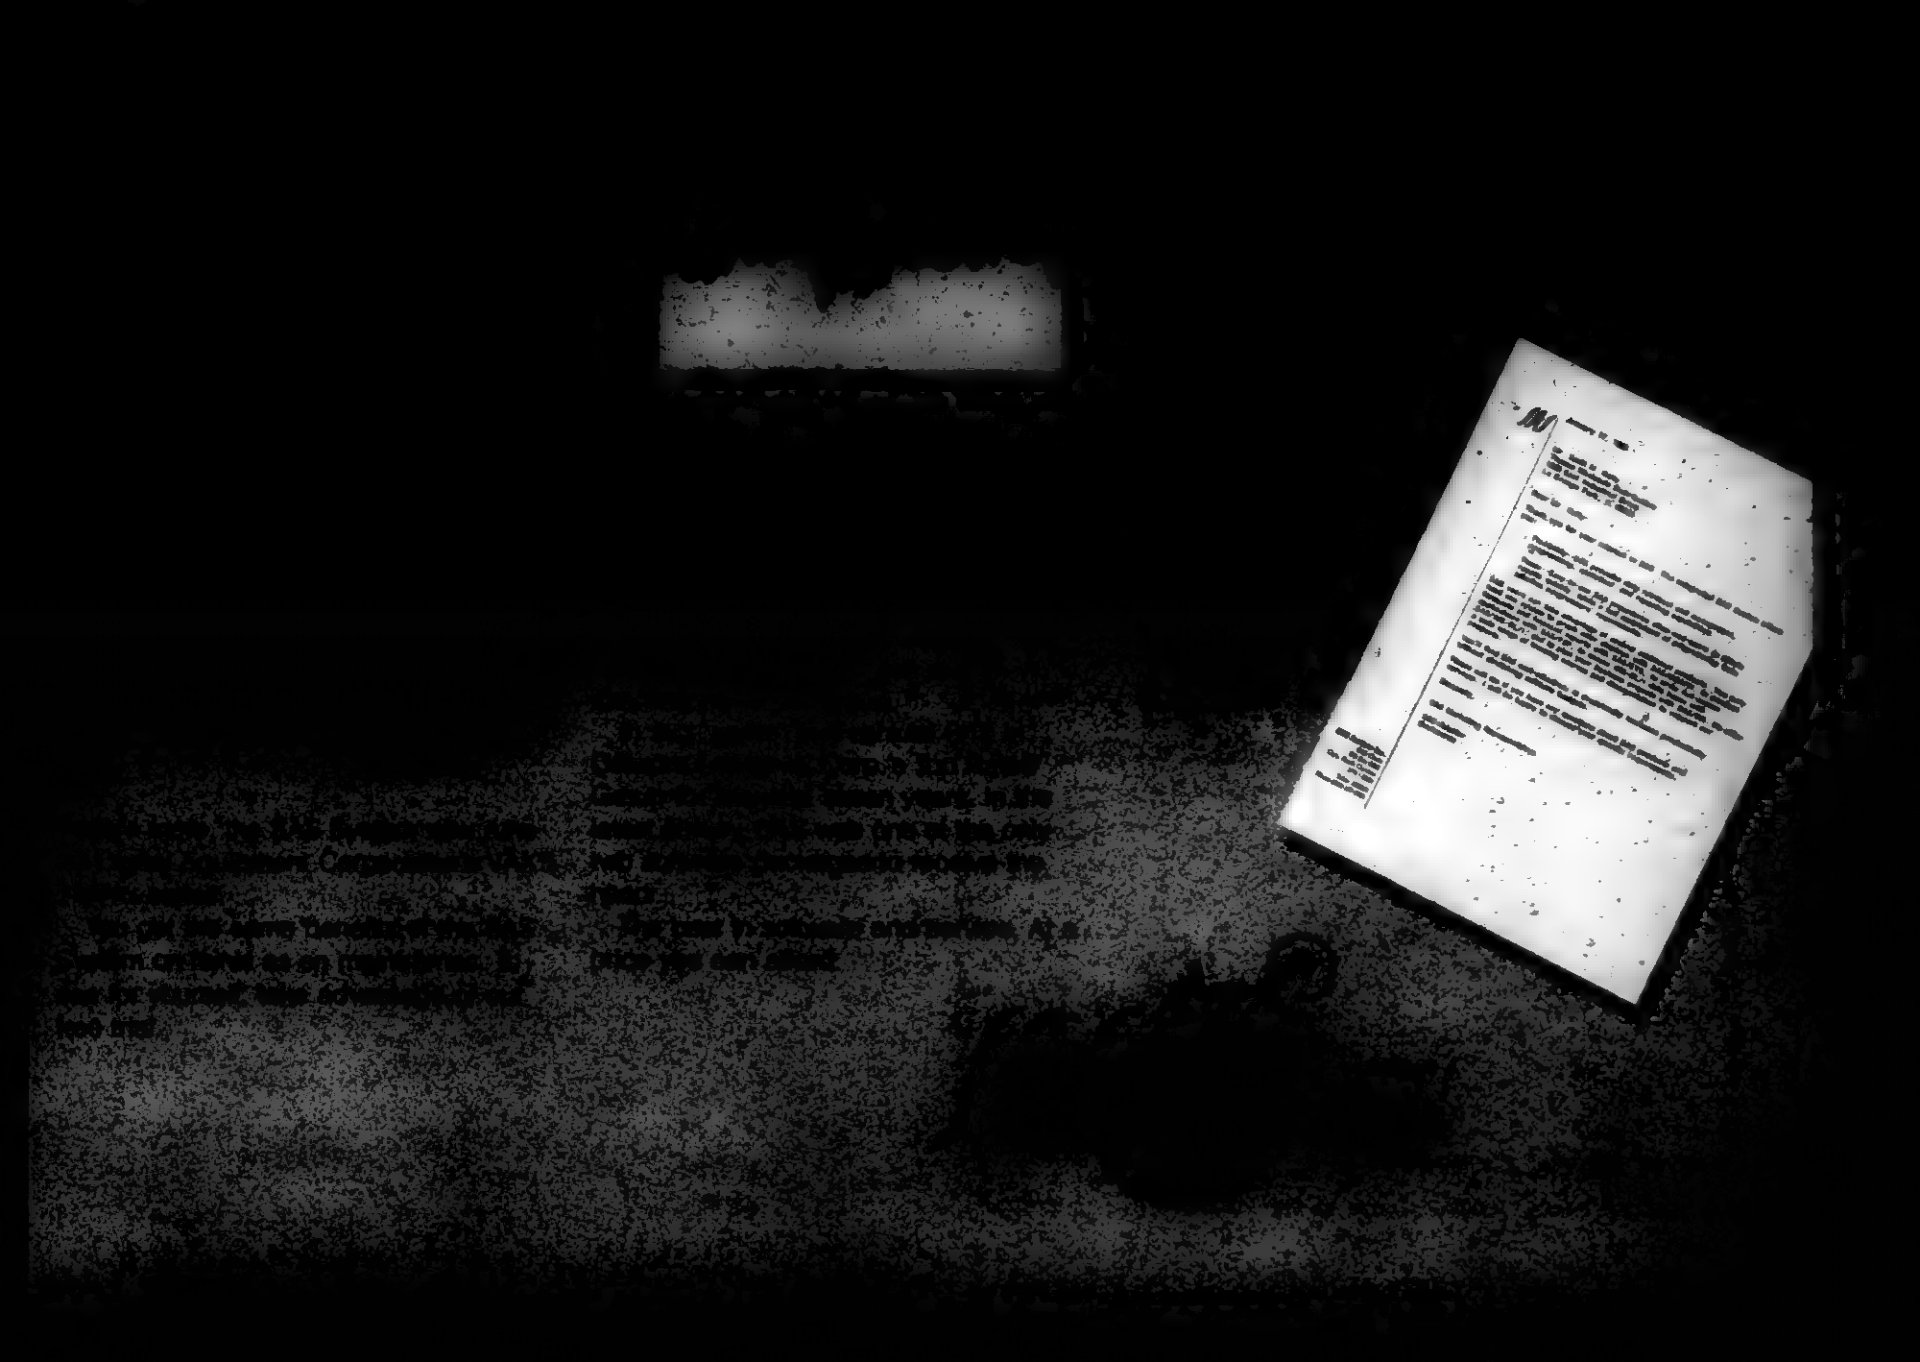
r Needs



Once the Tree is fully detailed, it becomes merely a mechanical process to have the Tree translated into a structured language, then compiled into an operating program. This process would not be possible if the Tree had not allowed a level of detail consistent with that required in the final program.

that branch, a match exists. Other parts of the program need to know that this match state exists, but need not know how it was produced. The details of how the match is made occur beyond the branch.

The Tree is like a management structure. At the top, everything is simple. At the bottom is the nitty-gritty. In between, the simple is matched to the nitty-gritty.

The major interfaces are defined at the top. They must be defined before the modules they tie together are designed. Any change in these interfaces will tend to affect everything below. Changes at the bottom are easier to make without affecting other parts.

The top represents the logical principles of, say, an accounts receivable system. The bottom represents the details of how the principles are applied to a particular physical implementation.

Tree editors

Trees become particularly useful when they are developed using a Tree editor. The Tree is then captured in a data structure as it is developed. The editor can then be asked to display or print out just those parts of the Tree or levels of detail that are desired. This capability makes the editor an interactive, living document, a great advantage over a dead piece of paper.

Once the Tree is fully detailed, it becomes merely a mechanical process to have the Tree translated into a structured language, then compiled into an operating program. This process would not be possible if the Tree had not allowed a level of detail consistent with that required in the final program.

Figure 5 shows how a subtree may be displayed on the editor screen. At the top of the screen is shown the sequence of parents leading to the subtree. Below is shown the subtree in indented form. Indented form is more compact for displaying on the screen. The user is in control of what part of the Tree he wishes to display or edit. He can also print out the Tree or any part of it in Tree form on a printer.

Structured design

Structured design focuses on developing programs that have low coupling (low data flow between modules) and high cohesion (parts working intimately together to satisfy a common goal within modules). The modules are our subtrees. Low coupling and high cohesion have been found to contribute to making programs easier to develop and to maintain. Changes in one module can only affect other modules through the data flows. Thus, keeping the number of data flows to a minimum makes it easier to keep track of the consequences of a change.

Data flows down the limbs. Next to the limbs we can show within parentheses the data elements that are produced above and used below that limb segment. (This finally explains the funny information in parentheses you were wondering about in Figure 2.)

The data flows shown on the

DOS/VSE and CICS/VS Frustration?

BIM gets it out of your system.

BIM presents a line of proven programs that maximize your system's capabilities, saving you time, labor and expense. These program products help get the most out of your system and people.

BIM-EDIT — the editor with more than 25 significant features that ICCF can't match.
BIMSPOOL — Prints output in POWER/VSE spooling queue on local or remote 3270 terminal printers. (Received ICP Million Dollar Award 1982).
BIMSPOON — On-Line to Batch Print Spooling. Prints data passed from CICS application programs into the POWER spooling queue.
BIM-PDQ — POWER Dynamic Queuing performance enhancement. Eliminates 85% of the I/O to heavily used POWER queue.
BIM-ODMS — Comprehensive problem analysis and display of operational CICS system.
BIMTEXT — Word processing, document composition system. Create formatted documents from free-form input.
BIMSWAP — Switch local 3270 BTAM terminals between multiple CICS partitions without special hardware or additional ports.
BIMCMPRS — CICS 3270 data compression system. Reduces response time for remote terminals significantly. Available for DB/VS1 and MVS also.
BIMP3270 — Comprehensive CRT screen image print facility. Copy to terminal printers or spool queue for system printer.
BIMSERV — On-line display of library directories and entries, VSAM Catalog entries, disk VTOC's, etc.
BIMDSLOG — Console Message File display. Used by computer operations and programmers.
BIMMONTR — DOS/VSE System Status, Performance Measurement, and POWER Queue display.
BIMDEVC — Displays Logical Unit assignments for physical devices, to resolve operational problems.
BIMSUBMT — On-line Job Edit and Submission facility.

BIM programs are cost-efficient, many less than $900, highest $4000. You can save even more with our group package offerings. Products are available on permanent, annual, or monthly leases, and shipped on a 30-day free trial basis. Product documentation is available on request.

BIM also performs systems programming consulting, with consultants based in Minneapolis and Washington, D.C. Computer time services are also available on our 4331-2 system, on-site or remote.

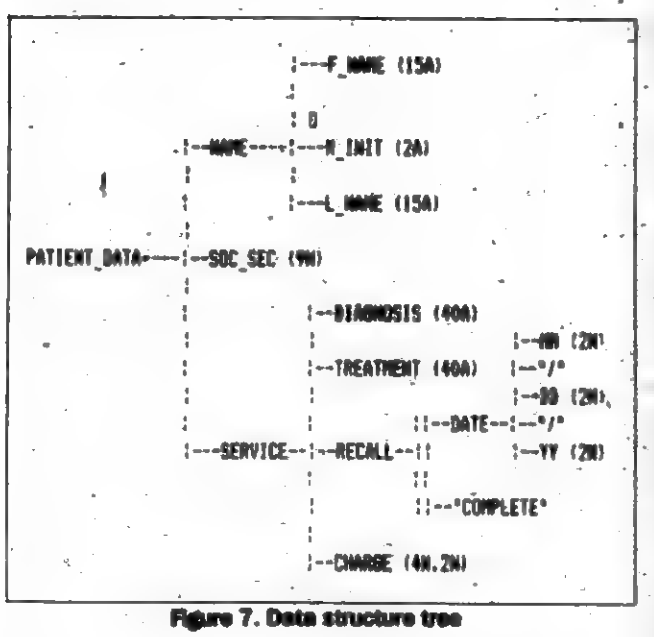

Figure 7. Data structure tree

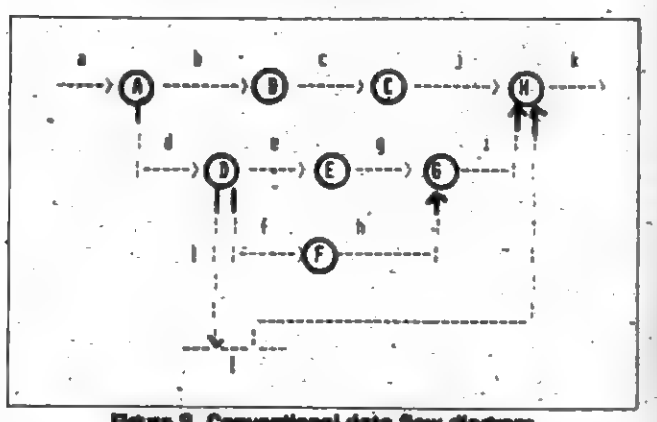

Figure 8. Conventional data flow diagram

limbs of the Tree make the coupling clear. A well-structured program will have a small volume of data flow on the high limbs (to the left), resulting in a low coupling between modules. Low coupling between modules results in high cohesion within the modules. Low coupling and high cohesion are opposite sides of the same coin.

Comparing the two versions of the same program shown in Figures 2 and 6, we can easily see that the program design in Figure 2 is better, having less data flow along the higher limbs, thus implying less coupling and consequently more cohesion.

Using the Tree and the following rules will generally produce good structured program designs:

1. Minimize the data flows on the high limbs.
2. Let the major decisions be made toward the top.
3. Keep the data and operations at the top logically clean and simple. Keep the dirty considerations about data structures on external media at the lower end of the Tree.
4. Introduce extra levels of limbs and branches as needed to keep from having too many branches exiting from any one limb.
5. Generally minimize the distance between where variables are initialized or first produced and where they are used.

Data structures

Note that the Tree helps us relate the control to the data structure to be used. Looking at Figure 4, we see that the "READ MAST" and "READ TRANS" branches deal with two records, each with their own information about an individual. The "GET MATCH" branch implies that the rest of the program may now deal with only one structure having all the necessary information about the same individual from both the master and the transaction records.

Figure 7 shows how a Tree can also be used to represent data structures. Here, O on a branch means "optional," "*" means "any number of times" and quotes enclose literals. Within parentheses is shown the number of numeric digits (N) or the number of alphabetic characters (A). Only one branch is taken off of a double vertical limb.

The Data Tree can be used to develop the Program Tree with the Warnier-Orr methodology. However, this technique will not be covered here.

Data flow diagrams

A data flow diagram shows the flow of data in a system. In a conventional data flow diagram, the bubbles represent processes and the arrows between the bubbles represent the data flows. Data storage is represented by a straight line (see Figure 8).

We have found a variant of the conventional data flow diagram to be very useful. We call this variant the two-entity data flow diagram. Processes are represented by rectangles rather than bubbles, and data flows are represented by ovals rather than labels on the arcs. Since the arcs no longer carry the data flow labels, they can now be used, when appropriate, to carry the conditions under which various data exits a process. A data flow going to more than one process is shown as an oval with multiple exiting arrows, rather than several arrows with the same label as in a conventional data flow diagram. Figure 9

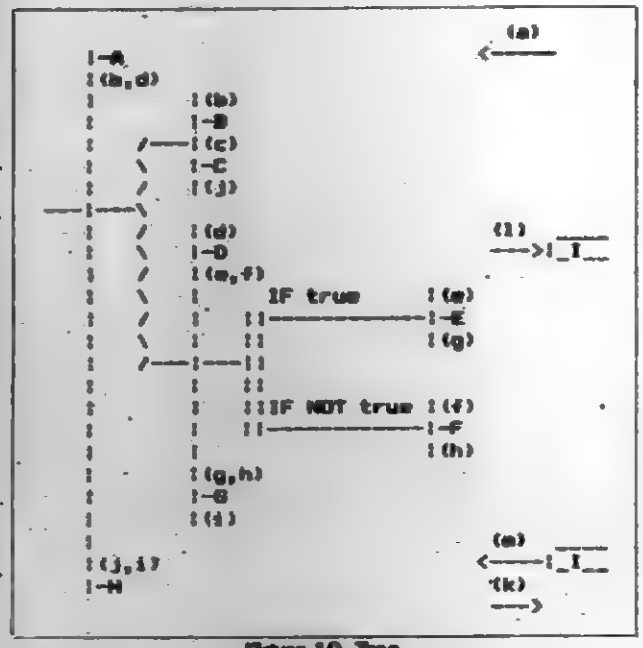

Figure 10. Tree

shows the two-entity data flow diagram corresponding to the conventional data flow diagram in Figure 8.

The two-entity data flow diagram has features that are similar to the Petrie diagram used to represent control systems.

The mathematician will see that processes are like operators; data flows are like operands. A process (operator) takes data flows (operands) as input and produces data flows as output.

Processes and data flows follow the sandwich rules: Between two processes there is a data flow, and between two data flows there is a process. We will see later how this observation makes it possible to represent a two-entity data flow diagram in the form of a matrix.

To be consistent with the sandwich rule, we represent a data storage as an open-ended rectangle. It has the same role in the sandwich as a process. Data can flow between a storage and a process. This approach treats a storage as a process that consumes or produces data, which is consistent with some modern thinking about data base machines.

The diagram can begin or end with either a process or a data flow.

One-page diagram

Data flow diagrams (either conventional or two-entity) for complex systems are developed as hierarchies. The whole system may be represented as a one-page diagram showing just the major parts of the system. Each of these parts is expanded in other diagrams. This expansion goes on until we have rectangles that represent sufficiently primitive processes that we are ready to program them. At this stage, we may wish to translate them to a Tree, an inconvenience we could avoid if we developed the whole system as a Tree. (But some customers prefer to see data flow diagrams rather than Trees.)

Figure 9 illustrates some of the rules for expanding the data flow diagram into more detailed diagrams. Each diagram should be simple enough that it can be easily understood without concern for distributing details. It can usually fit on one 8½-by-11-inch page.

Data flow diagrams (either conventional or two-entity) for complex systems are developed as hierarchies. The whole system may be represented as a one-page diagram showing just the major parts of the system. Each of these parts is expanded in other diagrams. This expansion goes on until we have rectangles that represent sufficiently primitive processes that we are ready to program them.

Each process rectangle in each diagram is numbered and can be expanded into another diagram. The diagram will have the same number as the process rectangle it represents. A decimal number system is sometimes used to keep track of which process is the expansion of which other process. For example, 4.3.6.2 would be process 2 in the diagram expanding 4.3.6.

A diagram that is the expansion of a rectangle has a boundary drawn corresponding to the boundary of that process rectangle in the higher level diagram. Outside this boundary are just the immediate inputs and outputs of this process, as shown in the higher diagram. Within this boundary is the expansion of the process. At each level of expansion, all the inputs and outputs that appear at the higher level must be accounted for. This expansion is repeated until the remaining processes are sufficiently primitive that they need no further expansion to be understood and programmed.

Note that hierarchy is shown in the data flow diagrams by a set of diagrams. In the Tree, the hierarchy is shown naturally as the branching of the Tree.

In the literature developing conventional data flow diagrams, this hierarchical development is referred to as "partitioning." This application of the word, however, is quite contrary to the way

EVERY YEAR WE REMANUFACTURE THOUSANDS OF DISC HEADS PEOPLE ALMOST GAVE UP ON.

There's no need to give up on a crashed disc head. Infoextend can remanufacture most heads and have them perform "like new." Infoextend products are part of Information Magnetics Caribe, the world's largest manufacturer of rigid media disc heads.

We remanufacture heads using the same components, and test with the same equipment as on our new head manufacturing line. The result—a remanufactured head with new head performance, without new head cost. Don't give up on your crashed heads, send them to us. We'll make them perform "like-new."

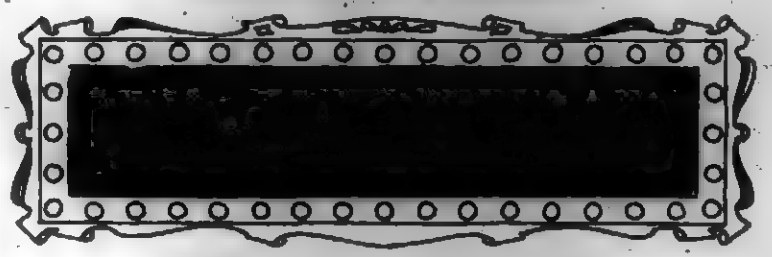
Call (800) 468-2000 for the name of the distributor near you.

INFOEXTEND PRODUCTS

Infoextend Products are made by Information Magnetics Caribe Inc. A subsidiary of CCI.

THE HIGH-TECH KICKOFF FOR '84

Norm DeNardi Presents



Thursday, April 19, 1984 ■ Hours: 12:00 to 6:00 PM
4290 El Camino Real, Palo Alto, CA

Be a part of the industry and meet today's leaders and tomorrow's innovators at the California Computer Show one-day exhibition.

A unique showcase of high technology products specifically designed to attract OEMs, sophisticated end users, dealers, and distributors.

Featuring the latest hardware and software trends, the California Computer Show highlights:

- Computers
- Engineering workstations
- Electrostatic Printers
- Graphics Systems
- Networks
- Disk Systems
- UNIX and other Software Development Tools
- Leading Peripheral Manufacturers

The California Computer Show merges the technical disciplines: corporate issues; technical considerations; industry trends, and promises for the future.

JOIN TODAY'S LEADERS AND TOMORROW'S INNOVATORS AT THE CALIFORNIA COMPUTER SHOW.

Norm De Nardi Enterprises
269 So. San Antonio Rd., Los Altos CA, 94022 (415) 941-8440

"partitioning" is used in other literature, that is, to draw boundaries to separate parts into distinct sets. We prefer the term "detailing" rather than "partitioning" for expanding the processes into more detailed processes. The term "partitioning" would better describe the reverse process, starting with a large diagram and partitioning its parts to develop a higher level diagram.

The data flow diagram emphasizes data flow, but the flow of data has implications on the flow of control.

The Tree emphasizes the flow of control, but the data flows can be shown on the limbs.

By putting information about flow of control in the data flow diagram, and information about flow of data in the Tree, the two are drawn closer together, making it easier to make the transition from one to the other.

Note that it is not necessary to show the control in the data flow diagram, nor the data flow in the Tree. These can be left out for a high-level view where it is felt the added detail would be confusing. But, it is possible to add this information when appropriate without having to go to a different type of diagram.

The most versatile and least expensive printer for your IBM 3270 system isn't an IBM.

It's the ISI 487 that's cutting the cost of IBM on-line printing, delivering features that IBM can't match, and making a lot of people very happy. This plug-compatible, fully integrated (no box!) replacement for the IBM 3287 carries a price tag as low as $3,350 and offers you:

- outstandingly quiet operation
- 200 CPS dot matrix and 50 CPS NLQ printing
- continuous forms and cut sheet handling
- full SDLC/SCS support

For more information about the ISI 487 and our complete line of IBM compatible printers, call, write, or TWX us today!

China Computerworld 电脑世界

The only specialized computer publication written exclusively for the People's Republic of China (PRC).

The PRC is a huge country which now has a rapidly growing installed base of computers. And the future looks very bright for the Chinese EDP market.

Government plans call for extensive use of computers in the PRC's technological modernization, and annual EDP expenditures are expected to grow into the billions of dollars in the 80's.

A good deal of this money will be spent on foreign computer equipment and the purchase decision-makers for this equipment will be using *China Computerworld* to help them choose the products and the companies they need.

China Computerworld is a joint venture of the Fourth Ministry of Machine Building and CW Communications/Inc. Its 50,000 subscribers include the key government officials and computer managers who have EDP purchase decision authority.

China Computerworld is published on the fifth and twentieth of each month. Its tabloid newspaper format gives you a unique opportunity to introduce your products and services to this awakening giant of a marketplace.

CW International Marketing Services Department gives you one-stop advertising service in countries around the world. For more information about *China Computerworld* or any of our other foreign publications, just fill out the coupon below..

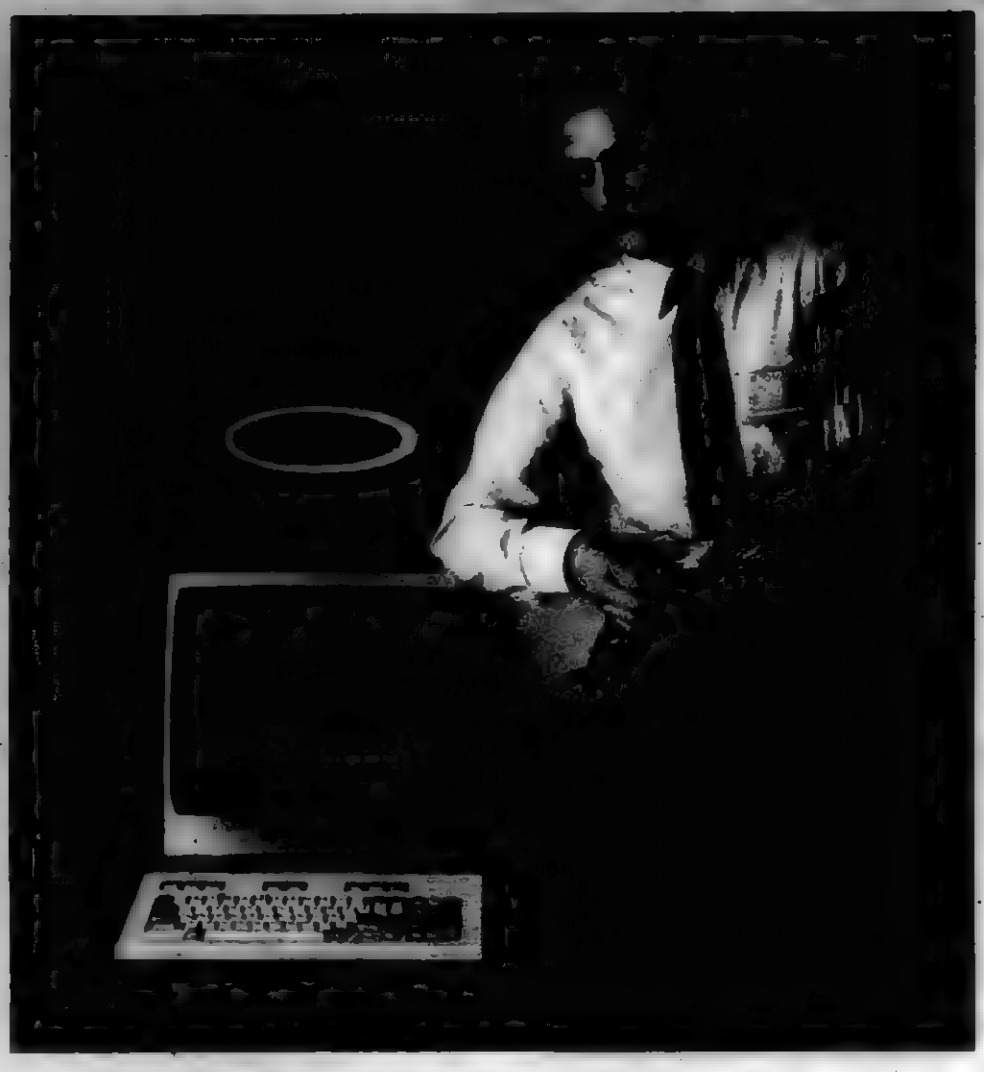
HOW THE TERMINALS THAT GIVE YOU SO FEW PROBLEMS CAN WIND UP GIVING YOU NONE AT ALL.



While we at Teletype Corporation like to talk about our terminals' remarkable record for reliability, we have to admit that every once in a while you just might have a problem with one.

But if you contract with Teletype's Product Service Organization, getting good service is no problem at all. That's because no one can service our full line of CRTs and teleprinters as well as our service technicians. Each one of them is a company-trained, job tested professional who must continually meet our expectations—and yours.

Help is never more than a phone call away since our technicians are on-call 24 hours a day, 7 days a week. And with our network of 100 offices nationwide, we're able to provide fast response time, even to remote areas. You can contract with us for response times as low as 2 hours, or less, as your needs dictate.

But at Teletype, we feel there's something more important than fast response time. And that's fast restoral. So when our technicians call on you, they'll have the necessary test equipment and original Teletype® parts to get your terminals up and running in no time flat.

We'll even help solve problems before they occur with scheduled preventative maintenance. You can also choose our installation service option that includes everything from getting your terminals on-line to user orientation. It's all a part of our Full Service Maintenance Agreement.

So to keep your problems from becoming big problems, write Teletype Corporation Product Service Organization, 2330 Eastern Ave., Dept. 2800-A Elk Grove Village, IL 60007. Or call toll free at 800-323-4226, ext. 300. (In Illinois, 1 800 942-4192, ext. 300.)

IN DEPTH/TALE OF HOPE

The data flow matrix pulls a great deal of information about the system together in one place so that it can be analyzed for consistency and completeness. The matrix can be used to trace the effect of a change in a data element through the whole system. The matrix can also be used to make estimates of processing volumes and times.

The data flow diagram may imply that more than one process can go on at one time. In Figure 8, B and C can occur simultaneously with D, E, F and G. When programming with just one CPU, the programmer can make an arbitrary choice of which to do before the other. Modern applications more and more involve multiple control units that allow processes to be done simultaneously.

The relation between the two-entity data flow diagram in Figure 9 and the Tree in Figure 10 (on ID/12) can be readily seen. The processes are represented in the data flow diagram as rectangles and in the Tree as branches. The data flows appear in the data flow diagram as ovals and in the Tree as data flows on the limbs. Parallel processes are shown in the data flow diagram with multiple arcs exiting from the same process and in the Tree with wiggly limbs. Figures 9 and 10 demonstrate the relations between the two.

Note that in a two-entity data flow diagram, conditions can be shown at the exit of the process. This must be shown in the Tree in two steps: as the process followed by the decision, as is shown in Figure 10.

While data flows within the system are shown on the limbs, data flows into and out of the system are shown along branches entering and exiting at the leaves.

Where double or wiggly limbs obscure the data flow in or out of a process, a short limb, called a stub, is added to carry the data flow. For example, the data flows in and out of E, e and g, respectively, are shown on the stub above and below E.

Data flow matrix

We can develop a data flow matrix corresponding to a two-entity data flow diagram. In the matrix, the rows represent processes and the columns represent data flows. We use O's and I's to show where a data flow is the output or input of a process. Figure 11 (on ID/13) shows the data flow matrix for the two-entity data flow diagram shown in Figure 9.

The On's represent the conditions under which various output data flows are produced; for example, in Figure 11 the 01 represents the output under the condition True, the 02 under the condition not True.

The In's show the conditions under which the execution of a process is triggered to start by the presence of input data. If all the inputs are simple I's, then the process is triggered when all the inputs are available. If there are numbered inputs, then the process is triggered when all the inputs of any one number are available. For example, in Figure 11, it shows that G is triggered when it gets either g or h, and H is triggered when it gets both i and j.

The data flow matrix pulls a great deal of information about the system together into one place so that it can be analyzed for consistency and completeness. The matrix can be used to trace the effect of a change in a data element through the whole system. The matrix can also be used to make estimates of processing volumes and times, as discussed below.

We can also represent a data element dictionary as a matrix, called a data element matrix. Let the columns

TSO USERS

Compare these features:

- Up to 50% less overhead than SPF
- Full-Screen Editor (LRECL up to 4096)
- Data Set Manager (Controls TSO files)
- JES Sysout Previewer (Direct from JES Spool)
- File listing facility (LRECL up to 32760)
- Programmable function keys
- Split-Screen facility (Two fully-active screens)
- Customer-defined exit facility (Controls all FSE+ functions)
- FSE+ tuning parameters (Optimize performance)
- Structured menus for new users
- Command oriented for experienced users
- MVS 3.8, SP and XA support
- Free trial period

Who's sold more printers to American business?

Epson.

Actually, we've not only sold more printers to American business, we've sold more printers to America.

Which brings up some very important reasons why Epson is the printer for your business.

Standard equipment.

Virtually every microcomputer made is Epson-compatible. Which means manufacturers make their computers to work with our printers, because Epson printers are not only the world leaders, they're the world standard.

The reason why.

We sell more printers, because we make better printers. Our features are consistently one step ahead of the competition. Our quality and value have never been equalled. And our reliability rates are second to none.

Another reason.

Epson printers are stocked by more computer stores in more places than any other brand. Which means if you ever have a problem—and you probably won't—we'll be there.

Your next printer.

It can be very confusing buying a printer nowadays. But it needn't be. If you want the features, the reliability, the quality, the value, just remember one thing.

Epson.

Number one. And built like it.

EPSON

EPSON AMERICA, INC.
3415 Kashiwa Street
Torrance, California 90505

The Epson FX-100™ can print spreadsheets in correspondence-quality type at 160 characters per second. To see it and the entire line of Epson high-performance printers, call (800) 421-5426 for the dealer in your area. In California, call (213) 539-9140.

Epson is a registered trademark and FX-100 is a trademark of Epson America, Inc.

VM/SP Graphics Users

Tired of playing roulette with your graphics environment?

SAS/GRAPH® and GDDM users can now spool and manage graphic printouts through the ACX-PM™ Printer Manager as if they were normal listings. Remove dependence on operators, decrease printer contention, and increase user control. ACX-PM supports 3287 graphic printers for both text and graphic printing.

The worksheet shows the number of characters in each record of a data flow or file (computed from the data structure matrix). The total number of records of a data flow processed per day can be computed by summing the frequencies of all the processes that use that data flow. Each frequency must be multiplied by the percent of the time that process produces this output.

represent data flows and files, and let the rows represent data elements. A mark then shows where a data flow or file contains a specific data element. For each data element, its format and its size in characters are shown (see the lower part of Figure 11).

These two matrices, the data element matrix and the data structure matrix, have been put together by making the data flows in the columns of the data flow matrix and the data element matrix correspond. Together they form the data structure matrix of Figure 11.

Worksheet

Additional information has been added to Figure 11. For each process that is triggered externally, the figure shows what triggers the process and how often it is triggered. For each process, it is shown how long it takes from when a transaction enters the queue for that process until it is completed.

Working from the frequencies of these external triggers and how the data flows within the system trigger processes, the frequencies of all the processes can be computed. (Data flows trigger processes, but data files do not.)

Figure 12 (on ID/13) is a worksheet. The worksheet shows the number of characters in each record of a data flow or file (computed from the data structure matrix).

The total number of records of a data flow processed per day can be computed by summing the frequencies of all the processes that use that data flow. Each frequency must be multiplied by the percent of the time that process produces this output.

For example, if a process is triggered 100 times a day and the condition on the output shows it is produced 5% of the time, then this output is produced five times a day, on the average. (We might also show in the matrix whether each time the process is triggered one record or all the records of the data flow or file are processed. Here we assume only one record is processed.) The timing can be determined by critical path calculations.

The matrix can be maintained in a data base. The data base maintains the worksheet calculations. As changes are proposed, it shows the resulting changes throughout the system. It thus becomes a requirements analysis decision support tool.

Supermini offers IBM compatibility

By Patricia Keefe
CW Staff

TRUMBULL, Conn. — Cannan Computer Corp. today unveiled a multiuser superminicomputer said to offer mainframe power and applications designed to run under IBM's VM/CMS operating system.

An extension of the firm's year-old Personal Mainframe Series 5000 single-user processor, the Multiuser Personal Mainframe 5800 series can support up to eight users either through a Xerox Corp. Ethernet-based local-area network or as a cluster of 5800 series terminals linked over telephone lines. The 5800 series also offers multiple windowing and the ability to run and control multiple applications simultaneously on one terminal, a spokesman said.

Available in April, the 5800 series features a two-bus architecture that includes Cannan's 32-bit central processor, which is said to execute an IBM 370 instruction set. Motorola, Inc. 68000 microprocessors are also used for I/O and communications processing, the vendor said.

The 5800 series runs on Cannan's updated, proprietary version of IBM's public-domain CMS Release 6, which provides an IBM-compatible user application interface. The user reportedly does not need an IBM mainframe or IBM's VM/CMS to run CMS applications. Users who want to be 100% compatible with IBM's systems software can purchase one IBM license per system, a spokesman said.

The Model 5822Z system console contains the 32-bit main processor, 1M byte of error-correction code (ECC) memory (expandable up to 4M bytes), an 85M-byte Winchester disk drive, the eight-port communications controller board and six Intel Corp. Multibus slots for system expansion. The system is compatible with current Cannan Personal Mainframe Series 5000 capabilities. Also supported are both data communications and data terminal equipment.

IBM 3270 support

Standard features reportedly include 8M bytes of virtual memory, an editor, a window graphics system, support for IBM 3278 Model 2 terminal emulation, a Centronics Data Computer Corp. parallel printer interface, a 1,200 bit/sec internal modem for remote diagnostics and two software packages — Cannan's proprietary kernel operating system and CMS compatibility. The latter allows the user to run CMS applications without conversion, according to the spokesman for the vendor.

Cannan expects to have 40 software packages certified for the 5800 series' April debut. After certification, Cannan and the vendor will sign marketing agreements to price the software on Cannan's systems at 5% to 10% of the license fees charged for mainframe installations.

For example, Information Builders, Inc.'s Focus costs $120,000 for a mainframe license, but only $6,500 on the Cannan system. Those packages are said to include popular data base management, decision support, business graphics and statistical analysis systems.

The Model 5822Z costs $24,900. The two software packages cost $1,850, and each Ascii terminal costs $1,500, according to the vendor. An eight-terminal configuration costs $79,250 and includes 4M bytes of ECC memory, 170M bytes of disk storage, a 1,600 bit/in. tape drive and the software. The spokesman said the 5800 series offers a per-user cost of about $10,000.

Additional information can be obtained from Cannan, which is located at 39 Lindeman Drive, Trumbull, Conn. 06611.

Wang adds two systems to VS85 supermini line

LOWELL, Mass. — Wang Laboratories, Inc. has announced two packaged configurations of its VS85 line of 32-bit superminis aimed at the small and medium-size office.

Featuring differing capacities of internal disk drives, the newly announced models are the VS85-76F and the VS85-147F. Both systems incorporate the same basic configuration, including: a model VS85-1 processor with 1M byte of main memory, a 16-port serial I/O processor, an archiving workstation, a bus adapter, Wang's VS operating system, assembler language, a disk I/O processor capable of supporting two disk drives, a communications I/O processor capable of supporting three data link processors and a compiler, the vendor said.

The VS85-76F includes the 76M-byte, 8-in. internal fixed disk drive currently available on the VS25 and VS45 systems. The VS85-147F has been configured with a new product, a 147M-byte, 8-in. disk drive. Each disk drive is housed in the VS85 cabinet.

The packaged VS85 systems were designed for offices that require the processing capabilities of the firm's VS100 CPU in applications supporting up to 64 users. Because the disk drives are built into the cabinets, the systems do not require special adjustments for an office environment.

Both VS85 packaged sys-

See WANG page 79

Fault-tolerant superminis offer Unix support

SAN JOSE, Calif. — Tolerant Systems, Inc. has announced the Eternity series of fault-tolerant, 32-bit superminicomputers. The systems were designed to use a version of the Unix operating system.

Designed for use in on-line transaction processing applications, the system reportedly offers performance comparable to Digital Equipment Corp.'s VAX-11/780 superminicomputer. The Eternity series consists of from one to 15 system modules called system building blocks (SBB). The SBBs are connected by a passive coaxial cable called the system interconnect bus, the vendor said.

Any SBB within the system can perform one or more distributed system tasks such as application processing, file serving or communications serving. Each SBB can contain from 1M to 16M bytes of random-access memory. Internal processors, such as a user processing unit and a real-time processing unit, are based on National Semiconductor Corp.'s NS32032 microprocessor. Each SBB contains two 32-bit processors, the vendor said.

One of the benefits of the Eternity system, the vendor claimed, is that the configuration of SBBs can be redefined to suit the application. For example, a system requiring heavy I/O traffic could focus more SBBs to file serving instead of applications processing. In addition, if more processing capacity is required, additional SBBs reportedly can

TERMINALS

THOMAS ENGINEERING CO.
TE-780XB; TE-780XV; TE-780XA

Thomas Engineering Co. has introduced three terminals with multihost protocols.

The TE-780XB is a stand-alone, synchronous model that emulates Honeywell, Inc.'s VIP 7800 terminals, including the VIP 7814. The TE-780XV offers an operator-selectable Digital Equipment Corp. VT100 CRT terminal personality for environments requiring both Honeywell and DEC protocols. The TE-780XA is an asynchronous model, which, when combined with a protocol converter, provides emulation of IBM's 3270 or Honeywell's VIP 7700 terminal.

All models include a 14-in., non-glare-screen; a tilt-and-swivel monitor; and a detachable, low-profile sculptured keyboard. More than 60 menu-selectable setup options and an auxiliary printer port are standard.

The TE-780XA is priced at $1,695; the TE-780XB and TE-780XV are priced at $1,595.

Thomas Engineering, 1040 Oak Grove Road, Concord, Calif. 94518.

TELERAY, INC.
10GRF/APL

Teleray, Inc. has introduced a terminal that offers presentation graphics, APL capability and text editing features.

The Ansi X3.64-compatible unit, called the 10GRF/APL, has a transparent printer port through which data is transmitted. Its graphics and editing memories are independent of each other, the company said.

In the graphics mode, the terminal is compatible with the Tektronix, Inc. 4010/4014 and Plot 10. The APL mode can be accessed by entering a shift out code, the company said.

The standard 12-in. model terminal sells for $2,940. Terminals are also available in 9- and 15-in. styles.

Teleray, 6425 Flying Cloud Drive, Eden Prairie, Minn. 55344.

TANDBERG DATA, INC.
TDV 2200 price reduction

Tandberg Data, Inc. has announced a 25% price reduction for its TDV 2200 series smart terminals.

The single-unit price of the terminals has been reduced from $1,875 to $1,395. Quantity discounts are available to large users, OEMs and systems integrators, a vendor spokesman said.

Tandberg Data, P.O. Box 80, Labriola Court, Armonk, N.Y. 10504.

FALCO DATA PRODUCTS, INC.
Fame 78

Falco Data Products, Inc. has introduced a terminal designed for the IBM 3270 terminal environment.

The Fame 78 is an Ascii terminal that emulates Beehive International, Inc.'s Model 78 terminal. The vendor's terminal features a green phosphor, 24-line by 80-col. display. Other standard features include a 12-in. screen, tilt-and-swivel design, microprocessor-controlled logic board and a CRT control circuit for a separate synchronous/video CRT monitor, according to a vendor spokesman.

The Fame 78 features two RS-232C ports for host communications and local printer communication. Each port is bidirectional and offers user-selectable rates ranging from 300 to 9,600 bit/sec, the spokesman said.

The terminal is said to have an IBM 3278-type keyboard, with 24 preset function keys and special IBM status line characters. Optional features are an amber tube and a 14-in. CRT screen.

The Fame 78 with a 12-in., green phosphor screen is priced at $995.

Falco Data Products, 1266 Lawrence Station Road, Sunnyvale, Calif. 94089.

PLASMA GRAPHICS CORP.
Plasmagraphics 120

Plasma Graphics Corp. has introduced what it claims is the first full-size, flat-panel display using ac and dc plasma-discharge display technology.

The Plasmagraphics 120 is a 25-line by 80-char. display said to combine a slim profile, readability and graphics-quality resolution. It is said to provide 120,000 addressable pixels arranged in 480 col. by 250 rows.

All electronics necessary to address and time the display are housed on an integral panel-driver board. The display color is bright orange, according to a spokesman.

Volume production of Plasmagraphics 120 panels will begin during the second quarter of 1984. Evaluation units are available at $1,795, and the sale price per unit will begin at under $1,000, the vendor spokesman said.

Plasma Graphics, P.O. Box 4002, Warren, N.J. 07060.

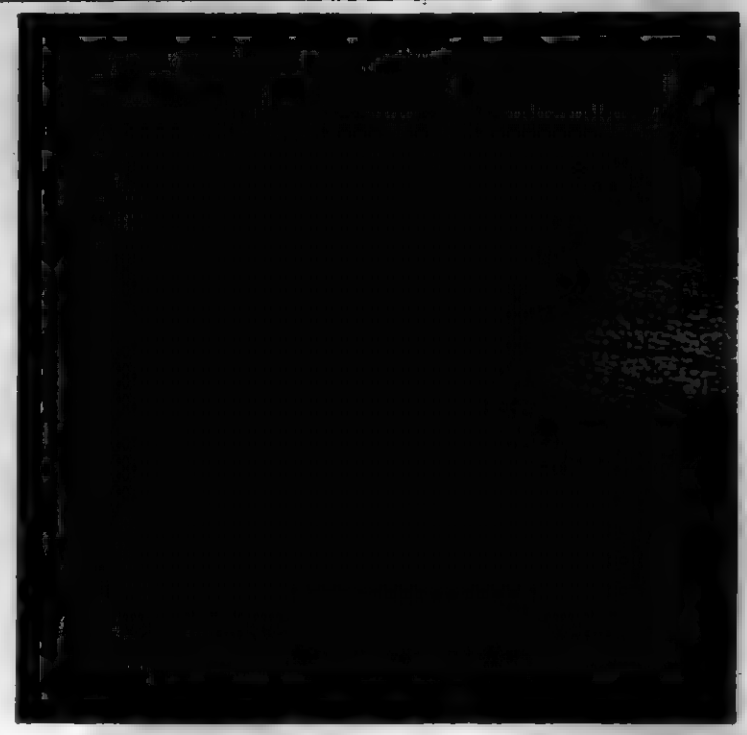
MICRO-TERM, INC.
Ergo 4000 upgrade

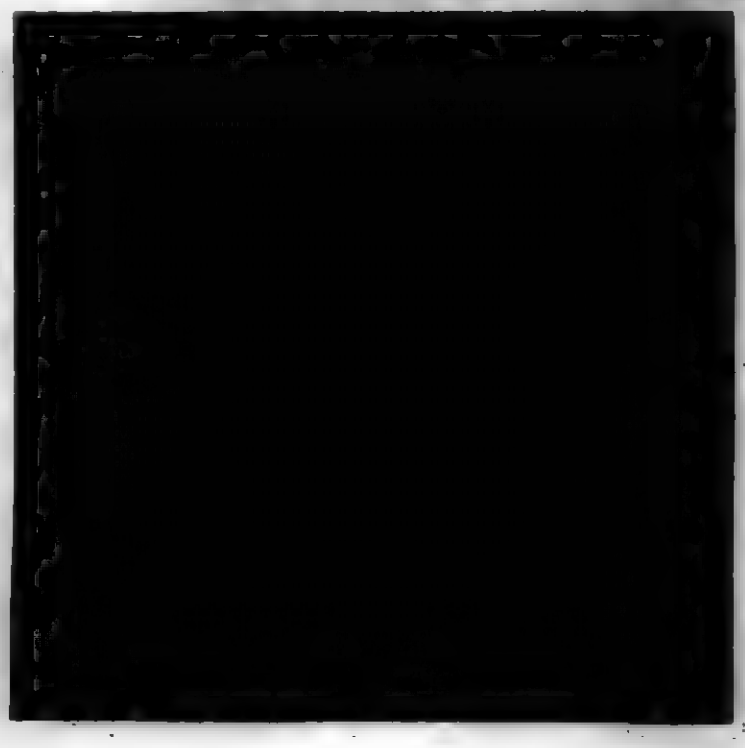
Micro-Term, Inc. has announced an upgraded version of the Ergo 4000 word processing terminal.

The terminal's character generator has been upgraded to include 128 math and scientific characters in addition to the standard 128 Ascii characters. Also improved, according to the vendor, is the unit's character generation facility. It is clearer and more readable now, the vendor said.

Micro-Term also announced that it is offering Lexisoft, Inc.'s Spellbinder word processing package to all Ergo 4000 purchasers for $295. The upgraded Ergo 4000 costs $1,195, a spokeswoman said.

Micro-Term, 512 Rudder Road, Fenton, Mo. 63026.





Whether you're looking for Payroll, Personnel, Pension Administration or Claims Processing software, Information Science's "Whole Person" software gives you a comprehensive system that provides superior technical features.

Systems for both Database and Non-Database

InSci's state-of-the-art payroll/personnel database system is integrated into a number of database management environments—including IMS, DL-1, and IDMS. Native mode, the system is designed to take full advantage of each specific database structure, eliminating clumsy, resource-draining interface programs.

In addition, InSci offers two non-database systems. One using a sequential file structure, the other using a VSAM access method.

Introducing On-line PAS

PAS–InSci's new Pension Administration System–is available as a complement to our payroll/personnel package or as an independent, stand-alone system. PAS automates most aspects of pension administration from ERISA reporting and compliance to benefits calculation, retirement counseling, vesting schedules and benefits statements.

Software for Health Insurance Claims

Our health insurance claims processing system permits your organization to self-administer group health, dental, and disability claims–providing significant cost savings while achieving fast, accurate claims turnaround.

The Complete Human Resource Package

We call it "Whole Person" software because it is the most comprehensive, technically advanced set of human resource systems avail-

SYSTEMS & PERIPHERALS

INNOVATIVE ELECTRONICS, INC.
MC-80/600-8

Innovative Electronics, Inc. has introduced a protocol emulator device that reportedly allows users of Televideo Systems, Inc.'s 920, 925 or 950 terminals to emulate IBM 3277 and 3278 terminals.

The MC-80/600-8 emulator communicates with an IBM host using 3270 binary synchronous communications protocol, according to a spokesman for the vendor. In addition, it is said to emulate a 3270 controller with one or two ports available for any combination of display stations or printers.

Other capabilities of the device include replacing or multidropping with IBM 3271 Models 1 and 2, IBM 3276 Models 1 and 2 or IBM 3274 Model 51C control units, the spokesman said.

When attached to the emulator, the Televideo terminals reportedly are driven as fully functional 3277/3278s with screen sizes of 12 by 40, 12 by 80 or 24 by 80, the company said.

The emulator reportedly provides up to 16K bytes of read-only memory, 16K bytes of random-access memory as well as three serial communications ports.

The device, with one binary synchronous communications port and a CRT or printer port, is priced at $1,495. A two-port configuration costs $1,695, according to the company.

Innovative Electronics, 4714 N.W. 165th St., Miami, Fla. 33014.

PRINTERS/PLOTTERS

INNOVATIVE ELECTRONICS, INC.
Innovator 202-PC

Innovative Electronics, Inc. has announced extended communications interface capability for the company's Innovator 300 line/min printer. The Innovator 202-PC reportedly provides IBM 2780/3780 emulation facilities with its built-in printer and Ascii terminal port.

Features supported include: space compression/expansion, processor interrupt reception, conversational mode, reception of Ebcdic transparent data, component selection, vertical format control and horizontal format control. Additional features of the product include: processor interrupt transmission, switch-selectable 2780/3780 modes, switched network/leased line control, auto-answer, switch-selectable Ascii/Ebcdic modes and extensive built-in diagnostics, the vendor said.

The printer system is controlled by a microprocessor-based, single-board computer system. The programmable controller is used to implement communications protocols, a vendor spokesman said. The price of the 132-column printer is $5,495.

Innovative Electronics, 4714 N.W. 165th St., Miami, Fla. 33014.

TELEX COMPUTER PRODUCTS, INC.
Telex 387

Telex Computer Products, Inc. has introduced a table-top matrix printer that is said to be compatible with IBM's 3287 printer.

The Telex 387 printer reportedly features 400 char./sec printing speed and complete plug compatibility for attachment to an IBM 3274/3276 terminal or Telex control unit. No system or controller changes are required to operate the Telex 387 within an IBM environment utilizing 3287 printers, a vendor spokesman said.

The 387 features a near letter-quality print option. Its standard print mechanism forms an 8- by 7-dot matrix reportedly capable of printing on up to six-part forms with a total thickness of .027 in. An optional print head mechanism with staggered wires, 16- by 14-dot matrix outputs and near letter-quality printing is available, the spokesman said.

A maximum of 136 print positions at 10 char./in and up to 233 print positions at 17.1 char./in are available.

The 387 is available now for $7,200.

Telex Computer Products, 6422 E. 41st St., Tulsa, Okla. 74145.

PRINTRONIX, INC.
MVP 150B

Printronix, Inc. has introduced the MVP 150B, a dot matrix printer designed for microcomputer networks.

The multimode printer works at a speed of 80 line/min in a letter-quality mode and 300 line/min in a dot matrix mode, the vendor said. The printer can reportedly use six-part paper with widths varying from 3 to 16 in. It supports software that expands or condenses print sizes; for example, a 132-col. report can be printed on 8½-by 11-in. paper, the vendor claimed.

The printer costs $3,745.

Printronix, 17500 Cartwright Road, P.O. Box 19559, Irvine, Calif. 92713.

POWER SUPPLIES

DATAPOWER, INC.
DPX-51

Datapower, Inc. has announced an open-frame, printed-circuit board switching power supply, the DPX-51, which reportedly has four outputs and provides up to 40W of continuous power.

The DPX-51, the vendor said, has input ranges of 90 to 132 Vac or 180 to 264 Vac that provide brownout protection and that are user-selectable. Output current levels can re-

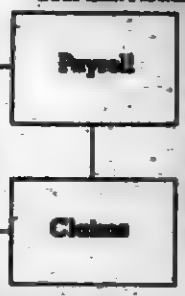
able. InSci started the HPS industry back in 1965, and we've led the field ever since. Our technical experts have provided you features unmatched by any other company.

Modularized Design For Easy Maintenance. InSci "Whole Person" software was designed from the top down and is highly modularized, providing maximum flexibility. A single module or subroutine supports each specific function in the system.



User Exit Routines. Strategic areas built into the InSci system allow exits to override the standard system routines. This means you can add your own programs without changing database system codes. InSci also gives you source codes so you can go into the system directly if you desire and still receive maintenance.

Preliminary or final processing mode. InSci systems let you select the most efficient operating mode for each processing task. All changes can be processed in real-time, so they become effective immediately. Preliminary processing allows for simulating situations such as a payroll run without affecting the database. And, of course, InSci systems provide state-of-the-art security precautions, complete maintenance support and training.

portedly be selected by the customer, and protection is said to be provided against input surges of up to 20A.

The DPX-51 weighs 14 lb and is priced at $40 for production-quantity orders.

Datapower, 3235 W. First St., Santa Ana, Calif. 92703.

HEWLETT-PACKARD CO.
HP 6032A; HP 6023A

Hewlett-Packard Co. has introduced two autoranging power supplies, the HP 6023A, reportedly supplying 200W in constant voltage/constant current form, and the HP 6032A, which supplies 1 kW.

The HP 6032A, according to the vendor, provides its power over a range of voltage and current, from 6.7V at 30A to 20V at 10A. The HP 6032A reportedly produces up to 50A at output voltages up to 20V. It develops no fewer than 1 kW through its 20V to 60V output range.

The HP 6032A is said to sense a low- or high-ac line or an over-temperature condition and then disable itself until the condition is remedied.

The HP 6032A is priced at $3,100. The HP 6023A is priced at $1,550.

Hewlett-Packard, 1820 Embarcadero Road, Palo Alto, Calif. 94303.

DISPLEX, INC.
Ac line conditioner

Displex, Inc. has introduced an ac line conditioner.

According to the vendor, the conditioner furnishes sine wave outputs by providing electronic voltage regulation as well as eliminating electrical line noise, surges and spikes.

The list price is $775 for a 1-kVA unit, $875 for a 2-kVA model and $1,295 for a 3-kVA conditioner.

Displex, Alexander Place, Glen Cove, N.Y. 11542.

CONTROLLED POWER CO.
7000 series

Controlled Power Co. has announced the 7000 series of power distribution systems, said to feature power line monitoring, power conditioning and purification.

Covering a power requirement range from 10 kVA to 225 kVA, the series reportedly offers both basic and extensive power line conditioning and system operation monitoring options. Prices begin at $3,700.

Controlled Power, 1955 Stephenson Highway, Troy, Mich. 48083.

CONTROL CONCEPTS CORP.
Isiatrac

Control Concepts Corp. has announced Isiatrac, a surge suppressor designed for small computer systems.

Isiatrac constantly tracks input power, monitors transient voltages, detects disturbances, absorbs them and supplies additional power, according to a spokesman.

The surge suppressor guards against memory loss, data disturbance, improper program execution, system crashes and deterioration of system components.

Isiatrac ranges in price from $79 to $350, depending on a computer's size and configuration.

Control Concepts, 295 Water St., P.O. Box 1500, Binghamton, N.Y. 13902.

BOARD-LEVEL DEVICES

ORIGIN, INC.
OR-86RLQ

Origin, Inc. has announced a 600K-byte disk cache memory feature, the OR-86RLQ, for Digital Equipment Corp. Model RL01 and RL02 disk drives.

The disk cache board is said to double the speed of DEC Q-bus systems and cache data accessed by programs automatically. It is compatible with Unix and DEC's RSTS/E, RT11 and RSX operating systems.

The OR-86RLQ costs $3,300 in single-unit quantities and will be available in the second quarter.

Origin, 9136 Gibson St., Los Angeles, Calif. 90034.

AUXILIARY EQUIPMENT

RELIANCE ELECTRIC CO.

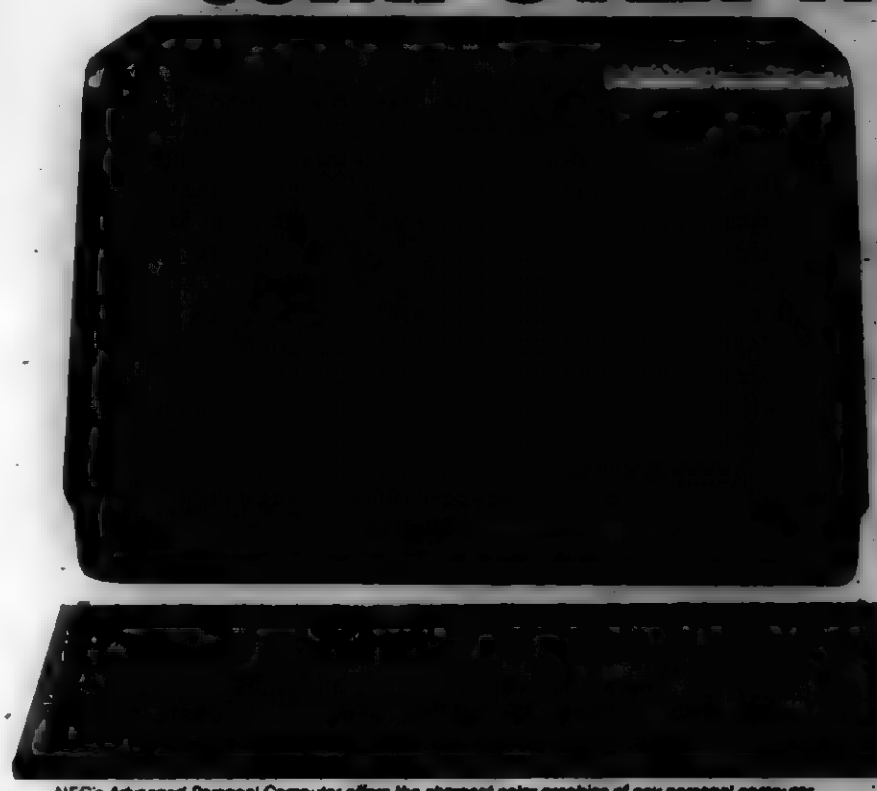
Reliance Electric Co. re-

HAVE YOU BEEN BLIND COMPUTER WITH THE



NEC's Advanced Personal Computer offers the sharpest color graphics of any personal computer.

NEC's Advanced Personal Computer offers the widest range of quality graphics.

One reason the APC is better is that it lets you do more kinds of graphics than any other personal computer.

In fact, it gives you the kind of graphics you'd expect only from a much more expensive computer.

With the APC, you can produce color transparencies, color slides, or output to a variety of printers and plotters.

You can even do Computer Aided Design (CAD).

Our screen is graphically better.

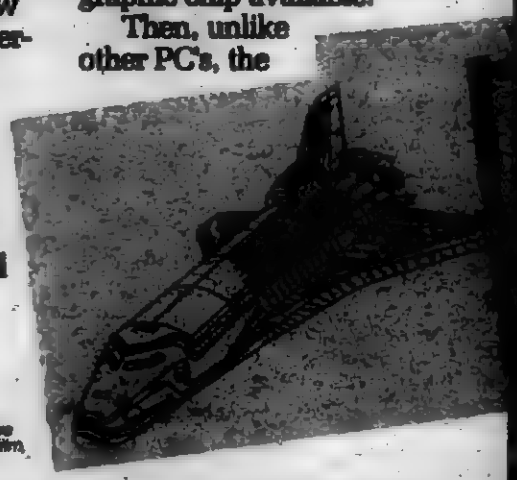
Seeing is believing. And one look at our color screen will prove it's the best.

But it's no accident. It starts with the NEC 7220 graphics processor, the most advanced graphic chip available.

Then, unlike other PC's, the

Graphics are being used more and more by businesses every day. They give companies a clearer picture of their place in the market. They make for more effective presentations. And with slides and color transparencies, they can let a room full of people see the same thing at once. Although most people see the value of graphics, very few are aware of the personal computer that lets them create the best color graphics.

It's the Advanced Personal Computer from NEC.



This slide was produced from the screen using Videograph™ software, an inexpensive Screen Shooter™, and Polachrome™ 35mm film, in less than 5 minutes. For less than $1.00!

SYSTEMS & PERIPHERALS

cently announced the Model 45C100 Portable Intelligent CRT programmer designed to develop and maintain application programs for the company's Automate programmable controllers.

Sized to be carried as hand luggage on most airlines, the Model 45C100 was designed to be used with different Automate programmable controllers by downloading an executive program from a micro floppy disk to its main memory, a spokesman for Reliance said.

Programs may be written off-line or on-line and loaded into a programmable controller, as well as downloaded onto blank micro floppy disks to provide a convenient method of building and storing a program library, the spokesman said. The CRT interfaces to any Automate via one or two serial channels or Reliance's R-Net local-area network.

The product is priced at $5,100 and features a 9-in. diagonal screen.

Reliance Electric, 2500 Tungsten Road, Cleveland, Ohio 44117.

SPHERE TECHNOLOGY, INC. VS1000

Sphere Technology, Inc. has announced a voice entry product that operates in a workstation environment with the IBM 3274 controller and IBM 3278 or compatible display terminals.

The VS1000 is said to provide voice data entry, local user screen formatting and help center facilities. The product's voice entry is said to reduce keyboard data entry activity by enabling users to enter and access data simultaneously while performing their other job tasks.

With the VS1000, productivity improvements of 15% to 40% are possible, the vendor said. These improvements are said to be possible without IBM host programming changes.

The product communicates with 3274 and 3276 controllers and allows 3276, 3270 and 3178 CRT terminals, as well as IBM's Personal Computer or Digital Equipment Corp. VT100 CRT terminals to be used.

The VS1000 will be available for delivery, primarily to OEMs, in July, the vendor said. The single-unit price will be $7,500 with quantity discounts available.

Sphere Technology, 152 Richmond St., Providence, R.I. 02903.

WANG from page 76

tems can be configured with local and remote workstations to support a combination of DP and office automation applications. Backup devices may be added depending on individual user requirements, Wang said.

The systems cost from $70,000 for the VS85-70F and from $77,000 for the VS85-147F. They will be available in June, Wang said from One Industrial Ave., Lowell, Mass. 01851.

SUPER from page 76

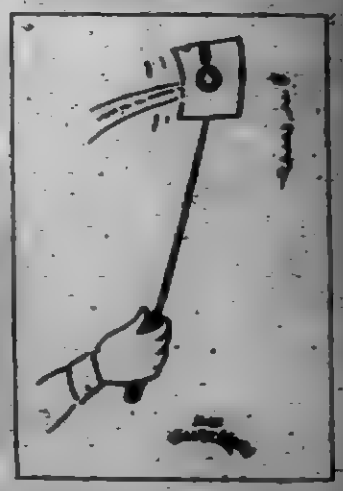
be added without taking the entire system off-line, the vendor said.

An Eternity system can handle three compatible types of storage module drive disk subsystems offering capacities from 56M to 474M bytes.

Drives can operate at an average access time of 30 msec and can achieve data transfer rates of 1.2M to 1.8M byte/sec, the vendor said.

The Eternity version of Unix is compatible with the Western Electric Corp. System V and the University of California at Berkeley Versions 4.1 and 4.2.

Designed primarily for systems integrators and value-added remarketers, an entry-level configuration costs $75,000. The vendor is located at 51 E. Daggett Drive, San Jose, Calif. 95134.



TO THE PERSONAL BEST COLOR GRAPHICS?

Contest MBA™ runs in high resolution color on the APC. But it can only run in one color on the color monitor of the leading brand.

APC graphics option has its own dedicated memory, so there's never a tradeoff between color and resolution.

Software will make you a big-time producer.

Better hardware alone isn't enough. You also need better software. And NEC provides that, too.

Take Graphplan™ for example. Graphplan can take spreadsheet format data and produce customized business graphics on paper. Instantly.

Graphwriter™ will let you produce professional color graphics in over 20 different formats. Then turn them into transparencies or hard copies using the most popular pen plotters.

Videograph™ makes creating free-form color images for slide presentations easy and inexpensive.

Autocad™ lets architects, engineers and designers create sophisticated graphics and designs, then produce precise drawings with popular plotters.

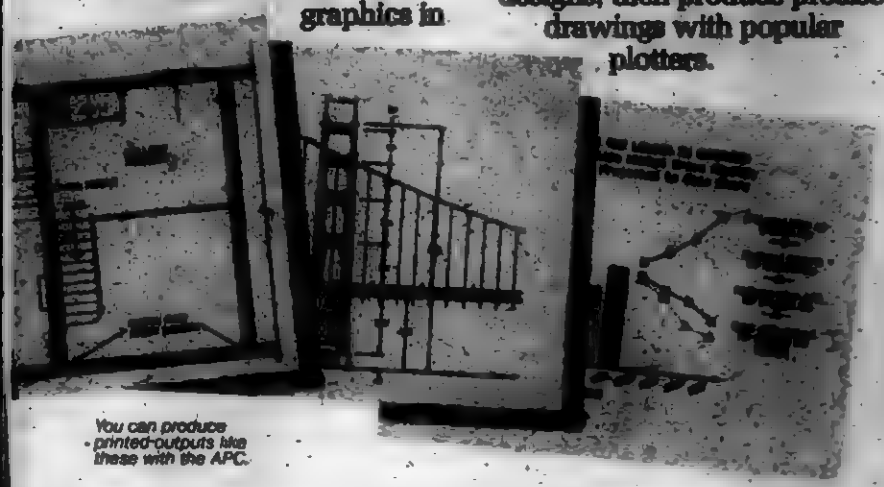
Designers can use Autocad™ to make the design process faster and easier.

This software combined with the APC hardware will give you the best graphics you can get on any personal computer.

For the complete picture, call NEC.

For product literature on any of NEC's APC graphics capabilities, call 1-800-343-4419. In Massachusetts, call 1-617-264-8635.

And find out why more and more graphics users with vision are saying "NEC and me."



You can produce printed-outputs like these with the APC.

Ferocious FORTRAN.

Microsoft® FORTRAN crunches numbers with a vengeance!

It combines fast and efficient native code compilation with built-in 8087 coprocessor support. The result? Mini and mainframe performance from your MS™ DOS micro.

Based on the '77 standard, Microsoft FORTRAN supports extensive statements and data types—including complex numbers and IEEE single and double-precision floating point accuracy.

Support for large arrays (greater than 64K bytes), separate module compilation, and overlays, allow you to create very large programs—up to one megabyte, with access to more than 65 thousand records in a file as large as four gigabytes.

MICROSOFT. The High Performance Software

How do programmers feel about Microsoft FORTRAN?

"The first FORTRAN compiler that takes advantage of the full addressing capability of the 8088 and the power of the 8087."

—Jack Wilschke, *Softalk*

"We decided to use the Microsoft FORTRAN Compiler for its INTEGER 4 capability and the flexibility of its 8087 implementation."

—Charlie Huizena & Chip Barnaky, *PC World*

Call 800-426-9400 to order the ferocious FORTRAN. $350*

In Washington State, call 206-828-8088. Ask for operator F3, who will rush you your order, send you more information, or give you the name of your nearest dealer to see Microsoft FORTRAN in action.

MICROCOMPUTERS

MICRO BITS
Paul Gillin
CW Senior Editor

Help on the way for programmers

Considering that just three years ago they were kings of the computing hill, programmers who are interested in micro software must now be feeling like the last kid chosen for the sandlot baseball team. Vendors are falling all over each other in a Keystone Cops-like effort to court the end user, but there have been few good outlets for technical people to obtain the information they need.

Now a Dedham, Mass.-based firm is trying to capitalize on that perceived neglect. The Programmer's Shop, created last April, sells micro software almost exclusively to professional programmers. For example, in an average month the company ships about 150 C compilers as compared with seven Micropro International Corp. Wordstars and two Ashton-Tate Dbases, according to founder Bruce Lynch.

In fact, the company's promotional literature claims that sales people will politely turn away inquiries about the relative merits of certain spreadsheet software, but will cheerfully respond to an inquiry about the virtues of the same software as a programming tool.

To augment its sales business, the Programmer's Shop offers a newsletter, a software finder's service, product evaluations and comparisons, a computerized bulletin board and consultant and programmer referrals, Lynch said. Most of the services are provided at little or no charge.

The strategy has apparently been successful. From a volume of 15 shipments

Reconciling MIS, micros

A case for the 'Personal Info Center'

By Richard Nanteau
Special to CW

Early this year I got a call from a friend who is a division chief financial officer of a Fortune 500-size company. "I just came from a planning meeting where two of our managers made presentations," he said. "Both used spreadsheet programs on their personal computers to produce the numbers, and each of them came up with a completely different prediction."

My friend continued, "The problem occurred when the analysts entered the actual results into their models by copying data from printouts — one used a week-old report, the other used a revised report he got that day. To make it worse, there were at least two data entry errors in the copying. Maybe the only real solution to problems like this is to take away all the personal computers and software used in our organization."

"No, I don't agree," I told him. "Your story isn't an argument against using personal computers; it's proof that they haven't been used enough."

This situation is typical in many companies. The most common problem new personal computer users have encountered is that while they may be using the same spreadsheets, they are not necessarily working with the same data.

We recently surveyed MIS directors at 80 of the largest corporate computer users in the U.S. Seventy percent of the companies we talked to said they were involved with information centers and that they felt these efforts were important and well-accepted in their organizations.

But when we talked to the same companies about personal computers, we came up with a different picture. Very few formal plans had been laid out. More importantly, we believe the MIS managers dramatically underestimated the number of personal computers in use in their companies. If we totaled up answers from 30 of the largest companies in the U.S., we came up with about 6,000 personal computers. Estimates vary, but the consensus is that there are at least 500,000 personal computers installed in the top 1,000 companies.

We have discovered that the information center user tends to be very computer-literate. Personal computer users, on the other hand, tend to be managers, analysts or other professionals whose personal computers are adjuncts to their jobs.

Through the information center, MIS has been able to deliver information to more people than ever before. However, most of the personal computer group members in our study were "Visicalcing" away, without MIS sponsorship. The end users

Leading Edge recalls micros

NEEDHAM, Mass. — Leading Edge Products, Inc. has recalled the first 1,170 units of its personal computer that were sent to dealers prior to Feb. 3.

According to a company spokesman, the power supplies in the CPU may be defective and continued use may be dangerous.

The CPU unit of Leading Edge Products' personal computer, manufactured by Mitsubishi Electric Co. and bearing an Underwriters Laboratories, Inc. approval, has not caused any problems yet, the company said.

Dealers and end users are asked to stop use of the system immediately. Each power supply will be replaced by Leading Edge soon, a spokesman said from 225 Turnpike St., Canton, Mass. 02021.

Sanyo's MBC 5500 tops Auerbach's spreadsheet survey

By Paul Gillin
CW Staff

PENNSAUKEN, N.J. — If you plan to make spreadsheet your principal microcomputer application, you might check out the Sanyo Business Systems Corp. MBC 5500 computer. Auerbach Publishers, Inc. has named it the No. 1 micro system configuration for spreadsheets.

Auerbach's Microcomputer Ratings on spreadsheet applications assigned the Sanyo MBC 5500 a quality rating of 12.54 points, based on capabilities and price. In contrast, the IBM Personal Computer finished in 30th place with a quality rating of 7.40. In all, the Sanyo micro captured three of the top 10 spots for spreadsheet applications [see related chart].

The survey evaluated 119 microcomputers and rated them in order of the best spreadsheet capability per dollar spent. While the Sanyo MBC 550 does not offer the most elegant features, its price of $1,793 for a configuration including 128K bytes of memory, Microsoft, Inc.'s MS-DOS operating system, a CRT monitor, 14 char./sec printer and three bundled software packages makes it a best buy, the report stated.

The Auerbach ratings were based on a recommended spreadsheet configuration that includes 64K bytes of memory, a single diskette drive, 80-col. upper/lowercase display with at least 20 lines of text displayed and a dot matrix printer. Generic components were added when not supplied by the vendor to satisfy the recommended configuration requirements, the survey stated.

The relative capabilities of each component in the system were measured using standard quality point ratings, and prices for the required components were included in the rating formula.

Based on those criteria, the five lowest rated systems included Charles River Data Systems, Inc.'s Universe 68/47, Burroughs Corp.'s B20 Series Model 22, Perq Computer's Perq, Cado Systems Corp.'s Tiger/ATS 64 and Digicomp Research Corp.'s Delphi-100. However, price was the major mitigating factor in systems of the lowest rated group, most of which were designed for more complex applications.

Extra quality points were awarded for systems handling larger word sizes, larger disk and memory capacities, CRT monitor resolution, printer capabilities, communications and I/O ports, capability to support multiple operating systems, inclusion of bundled software and price. Fifty percent of the systems evaluated were single station/single task, while 39.4% were multiple station/multiple task. Forty-four percent were 8-bit machines.

Auerbach's microcomputer ratings are available for $14.95 each or three for $35 from 6560 N. Park Drive, Pennsauken, N.J. 08109.

466 ways to use an HP 3000.

The point of buying a computer is to speed things up. So why let programming slow you down?

With the HP 3000 family of business systems, you can usually be up and running as soon as you plug them in. Because our computers come with a vast range of ready-to-use software that covers the applications spectrum from accounts payable to zoning.

We wrote many of these special programs ourselves. Last year alone, we supplied customers with more than $50 million worth of applications software. Others come from a variety of software firms working closely with us.

So the chances are pretty good that your own programming effort can be trimmed substantially. When you do need to write your own programs, the HP 3000 will help you do it much faster. With our special set of programming tools, customers have cut 500 lines of code down to 100. At about $50 a line, that really adds up.

Here's another way you save. With complete compatibility across the entire range of HP 3000s, you don't have to spend a dime converting software from one system to run on another. That's a big help when you're picking the right computer for a branch office or a regional center. Or any size office in-between.

Press here.

When you write a program for our inexpensive Series 39, you can also use it on our Series 68 distributed mainframe which handles up to 400 users. Or on our mid-range Series 42 and 48 computers.

Here's some more help in making your selection. The HP 3000 costs up to 40% less than comparable systems. So you save on the hardware as well as the software.

If you'd like to see how useful an HP 3000 can be, call your nearest HP sales office listed in the white pages. Ask a Business Computer Specialist for a demonstration. Or write for more information to Tom Rappath, Hewlett-Packard, Dept. 03184, 19447 Pruneridge Avenue, Cupertino, CA 95014. In Europe, write to Henk van Lammeren, Hewlett-Packard Nederland B.V., Dept. 03184, P.O. Box 529, 1180 AM, Amstelveen, The Netherlands.

HEWLETT PACKARD

IBM micro group considering going national

By Jeffry Beeler
CW West Coast Bureau

LOS ANGELES — A users group that caters to owners of IBM micros is strongly considering the idea of making the transition from a regional to a nationwide organization. To date, the IBM Users Group, Inc. has strictly confined its base of operations to Southern California.

"We've received a number of inquiries from people in other parts of the country," according to the group's president, Neil Zachary. "We're not really pushing [the idea], but we're not opposing it either."

During its infancy, the users group consisted of only one chapter, which was located here and served the whole Greater Los Angeles area.

Then, within the last few months, the organization formed two additional chapters — one each in the neighboring communities of Pasadena and Laguna. The members organized their own chapter and now meet locally.

In Laguna, meanwhile, a second group of users also expressed an interest in forming their own chapter. "But they didn't want to be bothered with a lot of organizational work," Zachary said, and thus approached the existing Los Angeles chapter with an appeal for help in getting started.

Now the users group may be poised for yet another expansion that would include the entire continental U.S.

Many of the group's member services, including the production of its monthly newsletter and the selection of featured speakers for local chapter meetings, are furnished centrally by the original Los Angeles organization.

Benefits whole group

The recent formation of the Pasadena and Laguna chapters has benefited the users group as a whole, Zachary said.

It provides additional sources of information for the monthly newsletter, enlarges the organization's existing library of software in the public domain, strengthens the group's ability to attract name speakers and creates additional opportunities for the exchange of useful information.

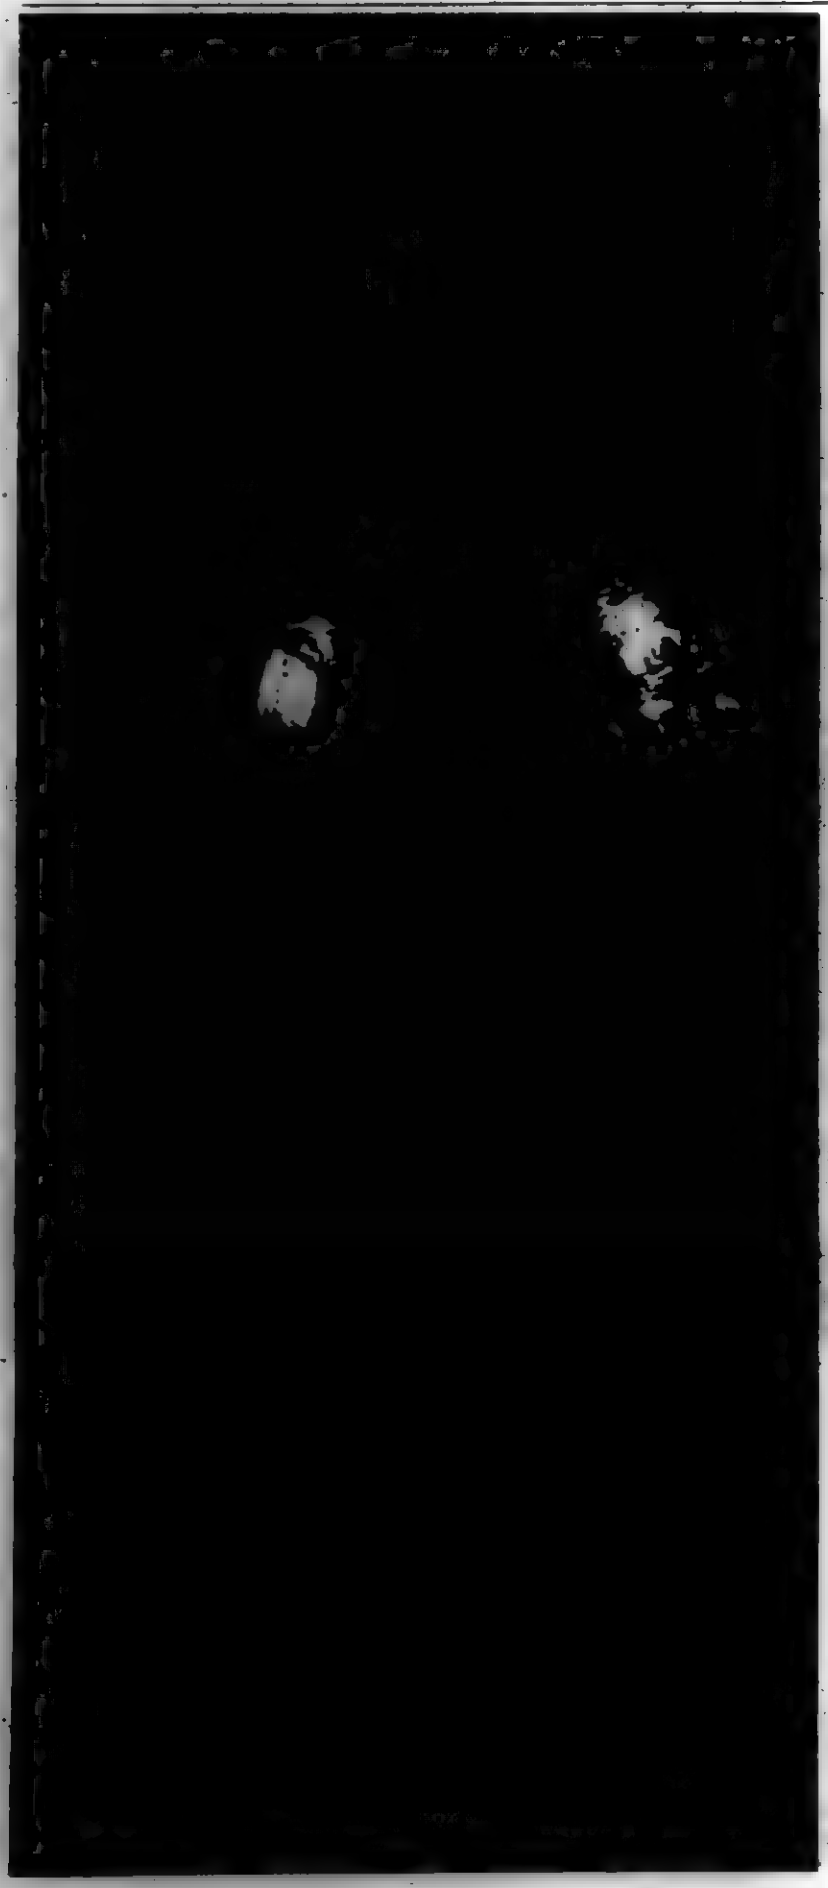
Moreover, the addition of two extra chapters greatly increases the chances for face-to-face interactions among group members. "Space permitting, a member of one chapter is free to attend the meetings of any other chapter," Zachary said.

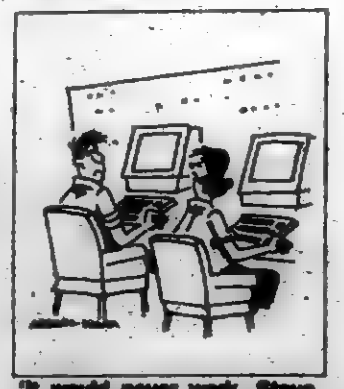
Each of the group's three constituent local organizations has its own characteristic outlook, composition and personality.

The original Los Angeles chapter, for example, boasts the widest diversity of members, with a smattering of technical people and professionals as well as a large contingent of business-oriented employees from large corporations, Zachary said.

The Pasadena chapter, by contrast, is composed primarily of technical users, while the Laguna organization is dominated by computing novices, he added.

More information about the IBM Users Group can be obtained from Zachary at P.O. Box 4136, Los Angeles, Calif. 90078.





'It would never work, Steve. I'm Fortran and you're Cobol.'

MICROCOMPUTERS

Vector Graphic announces business microcomputer

THOUSAND OAKS, Calif. — Vector Graphic, Inc. has announced a business microcomputer with memory expansion of up to 896K bytes and support for three operating systems. The Vector SX is almost twice as fast as previous Vector systems, a spokesman said.

The Vector SX employs an 8-bit Zilog, Inc. Z80 processor in addition to a 16-bit Intel Corp. 8086.

The standard operating system is Digital Research, Inc.'s CP/M 86, with a simulator that allows Digital Research CP/M applications to be run as well.

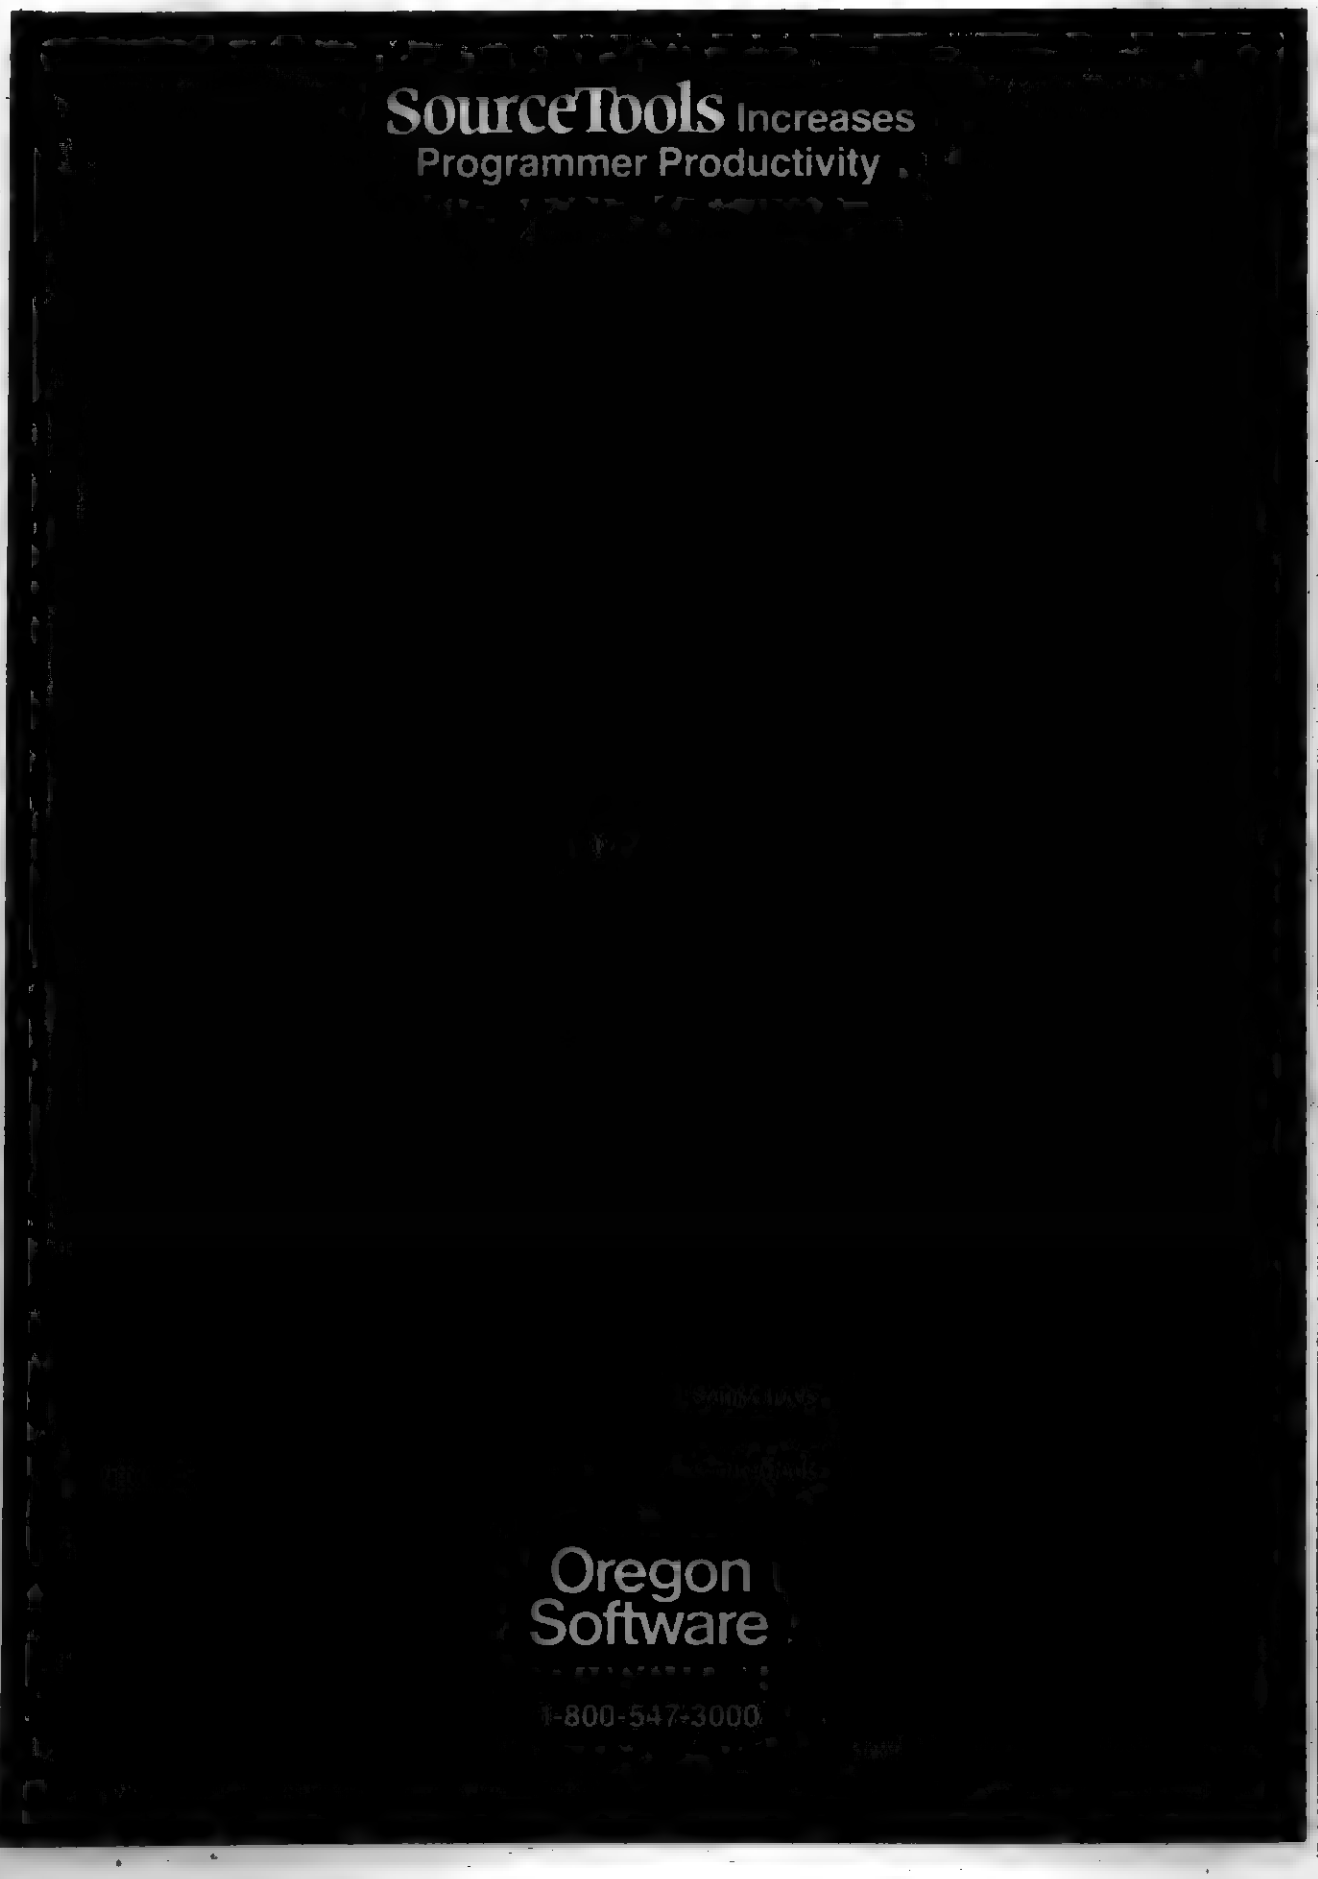
Microsoft, Inc.'s MS-DOS 2.1 operating system is optional and can co-reside with CP/M 86 on a hard disk. Digital Research's Concurrent CP/M 86 will be available in May, the spokesman said.

IBM-compatible, soft-sectored floppy disk drives and related software allow the Vector SX to read disks from a variety of manufacturers, the spokesman said.

The system also incorporates an intelligent detached keyboard, high resolution, monochrome graphics display, 32K bytes of video random-access memory (RAM), three expansion slots, a tone generator, one serial printer port, two parallel printer ports and an RS-232 communications port, according to the spokesman.

A Vector SX with a 737K-byte floppy drive and 10M-byte hard disk is priced at $6,294, including monitor. Other 128K-byte RAM systems range from $4,295 to $9,995.

Vector Graphic is located at 500 N. Ventura Park Road, Thousand Oaks, Calif. 91320.



Wang offers OIS 60 processor

LOWELL, Mass. — Wang Laboratories, Inc. has introduced the OIS 60, a clustered information processor for small and medium-size businesses.

The processor has 33.5M bytes of fixed disk memory supporting up to eight users and five peripheral devices. Standard software includes the company's word processing with advanced functions, decision processing, a sort utility for performing an alphanumeric sort on records, math support and system security. A message control function is also standard, a company spokesman said.

Information processing on the OIS 60 can be optimized through the use of Wang Systems Networking (WSN). Included in WSN is Wang Office, which provides several information management functions within a network including electronic mail, time management, user directories and file management capabilities.

The OIS 60 master, which includes word processing, utilities and advanced functions system software, costs $9,000, Wang Laboratories said from One Industrial Ave., Lowell, Mass. 01851.

SYSTEMS

PERTEC COMPUTER CORP.
4210

Pertec Computer Corp. has introduced a low-end model, the 4210, to its Pick operating system-based Sabre family of computers.

The 4210 includes 256K bytes of memory, a 10M-byte Winchester hard disk, four serial ports and an 800K-byte floppy disk. It can reportedly be field-upgraded to the vendor's 4220 model, which includes 1M byte of memory and 80M bytes of Winchester disk storage.

The 4210 retails for $9,400.

Pertec, 17112 Armstrong Ave., Irvine, Calif. 92713.

MICROCOMPUTERS

DBS INTERNATIONAL, INC.
DBS 16 enhancements

DBS International, Inc. has enhanced its DBS 16 multiuser, supermicrocomputer system so that it supports 28 users.

The system features Intel Corp. 80186 microprocessors; 256K bytes of random-access memory (RAM), expandable to 3.58M bytes of RAM; and storage capacity from 720K bytes to 40M bytes, the vendor said. An optional 20M-byte cartridge tape drive is available, according to the vendor.

The system uses Digital Research Inc.'s MP/M 86 operating system; Digital Research's Concurrent CP/M is an available option. DBS International's DBS-Net links the microcomputers. Prices range from $4,190 to $39,000.

DBS International, Welsh Road and Park Drive, P.O. Box 425, Montgomeryville, Pa. 18936.

AES Data Corp.
AES Savin 7100; AES Savin 7200

The AES Data Corp. has introduced an office workstation, which can reportedly act as a stand-alone word processor, and a word processor with the personal computer capability to support multiple work stations.

The workstation, the AES Savin 7100, can reportedly be used for both word and data processing and supports Digital Research, Inc.'s CP/M 2.2 operating system. Its basic configuration includes 128K bytes of memory, a letter-quality printer, detached keyboard, 12-in.-screen terminal, two disk drives and software for $6,495.

The AES Savin 7200, is a multifunction, shared-logic word processor that uses modular software elements. A four-screen configuration, including one CPU, using both 12- and 16-bit processors, a 10M-byte rigid disk drive and one 45 char./sec letter-quality printer, costs just under $30,000.

The Savin 7200 supports Digital Research's CP/M 86 operating system in addition to the AES proprietary operating system.

AES Data, P. O. Box 10272, 9 W. Broad St., Stamford, Conn. 06904.

DOUBLE GOLD SOFTWARE, INC.
Lock-it-up

Double Gold Software, Inc. has introduced its Lock-it-up copy protection systems for the IBM Personal Computer and compatibles.

According to the vendor, the Lock-it-up system is a menu-driven diskette copy protection and duplication utility featuring several levels of protection for standard diskettes.

The IBM version of the product protects versions that run under IBM's PC-DOS. The protection takes 6K bytes of memory and will work with up to three dual-sided drives.

System requirements include 128K bytes of memory, two or more 40-track disk drives and IBM's PC-DOS operating system. The IBM version of the product costs $495.

Double Gold Software, Suite 29, 3900 Moorpark Ave., San Jose, Calif. 95117.

COLBY COMPUTER
Colby PC-3

Colby Computer has announced Colby PC-3, a transportable microcomputer that is compatible with the IBM Personal Computer.

Colby PC-3 weighs 26 lb, uses an Intel Corp. 8088 microprocessor and has a 9-in. amber screen and two double-sided, double-density disk drives. The unit features 128K bytes of random-access memory, expandable to 1M byte, a real-time clock, serial port and parallel port. It costs $2,795.

Colby Computer, 849 Independence Ave., Mountain View, Calif. 94043.

STORAGE

ACKNOWLEDGE, INC.
AT-1600-PC

Acknowledge, Inc. has introduced a tape backup system designed specifically for the Wang Laboratories, Inc. Professional Computer.

According to the vendor, the AT-1600-PC, a 17.5M-byte system, is file-oriented, allowing users to back up and recover selectively any data they need in the order they want. The 4-track, 6.4K bit/in. serial cartridge drive can handle 17.5M bytes of data per 555 feet of tape.

The unit reportedly is driven by an intelligent interface card that takes up a single slot in the Wang Personal Computer.

The system costs $2,995, which includes controller, cables, tape drive, cabinet, power supply, software, documentation, installation and a one-year warranty.

Acknowledge, 55 Union Ave., Sudbury, Mass. 01776.

ZETRATEC CORP.
Zeke

Zetratec Corp. has unveiled an intelligent subsystem that can be used as a backup for Winchester drives or as a stand-alone unit for small business and personal computers.

Zeke reportedly offers the user full random data accessibility with up to 28M bytes of high-density storage on one cartridge tape. It is compatible with the IBM Personal Computer and Personal Computer/XT. Zeke is plug-compatible with industry-standard interfacing and functions with most regular or mini floppy disk controllers, the vendor said.

The product is priced at $1,995.

Zetratec, 1685 Olympic Blvd., Santa Monica, Calif. 90404.

Finally a CICS query system that's as easy for the DP department as it is for the end user.

Introducing ExecuTrieve.

From the perspective of the DP professional, ExecuTrieve represents a dramatic breakthrough in query system efficiency.

No disruption. ExecuTrieve operates with your existing files in your CICS environment. It doesn't require costly system changes or any additional programming.

Low overhead. Through the use of our proprietary access method, users can browse or create complex reports with remarkably low I/O and CPU overhead.

Easy to install. ExecuTrieve can be installed and operational in as little as one afternoon.

Of course, efficiency is only half the story. ExecuTrieve makes as much sense for the end user as it does for you. Look at it from the other side.

Introducing ExecuTrieve.

From the perspective of the end user. ExecuTrieve is a remarkably simple, but powerful query system.

Easy to learn. ExecuTrieve is a free-format fully on-line system using simple English syntax and requiring no computer sophistication. An editor even allows you to correct errors anywhere in the text.

Quick response. Our proprietary access method means quicker response to even the most complex queries. In fact, the more complex the query, the quicker the response.

Complete reports. ExecuTrieve has a report generator and graphic capability. So it's a snap for non-pros to develop effective reports.

Efficient for the professional. Easy for the end user. Any way you look at it, ExecuTrieve is a query system worthy of investigation.

Call or write On-Line Software International.

PERTEC COMPUTER CORP.
Magnetic tape option

Pertec Computer Corp. has introduced a ¼-in. magnetic tape drive for use with its Pick & Associates, Inc. Pick operating system-based Sabre Model 4240 multiuser system.

The drive comes with an intelligent controller, reportedly allowing virtually any ¼-in. tape using the Pertec interface to be run.

The tape drive is priced at $6,000.

Pertec, 17112 Armstrong Ave., Irvine, Calif. 92713.

PRINTERS/ PLOTTERS/ PERIPHERALS

IMAGE RESOURCE CORP.
Samurai CFR Model 9

Image Resource Corp. has introduced the Samurai CFR Model 9, a business presentation color graphics system that produces color slides from an IBM Personal Computer, Personal Computer XT, Personal Computer XT/370 or 3270 Personal Computer.

The Samurai is a stand-alone film recorder and graphics processor circuit board that plugs into one of the Personal Computer expansion slots.

According to the vendor, Samurai uses a proprietary continuous writing technology instead of the discrete pixel format of most graphics screens. As a result, there are no ragged edges on graphics elements, the company claimed.

Dual 5¼-in., flexible disk drives and 192K bytes of memory are required.

The Samurai is priced at under $10,000 for the hardware interface, graphics utility software and desktop film recorder.

Image Resource, 733 Lakefield Road, Westlake Village, Calif. 91361.

ENVISION TECHNOLOGY, INC.
Vectorprinter

Envision Technology, Inc. has introduced Vectorprinter, a color text and graphics printer, enhanced to emulate printers and pen plotters compatible with the IBM Personal Computer and Personal Computer XT.

Vectorprinter's capabilities allow business and technical professionals to do word processing and graphics at one workstation, a spokesman said.

Envision has enhanced Vectorprinter to emulate the Diablo Systems, Inc. 630 family of printers, enabling it to run a variety of word processing systems.

The price of Vectorprinter is $3,495 in single-unit quantities, with volume discounts available.

Envision, 631 River Oaks Pkwy., San Jose, Calif. 95134.

BOARD-LEVEL DEVICES

MICROPHONICS TECHNOLOGY CORP.
Oto-1

Microphonics Technology Corp. has introduced Oto-1, a speech recognition system that can convert Microsoft, Inc. MS-DOS software packages to speech input for both menu commands and data entry.

The system consists of a single circuit board that plugs into any auxiliary slot in an IBM Personal Computer, Personal Computer XT or IBM-compatible computer. According to the vendor, a proprietary firmware and software combination provides a transparent interface with the applications program, allowing voice input to be used interactively with a keyboard or another data entry device.

The system includes 16K bytes of random-access memory, expandable to 64K bytes; a 128-word, on-board vocabulary; and better than 98% word recognition accuracy, the company said.

Oto-1 is priced at $795.

Microphonics Technology, P.O. Box 7411, Federal Way, Wash. 98003.

PARADISE SYSTEMS, INC.
Paradise multidisplay card

Paradise Systems, Inc. has introduced the Paradise multidisplay card for the IBM Personal Computer, Personal Computer XT and compatibles.

According to the vendor, the display card provides the user with a color display controller, monochrome display controller and printer interface, all on a single board.

The card is compatible with all IBM Personal Computer software and has the capability to support Lotus Development Corp.'s Lotus 1-2-3 using two displays.

The multidisplay card sells for $595.

Paradise Systems, 150 M. Hill Drive, Brisbane, Calif. 94005.

AUXILIARY EQUIPMENT

PARA SYSTEMS
Minuteman

Para Systems has introduced an uninterruptible power supply model that provides standby emergency power and voltage regulation for most microcomputers, disk drives and word processors.

The Minuteman is rated at 250W, the vendor said, but will safely handle some microcomputers with higher rated power, including the IBM Personal Computer XT.

When power interruptions occur, the Minuteman switches from ac power to its own emergency battery power for up to 15 minutes.

The Minuteman is priced at $485.

Para Systems, Suite 404, 11425 Mathis St., Dallas, Texas 75234.

CEAG ELECTRIC CORP.
Model COM3000

Ceag Electric Corp. has introduced the Model COM3000 triple-output power supply designed for microcomputers.

The 80W switching regulator uses a high-reliability flyback converter topology with filtered outputs and transistor-to-transistor logic. According to the vendor, each unit has overvoltage protection, is open-circuit- and short-circuit-proof and meets Federal Communications Commission requirements.

The price is $114 for each COM3000 in quantities of 100.

Ceag Electric, 1324 Motor Pkwy., Hauppauge, N.Y. 11788.

Here are a few good reasons why you should make Local Data your protocol converter company.

Local Data's comprehensive line of local and remote protocol converters have been used around the world to make async-to-IBM communications simple and economical.

DATALYNX™/3274.
DataLynx™/3274 remote async ASCII protocol converter supports SNA/SDLC or BSC protocols. 80 types of ASCII async terminals can emulate IBM 3278 display stations. RS-232C ASCII async printers can emulate IBM 328X printers.

DATALYNX™/3780.
DataLynx™/3780 async ASCII-to-IBM 3780, 2780, 2770 and 3741 protocol converter supports EBCDIC BSC protocol on one channel and async ASCII devices on the other two channels. Features include transparency, mini/micro support and free file transfer program.

INTERLYNX™/3278.
InterLynx™/3278 allows the attachment of low-cost ASCII CRT terminals or p.c.'s to 3274/3276/4701 and 45XX integrated adaptor Type "A" coax ports. InterLynx/3278 enables the user to use async CRT's on IBM systems and switch to async applications under terminal control.

FILELYNX™/3278.
For micro-mainframe file transfers.

INTERLYNX™/3287.
InterLynx™/3287 allows attachment of ASCII printers to IBM Type "A" coax ports or 3274/3276/4701 controller and 4321/4331 CPU's.

SNA LU1 SCS and LU3 capability are standard with the InterLynx/3287. Features include parallel and serial ports and front panel set-up.

In the world of business software, there's only one number one. 1-2-3" from Lotus.

And it's been that way almost from day one. Since January of 1983, 1-2-3 has consistently been at the top of the software best sellers lists.*

And it's the best selling PC software in the world, for one very good reason. It's the very best PC software.

The PC software that simply does more for you.

1-2-3 gives you the most powerful productivity software available today. An analytical tool that combines spreadsheet, graphics and information management into one incredibly fast, easy-to-use package.

With 1-2-3, you can analyze, interpret and report information in seconds with just the touch of a key.

And because it's all one program, you not only work faster and smoother, you work smarter.

But don't just take our word for it.

Take the word of the experts. *The New York Times* heralded 1-2-3 as "the wave of the future in business software." And recently they wrote, "In scarcely a year, the Lotus Development Corporation has done for the world of personal computer software what International Business Machines has done for personal computers: it has created a product so wildly successful that scores of other companies are scrambling to imitate or improve on it."

Software News said, "1-2-3 has more capabilities than any other program in its class."

"It is the one product that without doubt has single-handedly changed the face and direction of the personal-computer-software industry," was the way *Info-World* put it.

Softalk simply wrote, "Lotus's 1-2-3 is so dominant, it doesn't seem as though there's room for other software." And in 1983, 1-2-3 from Lotus was good enough to be named a "Product of the Year" by both *Fortune* and *Info-World*.

It's the difference between getting by and getting ahead.

What can 1-2-3 do for you? What it's already done for hundreds of thousands of PC users. Give you a proven business software that can dramatically increase productivity for you and everyone in your company.

After all, when it comes to looking out for number one, going with number one is the only way to go.

To find out what 1-2-3 from Lotus can do for you just visit your local computer store, or call 1-800-343-5414. (In Massachusetts call 617-492-7870.)

Lotus

The hardest working software in the world.

1-2-3 and Lotus are trademarks of Lotus Development Corporation.
*Based on Soford, Softalk Best Selling Software Lists, 1983.

1-2-3 from Lotus. Maybe the best way to look out for number one is to go with number one.

SOFTWARE

HEWLETT-PACKARD CO.
Lotus 1-2-3, Context MBA for HP 150; Financial Calculator

Hewlett-Packard Co. has announced that Lotus Development Corp.'s Lotus 1-2-3 and Context Management Systems, Inc.'s Context MBA are available for its HP 150 touch-screen personal computer.

The vendor has also introduced its own Financial Calculator, which turns the HP 150 screen into an HP 12C financial calculator. All the features and programming capabilities of the Financial Calculator can be used with the HP 150.

The Lotus 1-2-3 is priced at $500, Context MBA is $695 and the Financial Calculator is priced at $75.

HP, 3000 Hanover St., Palo Alto, Calif. 94304.

STSC, INC.
APL-Plus/PC

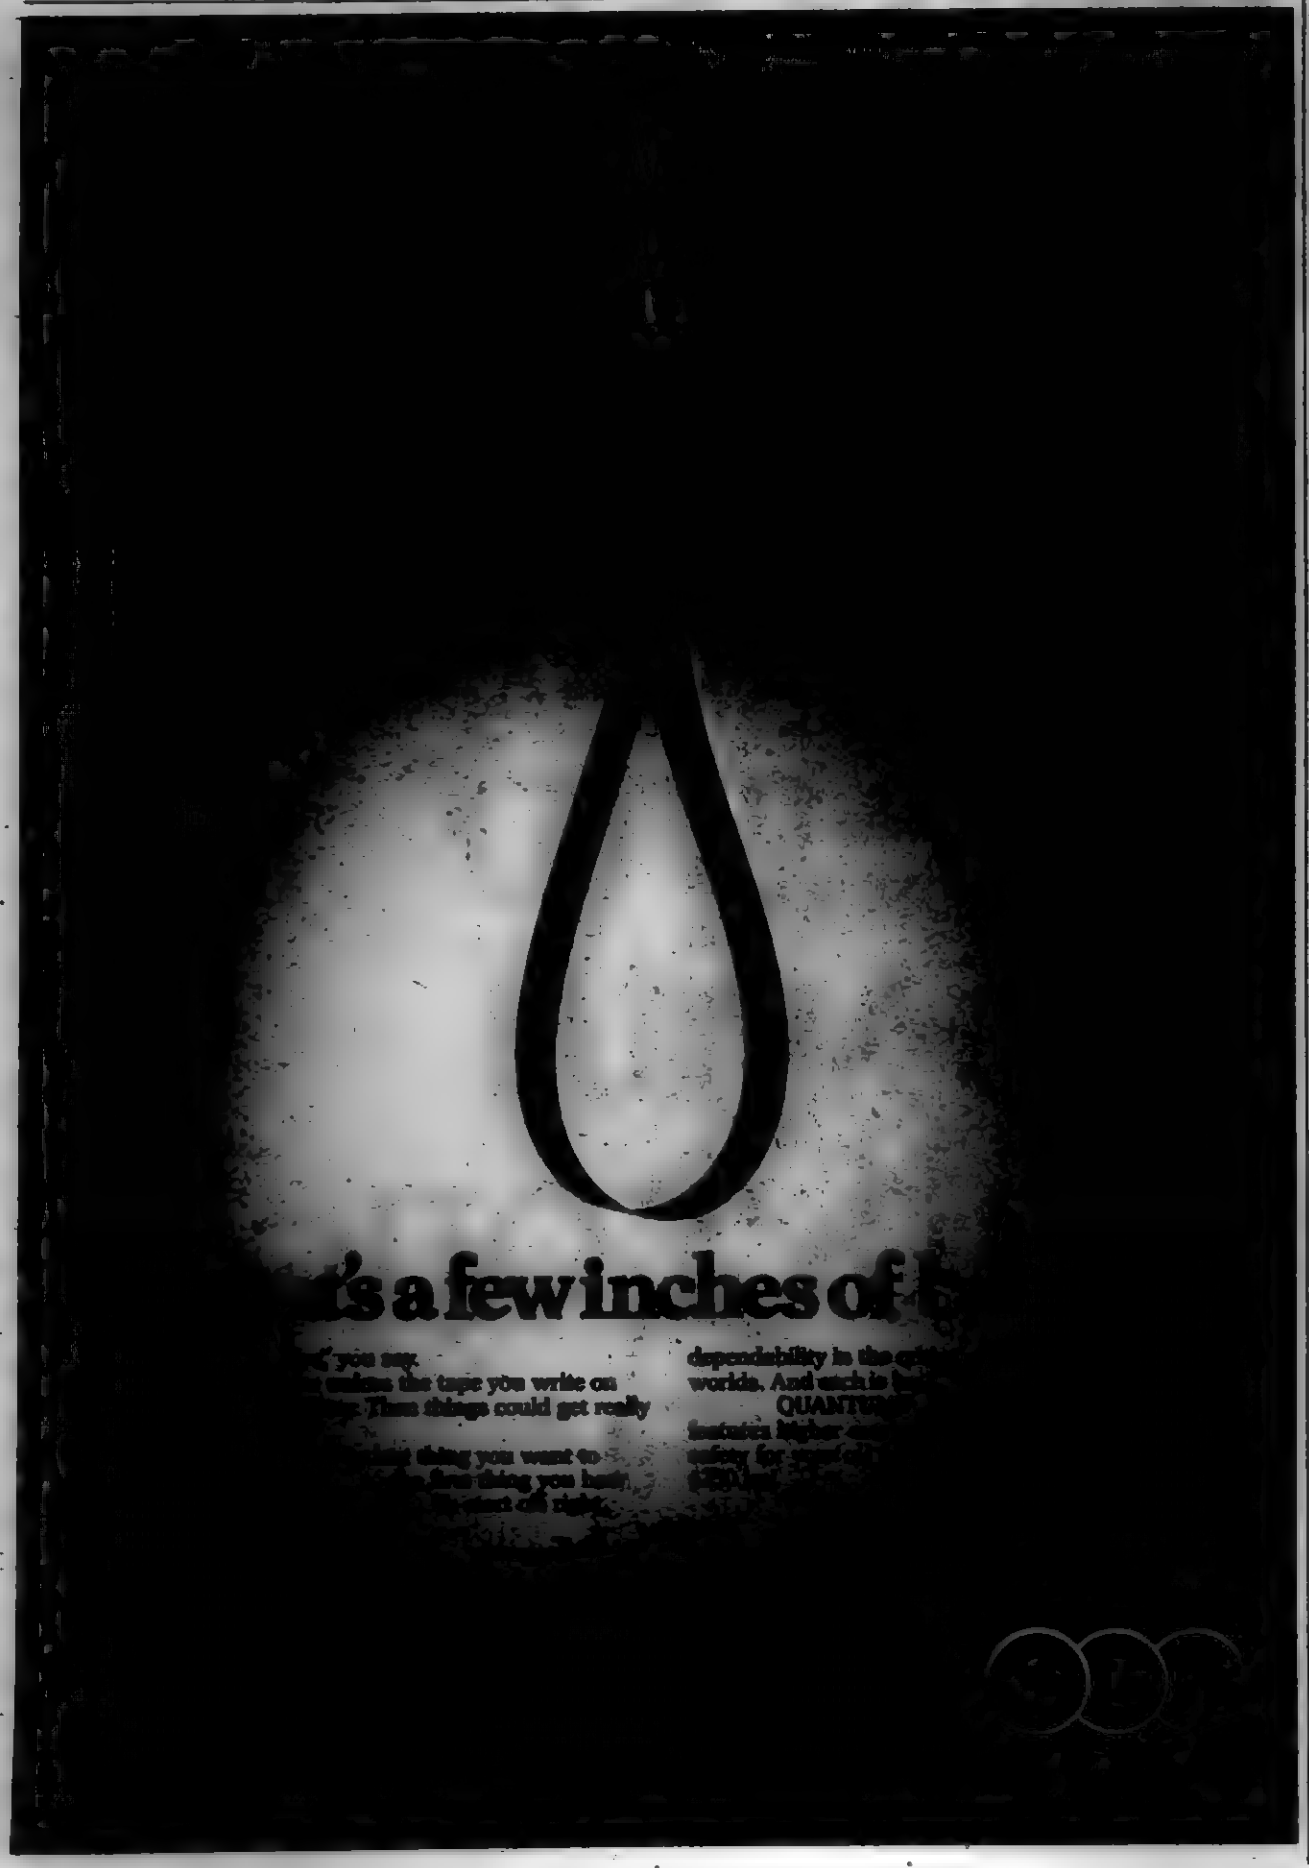
STSC, Inc. has introduced a financial and statistical package containing more than 200 programs for the IBM Personal Computer and other compatible machines.

The APL-Plus/PC financial and statistical library includes routines to perform financial calculations, forecast time series and compute statistical measures. Programs include six different types of depreciation, more than 20 types of rate-of return, 10 types of forecasting and 25 probability distributions, the company said.

It runs under IBM's PC-DOS on the IBM Personal Computer or Personal Computer XT, the Compaq Computer Corp. Compaq and compatibles.

It is priced at $275.

STSC, 2115 E. Jefferson St., Rockville, Md. 20852.



DIGITAL EQUIPMENT CORP.
Protocall 350, 1000

Digital Equipment Corp. has introduced Protocall 350 and Protocall 1000, two software applications that use the telephone management system hardware option for the Professional 350 computer.

Protocall 350 allows telephone users to replace a number of functions of a desk telephone and all telephone and address reference files, such as business card files, personal phone directories and calling calendars. It automatically places phone calls using the telephone management system.

Protocall 1000 includes all the features of the 350 and also expands the smart directory functions into a personal data base system, the company said.

Protocall 350 costs $195; Protocall 1000 is priced at $395.

DEC, 146 Main St., Maynard, Mass. 01754.

APPLIED BUSINESS TECHNOLOGY CORP.
Project Manager Workbench

Applied Business Technology Corp. has introduced the Project Manager Workbench (PMW), a software package designed as a decision support system for the project manager.

System requirements are an IBM Personal Computer or Personal Computer XT with one disk drive and 256K bytes of memory. According to the vendor, the PMW integrates Gantt charts, networks and resource allocation spreadsheets.

Data entry is done by cursor control to reconfigure a plan and cut-and-paste activities across multiple projects; an optional expert mode is also featured with single keystroke commands.

The product is priced at $750.

Applied Business Technology, 76 Leight St., N.Y., N.Y. 10013.

FOX RESEARCH, INC.
Forms Manager

Fox Research, Inc. has announced an enhancement to its 10-Base relational data base management system said to permit users to format and compose documents from information stored on their IBM Personal Computer, Personal Computer XT and compatible microcomputers.

The enhancement, called Forms Manager, reportedly allows 10-Base users to create documents of any length, unrestrained by the size of their screens. It also permits forms to be filled in automatically with data drawn from the user's data base files, the vendor said.

10-Base, including Forms

MICROCOMPUTERS

Manager, costs $495 and runs on the IBM PC-DOS 2.0 or Microsoft, Inc. MS-DOS 2.0 operating systems. Existing 10-Base users may acquire the enhancement for $15.

For Research, 7005 Corporate Way, Dayton, Ohio 45459.

DATAMENSION CORP.
Report Manager 3-D enhancements

Datamension Corp. has enhanced Report Manager 3-D, a three-dimensional spreadsheet that runs on the IBM Personal Computer.

One enhancement that works with communications software allows a user to cut and paste information from any microcomputer, minicomputer or mainframe, according to the vendor. Other improvements include support of color monitors, key word search, expanded local and global formats and nested sorting capability, the vendor said.

Report Manager is priced at $495, the vendor said.

Datamension, 615 Academy Drive, Northbrook, Ill. 60062.

See SOFTWARE page 98

USE from page 88

were getting the micro-based tools they wanted, but they wanted access to the corporate data bases, too.

The information center and the personal computer are both incomplete solutions. The information center is controlled, secure and elitist, and the personal computer is spreading wildly. Information center growth is limited by tight coupling to mainframes. Micro users are stymied by the unavailability of information from corporate data bases.

These two worlds must be brought together into a better concept called the Personal Information Center. The Personal Information Center gives users the choice between using personal reporting systems on IBM 3270-type terminals and using personal computers with direct access to corporate data bases. It must be under the control of MIS because data base access must be protected by a high level of security. MIS also must control priorities on the mainframe.

The coming of the Personal Information Center has been accelerated by some important product announcements. On the hardware side, the IBM 3270-PC physically combines the 3278 and 3279 terminals and the IBM Personal Computer in one box. It offers application developers the opportunity to build more friendly applications. It does not, however, offer direct downloading from data bases to personal computer applications. For that capability, MIS directors will have to turn to software companies.

As the Personal Information Center evolves, we think it will display a number of characteristics:

- Hardware and software will be engineered for strategic use. MIS will reject hot products which can't demonstrate staying power, extensibility and high quality.
- Data base access will be well-secured but also timely and available to all qualified users, whether from a personal computer or terminal.
- Mainframe software will be able to extract data from all pertinent data bases while allowing users to select only the data they need. Users will not have to download entire files when they only want selected records from these files.
- Personal computer users will insist on extraction software that works naturally and automatically with their favorite micro programs.

It's been almost a year since my friend's call. During that time a lot has happened, including a series of meetings he's had with his division MIS director. My friend hasn't thrown away his calculator and 13-column pads. He's now working with MIS to develop a Personal Information Center, and the two analysts will be among the center's first users.

Haanes is vice-president of the New Business Division within the Software Products Group of Information General Corp.

Announcing

The one-stop, international advertising service for micro marketers.

You'll reach microcomputer buyers all over the world with *Computerworld's* International Marketing Services (CWIMS). Because we have the microcomputer market covered with an international network of publications. And what a market!

As the need for computerization in government, industry and educational systems all over the world becomes more acute, countries look to the cost-effective, adaptable microcomputer to bring them into the computer age. This means a very lucrative market for the U.S. micro marketer, since international product demand exceeds product supply.

Now, with the help of *Computerworld's* International Marketing Services, you can advertise in 15 magazines devoted exclusively to supplying information to microcomputer users in: Australia *(MicroWorld, PC World)*, Brazil *(MicroMundo)*, Denmark *(Micro Verden)*, Finland *(Mikro)*, France *(Golden, PC World)*, Japan *(PersoCom World)*, Norway *(Mikro Data)*, Sweden *(MickoDatorn, Min Hemdator)*, Spain *(Micro Sistemas)*, The Netherlands *(Micro/Info)*, West Germany *(Micro-Computerwelt, PC Welt)*. And, your advertising message can reach buyers of microcomputer products and services around the world through special micro sections in any of our 40 publications in 25 countries.

Act now—and take advantage of this international demand for microcomputer products. Whether you want to test the market—or locate a distributor or representative—our publications will put you in touch with the right people around the microcomputer world.

For more information on getting international micro coverage, call Diana La Muraglia, General Manager, International Marketing Services, toll-free, at 800-343-6474. In Massachusetts, call 617-879-0700 or return the coupon below.

SAMNA CORP.
Samna Word III

Samna Corp. has enhanced Samna Word, a word processing package that runs under Microsoft, Inc.'s MS-DOS operating system.

Features of Samna Word III include glossaries, user-defined function keys, five mathematical functions and a spelling checker. The package includes automatic indexing, section numbering, table of contents generation, keyboard-to-printer typing and support of tree-structured file-directories, the vendor said.

Samna Word III costs $650.

Samna, Suite C-1200, 2700 N.E. Expwy., Atlanta, Ga. 30345.

MICRO FOCUS, INC.
Level II Cobol compiler; Animator; Forms-2

Micro Focus, Inc. has announced that IBM will market several Micro Focus programs for use with the IBM 3270 Personal Computer. They include Level II Cobol compiler and native code generator, Animator debugger and Forms-2 source code generator.

According to a spokesman, the Level II Cobol compiler is the only General Services Administration-certified high-level Cobol for micros.

Animator is available for $800, Forms-2 for $400, Level II Cobol for $1,600, all from IBM representatives.

Micro Focus, Suite 400, 2465 E. Bayshore Road, Palo Alto, Calif. 94303.

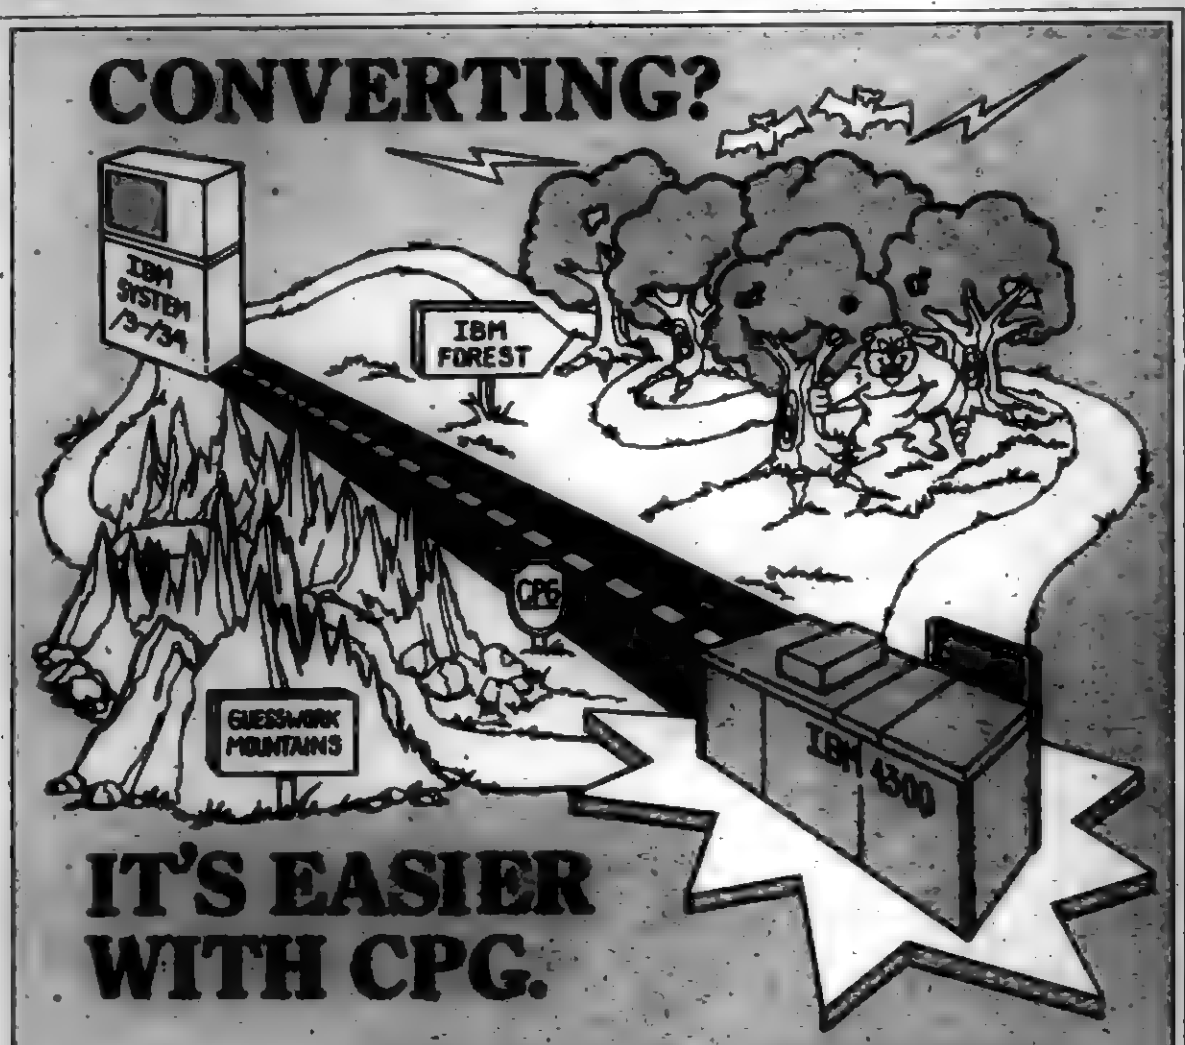
GRYPHON MICROPRODUCTS
Dbelper Part 1

Gryphon Microproducts has introduced Dbelper Part 1, a utility that assists in the writing of Ashton-Tate Dbase code. The new program reportedly allows users to set listing parameters, do macro substitution and, using the program's syntax checker, conduct error accounting.

The program also is said to produce a cross-referenced and alphabetized data dictionary of variables, keywords, constants and files. It also allows users to merge multiple procedures into a single procedure requiring no editing to run.

The program is available from the vendor for $150.

Gryphon Microproducts, P.O. Box 6543, Silver Spring, Md. 20906.



IT'S EASIER WITH CPG.

Make the move to your IBM mainframe painless and productive. Buy CPG before you convert.

CPG is the on-line program generation system from Altergo Products. It's easier to use and far more machine efficient than UFO™, MANTIS™, or TRANSIV™. It's just the system you need to prepare for a bigger machine without bigger headaches.

- CPG is easy to apply. Existing programmers become on-line experts in 1-3 days.
- CPG automatically generates optimized re-entrant, multitasking programs. Easy to create. Easy to maintain.
- CPG is powerful. Includes arithmetics & histogram output; simplifies screen-mapping & screen-editing; complex interfacing to TP system is handled by CPG.
- CPG is efficient. Standard processing routines and most common routines are incorporated into the Central Routine Library (CRL). This eliminates code duplication, loading and re-loading of common code at execution time.
- CPG programs are transportable. The CRL allows programs written in CPG to work under DOS or OS and run under CICS or SHADOW II.
- CPG is user-responsive. It allows you to develop, test and implement on-line systems in less than half the normal time at the terminal before the user's eyes.

Whether converting or simply looking for an easy way to meet the on-line workload, go CPG. Go Altergo. Call for more information today.

"The first programming tool I've ever eaten. Even with CPG."

SHOP from page 83

the first month, the company now mails out about 30 packages per day, according to Lynch. About 80% of The Programmer's Shop's customers are divided evenly between commercial software developers and programmers in Fortune 1,000 companies, with consultants making up the difference. Previously, many of those clients had worked through high-volume mail-order houses or directly with manufacturers to obtain software like linkers, compilers, editors and debuggers. The Programmer's Shop maintains a stock of about 80 products and claims to have ready access to 300 more.

Of equal importance to many users are the firm's evaluation criteria. About 70% of the inquiries that come into The Programmer's Shop ask for product literature, which the retailer sends out in abundance. Customers who call the company offices can get a critical evaluation of various packages, although the evaluations are not made publicly available, Lynch said. The Programmer's Shop also maintains a list of products it has found to be "real junk," he said.

The firm is now trying to establish an information-sharing network for customers. Users typically contribute ideas and opinions to the electronic bulletin board and newsletter, and Lynch is working to put together a compendium of benchmark results submitted by customers. The results will be distributed free on diskette to anyone who contributes, he said.

The concept of this kind of specialization has apparently succeeded because programmers have a much greater stake in the quality of the software they buy, Lynch said. "A typical micro programmer might use his micro six hours a day or more," he noted, "whereas someone using Wordstar might use his machine for a half-hour."

Customers seem to concur that the clearinghouse is worthwhile. "I basically don't buy from anybody unless I buy from them," said Peter Norman, a consultant with Project Technology, Inc. in Cambridge, Mass., who said he has bought nearly 100 packages from the company. "We get a pretty good discount, and they also know something about software. They're by no means perfect, but they're so much better than anybody else."

Another customer agreed. "They're probably one of the best software vendors we've found," said Ray Ostolski, manager of Engineering Management Systems in the Apparatus and Engineering Services Operation at General Electric Co. in Schenectady, N.Y.

The Programmer's Shop uses a method to evaluate software without actually plugging it into a machine, Lynch said. Potential suppliers fill out a form detailing their experience, special features, documentation and other information. Lynch said he can scan the sheet and make a preliminary evaluation "in about 30 seconds." Technical specifics, he said, are the key.

"Products usually deliver to technical claims, but not to marketing claims," he said. "In order to get a good idea, I eliminate everything except the market leader. Then I compare everything else with that."

The Programmer's Shop is located at 908 Providence Highway, Dedham, Mass. 02026.

Fujitsu: answer to PCM prayers?

If you like coincidences, then you just had to get a kick out of the two Amdahl Corp.-related announcements a week and a half ago. The same day Amdahl announced two 6000 series disk drives to compete with IBM's 3380 product, it was announced Fujitsu Ltd. had boosted its ownership in Amdahl to just under 50%.

The disk drives announced by Amdahl, the Models AA4 and B4, are both reportedly manufactured by Fujitsu, and the betting is that before too long all Amdahl products will be value-added versions of Fujitsu products.

"Fujitsu has done reasonably well manufacturing disk drives on an OEM basis," Dale Kutnick, executive director of The Yankee Group, said following the Fujitsu stock announcement: "There is an opportunity there, particularly with the decline of the U.S. disk makers . . . if Fujitsu can get its act together."

The effective takeover could provide a much-needed spark to the entire plug-compatible market. Fujitsu has an array of products spanning the whole spectrum of information processing requirements, from personal computers to supercomputers. It also has reported revenues in the $4 billion range, a very healthy position from which to twitch the nose of IBM. Certainly, Fujitsu appears to have potential staying power that others in the field lack.

Computer industry analyst Bill Easterbrook, of the investment firm of Kidder Peabody and Co., Inc., noted, "Fujitsu has financial resources and

'Simple' maker files Chapter 7

Facing $4 million debt

By Paul Kenenbaugh
CW Staff

LEXINGTON, Mass. — The worst fears of 49 employees of Data Concepts International, Inc. were realized March 5 when Thorpe Wright, company president, announced the company was filing for liquidation under Chapter 7 of the Federal Bankruptcy Act.

Faced with approximately $4 million of debt, hounded by 154 creditors and unable to attract sufficient capital to continue operations, the company turned over to the court its assets, including Simple, an application generator for Motorola, Inc. 68000-based systems.

Founded in 1975 by Wright, Calvin Moore and Andrew Diamond, Data Concepts, Inc. began developing a programming language and an application generator. "Initially, we had $10,000 to finance the company," Wright said.

In early 1982 with Trace, the programming language, and Simple, the application generator, completed, the company attracted $1 million in venture capital and changed its name to Data Concepts International.

"To demonstrate the application generator's power, the company chose to market the product to insurance companies and develop commercial line systems," according to a former employee, who asked not to be named.

Commercial lines represented the last principally manual insurance application. Software for the task had to be flexible enough to use a series of complicated tables and rates, while providing an on-line data base and real-time updating.

Data Concepts approached a number of insurance companies and offered them, at a fixed cost, a custom-designed commercial line system. But contract specifications did not define the system. "The company gave the users carte blanche reign," the former employee said. "Whatever they

IBM, AT&T seen squaring off

By John Gantz
CW Staff

NEW YORK — Battle lines are being drawn between titans AT&T and IBM, and the imminent confrontation will be waged for the most part in the automated office.

That was the message delivered at a Gartner Group conference, titled "AT&T and IBM: The Battle Begins," held here last week. The two-day conference examined the perceived strengths and weaknesses of the two companies, as well as the markets in which they are likely to butt heads.

AT&T, it is believed, will try to leverage its dominance in the communications industry to enter the markets for computing and office systems equipment.

According to Stephen P. Cohen, vice-president and director of Gartner's Industry Service, AT&T's ultimate goal is to become an end-to-end information products and services company that will "provide an alternative to IBM where appropriate and coexist with IBM where necessary."

AT&T strengths that will aid that bid include, among other things, an enormous financial presence, large personnel resources and demonstrated manufacturing prowess, Cohen said. He also praised AT&T's "apparent newfound corporate flexibility in its willingness to fill gaps in its product line from external sources."

Weaknesses that AT&T must overcome,

Developers of reusable code get a second chance

By Paul Gillin
CW Staff

WELLESLEY, Mass. — The world will take little note of the passing of Readycode from the software market.

Introduced in 1981 by Raytheon Computer Services, the product incorporated an advanced technology called reusable code, but it enjoyed only limited success. After nearly three years on the market, Readycode had only about 20 users.

But Readycode is not gone from the scene. Enhanced and renamed Programaster, the product is now being marketed by a small company here that spun off from Raytheon Computer Services early this year.

Master Software, Inc. was formed when a group of Raytheon employees this year acquired venture capital and bought Raytheon Computer Services for $3 million, although Raytheon Co. still maintains a 20% share in the new company.

The firm's Programaster employs reusable technology to generate large-scale application programs on IBM mainframes, according to Larry Martin, former general manager of Raytheon Computer Services and president of Master Software.

Freed from the administrative burden of a massive parent company, Master Software hopes to be more successful at establishing an identity for reusable software. Programaster uses a Readycode base but employs such enhancements as full screen editing and improved data base access, as well as access to IBM Vsam files and an upgrade from Cobol 68 to Cobol 74.

Martin

The viability of reusable software is based on the generally accepted view that 80% of all business software code has been written before. If commonly used modules are made reusable and tied together through structured designs and logic structures, productivity improvements of up to several hundred percent can be realized, advocates argue.

Martin said the limited success of Readycode was not due to weaknesses in the product so much as to the difficulties of promoting a new and poorly understood technology within a large company. "Raytheon was a $6 billion company with a $3 million piece selling Readycode," he said in a recent interview. "In a company that size, the approval cycles are so long that it is very difficult to get things done."

Despite its apparent productivity benefits, reusable software has been only mildly successful. A major reason is that the concept is still poorly understood by most technicians, Martin added. "We didn't position Readycode well," he said. "We went first into the marketplace for productivity tools and then later switched and moved into code generation. The problem with having a product that is like little else in the market is that you have to fit yourself into somebody else's definition."

However, the concept is beginning to gain respect, according to Martin. "Two years ago it was almost impossible to get anybody to talk about [the concept]," he stated. "But recently, we've seen our sales cycles drop dramatically." Users now appear more willing to invest in this technology, he said.

Master Software still faces a formidable task. Its primary competition comes from established vendors of fourth-generation languages and application generators. However, Martin believes the line between those tools and reusable software will become clearer as the technology becomes better understood.

Master Software intends to promote the concept of a "reusable architecture" with an on-line version of Programaster, a screen generator and a tool oriented toward managing development.

U.S. officials decry Japanese copyright plan

By Robert Hott
CW West Coast Bureau

TOKYO — Top U.S. government officials are currently locked in urgent negotiations with Japanese authorities here in an attempt to forestall a crisis over software copyright protection.

The U.S. team arrived here recently as the deadline over a controversial proposal from Japan's Ministry of Trade and Industry (Miti) drew near. The Miti plan calls for replacing current Japanese copyright laws with a 15-year protection. It would require U.S. software houses to license and disclose their program code before a software product could be sold in Japan when the ministry deems such software to be "important to public welfare."

The proposal has led to an outcry from American electronic and computer trade associations, with U.S. officials threatening to retaliate by removing copyright protection from Japanese software sales in the U.S. Currently such software is protected for 75 years.

Top U.S. trade negotiator Clyde Prestowitz, assistant to Commerce Secretary Malcolm Baldrige, has also warned that action might be taken against sellers of Japanese software in the U.S., under domestic trade laws, if the Miti proposal is implemented.

Industry and government officials had hoped the controversy would be resolved at a recent meeting of the U.S.-Japan Work Group on High Technology Issues here, but instead Japanese officials imposed a March 27 deadline for submission of a draft proposal to the Japanese legislature.

"While we had been optimistic that the proposal from Miti would sink quietly beneath the waves, it appears the issue is still unresolved, and we are continuing to push for U.S. software interests," commented Charlotte LeGates, information officer for the Computer and Business Equipment Manufacturers Association, which has been lobbying the Reagan administration to fight the proposal.

The March 27 deadline sent U.S. officials, headed by Prestowitz, scurrying back to the Japanese capital for a new round of negotiations.

"We have continually expressed our opposition to the Miti proposal. The essential issue here is one of international law," commented Maureen Smith, director of the Office of Japan at the Commerce Department in Washington, D.C.

Smith said Miti is attempting to gain jurisdiction over the software industry in Japan with a law that would place software products outside conventional copyright protection.

"The law they are proposing is not a copyright law. Once software is covered by some other law, the Japanese will no longer be subject to international copyright agreements, and there is nothing to stop them [from] amending the arrangements to suit their needs," she contended.

The Miti proposal has also reportedly sparked a fierce fight for political power inside Japanese government circles. Currently, software copyright is administered by the Ministry of Education, which has issued a counterproposal to the Miti plan via its Copyright Council.

The Ministry of Education plan, which would offer copyright protection for software for a period of 50 years, is being backed heavily by U.S. trade associations and the Commerce Department.

Go beyond equipment compatibility.
Reach for total performance.

The Zenith Z-100 PC's.

In the white heat of the slalom, something clicks: skier and skis meld into one, and hurtle toward total performance. And, in your office, you'll experience that same kind of oneness with our new IBM-compatible Zenith PC's.

Their enhanced features actually take you beyond IBM compatibility. Like internal expandibility that allows you to add peripherals without adding size. Storage that can expand up to 11 megabytes. The ability to run virtually all software designed for the IBM PC. And a detached keyboard with a "smarter" key layout for added convenience.

Tymshare deal to tie info group

ST. LOUIS — McDonnell Douglas Corp., which is in the process of acquiring Tymshare, Inc., announced recently it will combine Tymshare with three of its other subsidiaries into a $1 billion Information Systems Group.

Tymshare, operator of Tymnet, is in the process of being acquired through a stock tender offer that expires at the end of the month. McDonnell said it would combine Tymshare with McDonnell Douglas Automation Co. (McAuto) of St. Louis; Microdata Corp. of Irvine, Calif.; and Vitek Systems, Inc. of St. Louis.

McDonnell's president, John F. McDonnell, will assume the additional position of chairman of the new group, which will combine a total of about 12,000 employees and is expected to have sales in 1984 of $1 billion, a spokesman said. Other members of the executive board for the new group will be Robert A. Fischer, president of McAuto, and Gary E. Liebl, president of Microdata.

The first vertical industry business to be established in the group will be McDonnell Douglas Health Systems, Inc., comprised of the Health Services Division of McAuto and all of Vitek, which makes automated laboratory testing equipment.

How 3 famous names got together to

SOLVE YOUR PROBLEMS OF INTELLIGENT MICRO TO MAINFRAME CONNECTION.

Get the answers you're looking for—with the VisiAnswer Software System from Informatics, the leader in mainframe to micro integration.

Informatics has teamed the best minds in the business to solve the problems of intelligent mainframe data access for microcomputer users. The VisiAnswer™ Software System is the breakthrough result of a unique team involving Informatics Corporate Micro Systems and VisiCorp™ products working with IBM® Personal Computers.

VisiAnswer solves the timely problems plaguing data processing professionals like you.

Available for use right now, the VisiAnswer Software System is the micro to mainframe system specifically designed to help you:

- Manage *and* control the integration of microcomputers with your current mainframe—right in *your* data processing department.
- Provide your company's micro end-users with access to specific mainframe data—without wading through unrelated information for hours.
- Maintain *security*/control of restricted portions of your corporation's data.
- Supply end-users access to *current "live" information*, instead of information that's historical and obsolete.
- Intelligently access *all* mainframe data, whether it's unique application data or part of a data base management system.

VisiAnswer makes your job easier and more efficient than ever.

With more and more managers and analysts in your company using desk-top computers these days, there's a tendency to improvise the way they obtain the data they need. That leaves the door wide open for mistakes and inaccurate information.

Now you can avoid these problems and maintain a high level of data-processing efficiency for everyone who needs access to that data with the VisiAnswer Software System. It delivers intelligent solutions that make current mainframe data available to your end-users in an orderly fashion. That makes their jobs *and yours* easier and more accurate—something upper management will appreciate.

VisiAnswer was designed by the best minds in the business to fit your business.

You get Informatics' expertise in data access technology and mainframe system software... plus VisiCorp's expertise in user-friendly micro software. We chose the IBM Personal Computer for its leadership in delivering business solutions, and IBM chose us as a value-added remarketer.

This system works with *all* data bases on IBM mainframe systems. And your end-users will get data that is immediately usable with all Visi Series™ Products and other products utilizing the VisiCalc® file format.

Find out more about Informatics VisiAnswer system. Mail this coupon or call toll free today. See how VisiAnswer products can fit into your Personal Information Center as an integral part of your unique business strategy.

TELETYPE CORPORATION.

WHAT'S NOW IN FRONT OF OUR NAME IS ALSO BEHIND US.

AT&T

Teletype Corporation

At Teletype Corporation, we've changed our logo. But as a part of the AT&T family, our commitment to supplying you with the latest in communications products and services hasn't changed.

With our own sales and marketing force, service organization, manufacturing facilities and distribution network, we're in an ideal position to meet all of your needs. And with the ingenuity of our expanding R&D, we're developing the kinds of terminals and systems the Information Age demands.

Today, our full line of printers and CRTs fit a wide variety of applications—from simple message transmission to sophisticated programming. Each and every terminal boasts user-friendly features that exemplify traditional Teletype Corporation quality.

We're also actively branching out into new areas such as intelligent terminals. Our 5620 intelligent graphics terminal, for example, is indicative of the kind of terminals you'll be working with in the future. It's a UNIX*-based CRT that can perform up to six functions simultaneously.

But while we're exploring new areas, we're also improving the products that have earned Teletype Corporation a strong reputation for value. Take our 5540 line of terminals. It represents our third generation of 3270-compatible devices. And we're continually adding to it, developing new displays, printers, keyboards and controllers to enhance the cost-effectiveness of your system.

Now that you've seen our new logo, it's time you took a closer look at what we can do for you. To find out more about our products and services, write Teletype Corporation, Dept. 3223-F, 5555 Touhy Ave., Skokie, IL 60077. Or call **1-800-323-1229, ext. 932.**

U.S. officials optimistic about trade with NTT

By John Giuliano
CW Washington Bureau

WASHINGTON, D.C. — High-level U.S. trade officials and several American businessmen said recently they are confident U.S. firms will increase sales to Japan's Nippon Telegraph and Telephone Public Corp. (NTT).

The two countries earlier this year renewed a three-year agreement aimed at facilitating American sales to NTT. The new pact contains a number of proposals the U.S. requested to make the agreement more effective. Sales in 1983 were an estimated $142 million, a threefold increase over 1982. NTT's annual high-technology procurements exceed $3 billion.

U.S. Ambassador William E. Brock, the U.S. trade representative, told the House Subcommittee on Telecommunications, Consumer Protection and Finance that the negotiations leading to the pact's renewal were "an unqualified success" for the U.S. He added that the agreement will lead to greater sales if there are "well-planned and aggressive sales activities by U.S. firms and good faith efforts on the part of NTT."

Commerce undersecretary Lionel Olmer, who heads the department's International Trade Administration, which is responsible for implementing the agreement, said he believes NTT is interested in getting the best equipment at the best price, no matter who provides it, and does not see its main responsibility as furthering government high-technology protectionist policies.

"NTT should not be painted with the brush of Japanese industrial policies," according to Olmer, who said he is "strongly optimistic" about sales to NTT. "We are today on a better footing with NTT than ever before, and our companies support this view without exception," he told the subcommittee.

Providing a businessman's view of NTT, Charles P. Lecht, chairman of Lecht Sciences, Inc., a New York software developer, said he just completed successful negotiations with NTT to sell them Lecht Sciences' educational software products.

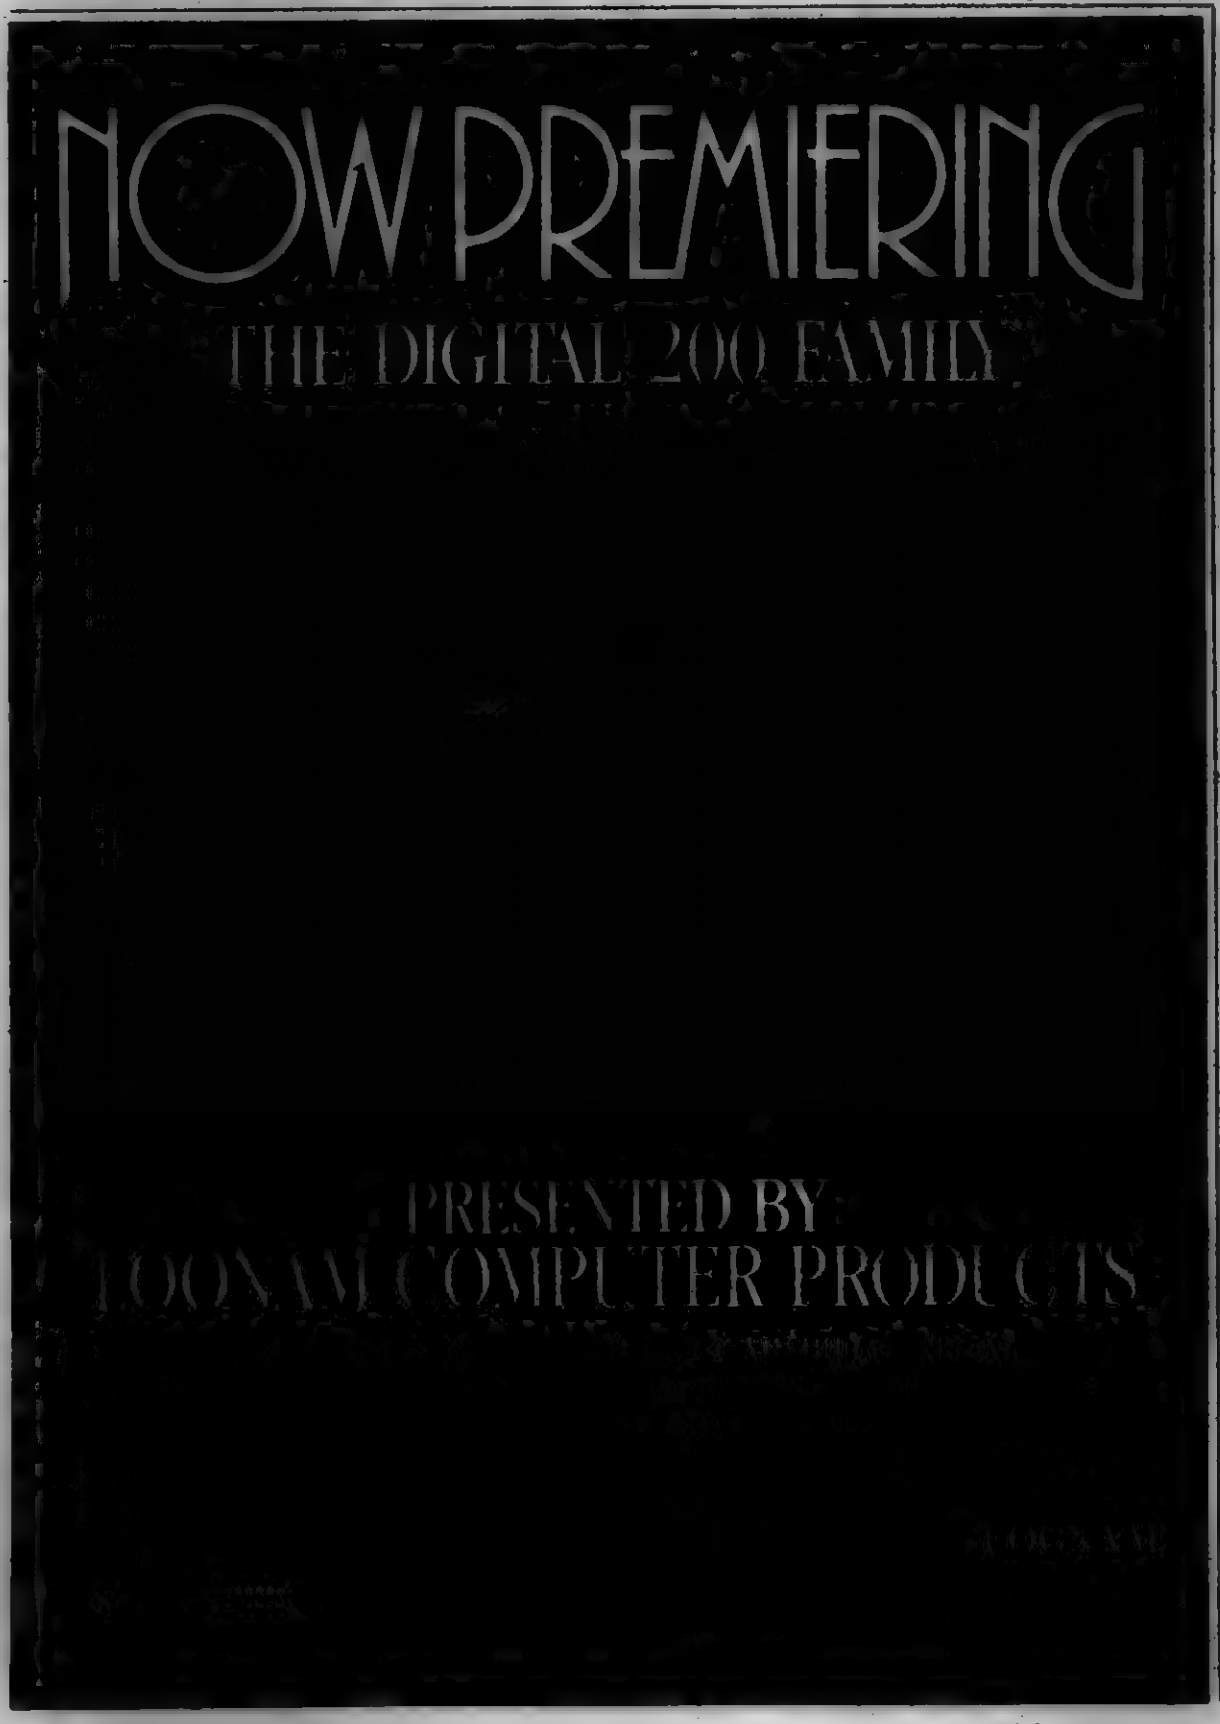
"I found NTT to be a tough but fair negotiator who knew exactly what it wanted and what it wanted to pay. . . . In the end, we both made some compromises and concluded a fair contract," Lecht told the subcommittee.

Lecht said, "Japan is not a closed market, and NTT is not impossible to deal with. What barriers exist are no greater than similar barriers in other nations. In my experience, contract negotiations even with our own government can be complex and drawn out."

He added that his company benefited from his previous business experience in Japan and expert outside counsel during the contract talks with NTT. Lecht complained that there seems to be little U.S. government assistance for small companies seeking business opportunities in that country.

In reply to a question from subcommittee chairman Tim Wirth, (D-Colo.), Lecht said he is concerned about the growing criticism in the U.S. of Japan. "The impact of very negative propaganda regarding the Japanese government and its business practices . . . may serve to undermine the enthusiasm of U.S. firms" that might want to sell to Japan, he suggested.

He also noted that the criticism of Japan may "embarrass" the Japanese and seriously poison cultural and business relations between the two countries.



Bell Labs chip supports Unix

SAN FRANCISCO — AT&T's Bell Laboratories recently announced a second-generation, 32-bit microprocessor said to take advantage of the Unix operating system and planned to be used in a series of AT&T 3B computers.

The chip, called the WE 32100, is the successor to the WE 32000, which was formerly known as the Bellmac-32A. It reportedly contains 180,000 transistors, about 30,000 more than the earlier chip, and uses Cmos technology.

"We have integrated many support functions onto the chip," said Hing C. So, head of the Very Large-Scale Integration Department at Bell Labs. "We have also added features such as an internal cache memory and have increased the speed of the chip."

The cache memory reportedly can hold 64 32-bit words, and repeatedly used program instructions can be stored there so there is no waiting time, a spokesman said.

The WE 32100 reportedly operates at speeds up to 14 MHz, is packaged in a 132-pin package and dissipates approximately 1.9W in worst-case conditions.

Commerce official cites flaws in Japan's targeting

By John Kirshner
CW Washington Bureau

ACAPULCO, Mexico — Japanese government efforts to target certain industries for support and promotion have caused that country "terrible trouble," according to a U.S. Commerce Department official, who said recently that the U.S. computer industry should not be overly worried about Japanese competition.

Dr. D. Bruce Merrifield, assistant secretary of Commerce for Productivity, Technology and Innovation, said "the idea is great; the concept is beautiful, but there are two basic flaws" with such targeting.

Merrifield, who addressed the Computer Dealers and Leasors Association (CDLA) conference here recently, said the first mistaken assumption about industry targeting is that "the world is stupid and won't try to emulate you." Using the Japanese steel industry as an example, he noted that initial successes in capturing large parts of that market worldwide were followed by similar efforts by other countries, such as Korea.

Now, the world steel industry is overbuilt and operating at only half capacity, according to Merrifield. He said the situation is "a good, living, breathing example" of how "no bureaucrat knows how to target anything."

The other basic flaw of targeting, he continued, is the assumption that once a country has taken over a market, the market will last long enough to pay back the huge initial investment needed to achieve market supremacy. The danger, he said, is that targeting will "destroy an industry for everyone," leaving the targeters saddled with "an enormous debt load" that cannot be covered by future sales.

Turning to Japanese targeting of computer-related industries, Merrifield told the CDLA audience that the Japanese will be successful in continuing to build their high technology industries. But, he added, the world market is so big that it will benefit both Japan and the U.S. He called for "collaborative efforts" between the two nations, predicting "a very powerful, complementary relationship ultimately."

Discussing other U.S. competitors, Merrifield suggested mainland China will "be at the leading edge of everything at the end of the century." The Chinese "are determined and capable people," Merrifield said, noting how rapidly they are trying to assimilate Western technology and management practices.

Asked about China as a competitive threat to the U.S., Merrifield said, "I really am not worried. . . . It's not us against them." According to Merrifield there will be such a large market for high-tech products, particularly among the currently developing nations, that there will be great opportunity for all high-tech producers.

Assessing current U.S. competitiveness, Merrifield said, "We can reclaim and maintain our leadership in every area if we just get our act together." He said the U.S. "has incredible advantages over everybody."

Chief among those advantages, Merrifield said, are the most advanced technology in the world, the most readily available development capital and "a remarkable entrepreneurial culture."

However, he said, the U.S. needs to remove barriers to the increased competitiveness of American industries. Although "the last thing we need is to get the government in there funding or managing anything," he said the government can be a catalyst for industry development, by providing incentives for and removing regulatory impediments to industrial developments.

If you sell large systems software — quick — what will all your prospects be doing on June 20, 1984?

They'll be looking through a great new reference guide to software vendors — the *Computerworld Buyer's Guide to Large System Software* being published on June 20. And you'll definitely want to be there.

Look at what the Buyer's Guide gives you:

You get a large audience with heavy purchasing responsibilities — more than 114,000 paid *Computerworld* subscribers in the U.S. These subscribers are concentrated in the large professional computer-using organizations that control 84% of DP/MIS spending in 1983 — $72.2 billion. And research shows these subscribers have a significant degree of purchase decision influence — ask your Buyer's Guide sales representative to show you the *Computerworld* reader profile for details.

Look at what the Buyer's Guide gives buyers:

They get a one-source, comprehensive listing of purchase information about applications, DBMS, and systems and utility software for use with mainstream data processing systems. They get **two kinds** of listings — vendor listings and product offerings. **And**, they get a whole range of feature articles and tutorials covering new technology, large system software trends and buying techniques.

Now that you know where software buyers are going to go next June, you can arrange to be there with an ad for your product or service — right when they're researching vendors! Ad deadline is May 4. To reserve space in this issue, call one of the sales offices listed below or call Ed Marecki, National Sales Director or Kevin McPherson, Product Manager.

Zilog, NEC resolve differences in chip dispute

CAMPBELL, Calif. — Zilog, Inc. and Nippon Electric Co., Ltd. (NEC), involved last year in a bitter dispute involving Zilog's Z80 microprocessor and certain NEC patent claims, have resolved their differences and agreed to licensing arrangements.

Zilog, a subsidiary of Exxon Corp., announced recently it has granted NEC the first license to manufacture and market its Z80,000 32-bit microprocessor.

The alternate source agreement provides NEC with nonexclusive rights to manufacture and market the Zilog product worldwide.

Last year (CW, Aug. 8), Zilog had asked the U.S. International Trade Commission (ITC) to investigate alleged unfair competition by NEC and two U.S. subsidiaries, NEC Electronics U.S.A., Inc. and NEC Home Electronics (U.S.A.), Inc.

Earlier suit

Zilog had earlier in the year filed suit in federal court seeking $40 million in damages based upon charges that NEC and its subsidiaries had copied the Z80 circuits and imported them into the U.S. in the NEC UPD780 and UPD780-1 microprocessors.

NEC Electronics subsequently countersued for $40 million, charging that 14 Zilog parts infringed on NEC's U.S. patents.

Under terms of an agreement announced earlier this year, the companies filed a joint motion with the ITC proposing the pending investigation be terminated, and an administrative law judge issued an initial determination to do so, which has now become final, the companies said.

At that time, the companies said Zilog would receive a license to manufacture certain NEC products, and NEC would receive licenses to manufacture the Z80 and certain other Zilog products.

Other terms of the settlement would remain confidential, the companies said.

Announcing the Z80,000 agreement earlier this month, Franc R. J. deWeeger, president of Zilog, said, "NEC is one of the few companies with a process technology sufficiently advanced to make a product as complex as the Z80,000 CPU."

The 32-bit microprocessor, announced midway through 1983, will be available in "first samples" during the first quarter of 1985, Zilog said. Additional sources for the chip will be named in the future, deWeeger said.

How Dan Feeney Made The Micro To Mainframe Connection

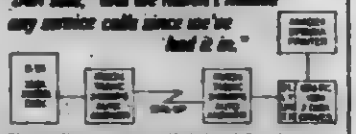
Dan Feeney, systems manager at Abrams/MBI Products in Morris, Ill., decided that line charges on one of his IBM model 12 terminals were too high. His firm's corporate headquarters in Chicago was using it to print sales and price reports from the plant's S/34 in Morris and to do online financial modeling.

A PC, Dan reasoned, could do the modeling with any one of the spreadsheet programs available and the reports could be "bicycled" the 50 miles to Chicago. Dan had the terminal removed and bought a PC. The executives were initially pleased with the new system.

"After a period of time the Chicago management missed the communications with the plant," Dan said, "Each week there's a deadline and they must have the reports the same afternoon we produce them. Couriers just couldn't get the reports there in time."

Dan began to question his prior decision to get rid of the headquarters terminal. He looked around for a way to restore communications without having to put the terminal back in. After looking at what was available, he decided to try the BLUE LYNX package.

"It worked the first time we tried it," Dan said, "and we haven't needed any service calls since we've had it in."



Phone line costs are minimal for the BLUE LYNX equipped PC when compared to the charges on the model 12 that was previously in the headquarters office. Also, the total cost of the PC with BLUE LYNX was much cheaper than that of the terminal and printer. Seven hours a day the PC is now off-line running the spreadsheets. The on-line report printing takes only a short time with a 2400 baud rate running over switched lines.

IBM 3270/12 emulation for S/34, S/36 and S/38 users. IBM 3276 emulation - SNA/SDLC or Bisynch 3680 complete. Combination of 2 emulators $1230.
VT320M - DEC VT100/52 emulation software package (requires IBM Adapter) $125

IDC chairman sees boon for remarketers

'Massive opportunity' for lessors, dealers

By John Kirshner
CW Washington Bureau

ACAPULCO, Mexico — Economic and technological trends indicate steadily growing business opportunities for third-party computer dealers and lessors, International Data Corp. (IDC) Chairman Patrick J. McGovern said recently. Delivering the keynote address to the recent Computer Dealers and Lessors Association (CDLA) meeting here, McGovern said an increasing demand for computer applications and a shortening life cycle for computer equipment are creating "a massive opportunity" for lessors and dealers.

McGovern

Citing IDC statistics, McGovern said there will be a 33% annual growth rate in systems sales through 1987. In the short term, he said, the computer equipment installed base will rise from last year's $123 billion to $264 billion in 1987.

In that four-year period, he predicted, mainframe sales will increase 6% per year, minicomputers 20%, small business computers 49% and peripherals approximately 19%. New, lucrative markets are arising in banking systems, particularly for automated teller machines — which numbered 36,000, worth $1 billion at the end of 1982, and will number 151,000, or $3.7 billion, at the end of 1987 — and in factory automation, which is growing at a 27% annual rate, he said. In addition, McGovern noted the independent software market is growing rapidly, climbing from $1.2 billion in 1980 to $4.5 billion in 1985 and $12.8 billion in 1990. With the cost of software rising relative to the cost of hardware, more and more users will want to spread the costs over the life of the system, which, according to McGovern, means greater opportunities for computer lessors.

Among other changes IDC expects will be an increased importance of software developers and small systems houses, which, he said, will be repackaging and selling 50% of the value of small business computers delivered in 1990.

In general, McGovern concluded, "the environment we sell to today is going to look dramatically different over the next decade." As spending for computers and related equipment becomes an increasingly greater portion of the U.S. gross national product, corporations will be taking a harder look at acquisition strategies and related government tax policies, he said.

"The end user is much more sophisticated" about the financial aspects of procuring hardware and software, he said. The result will be greater business opportunities for dealers and lessors, McGovern maintained.

IPL Systems suffers $4.2 million net loss for 1983

WALTHAM, Mass. — IPL Systems, Inc. recently reported a net loss of $4.2 million for the year ended Dec. 31, as revenues dropped $5.1 million from the level reported a year earlier.

The company reported 1983 revenues of $9.9 million, compared to $15 million the previous year, and a $4.2 million loss, compared to a profit of $277,000 the previous year. Per-share losses were 35 cents, compared to earnings of five cents per share for 1982.

For the fourth quarter, the company posted revenues of $2.2 million, down from $2.5 million in the corresponding period a year earlier, and a net loss of $3 million, compared to a loss of $1.1 million in the corresponding quarter one year ago.

Net earnings for both the year and the quarter, the company said, reflect an income tax benefit resulting from a net operating loss carried back and the utilization of previously unused losses to offset previously provided deferred tax credits. Without those provisions, the company's losses would have totaled $3 million for the fourth quarter and $7 million for the year.

Revenues suffered from delays in shipping the company's Model 4430 Continuous Compatible Computer, intended to compete with the IBM 4361 and IBM 4381 computers, a spokesman said. The company also said it believed sales were adversely affected by several factors, including the "lingering effect of the past economic downturn," potential customers holding off their purchase deci-

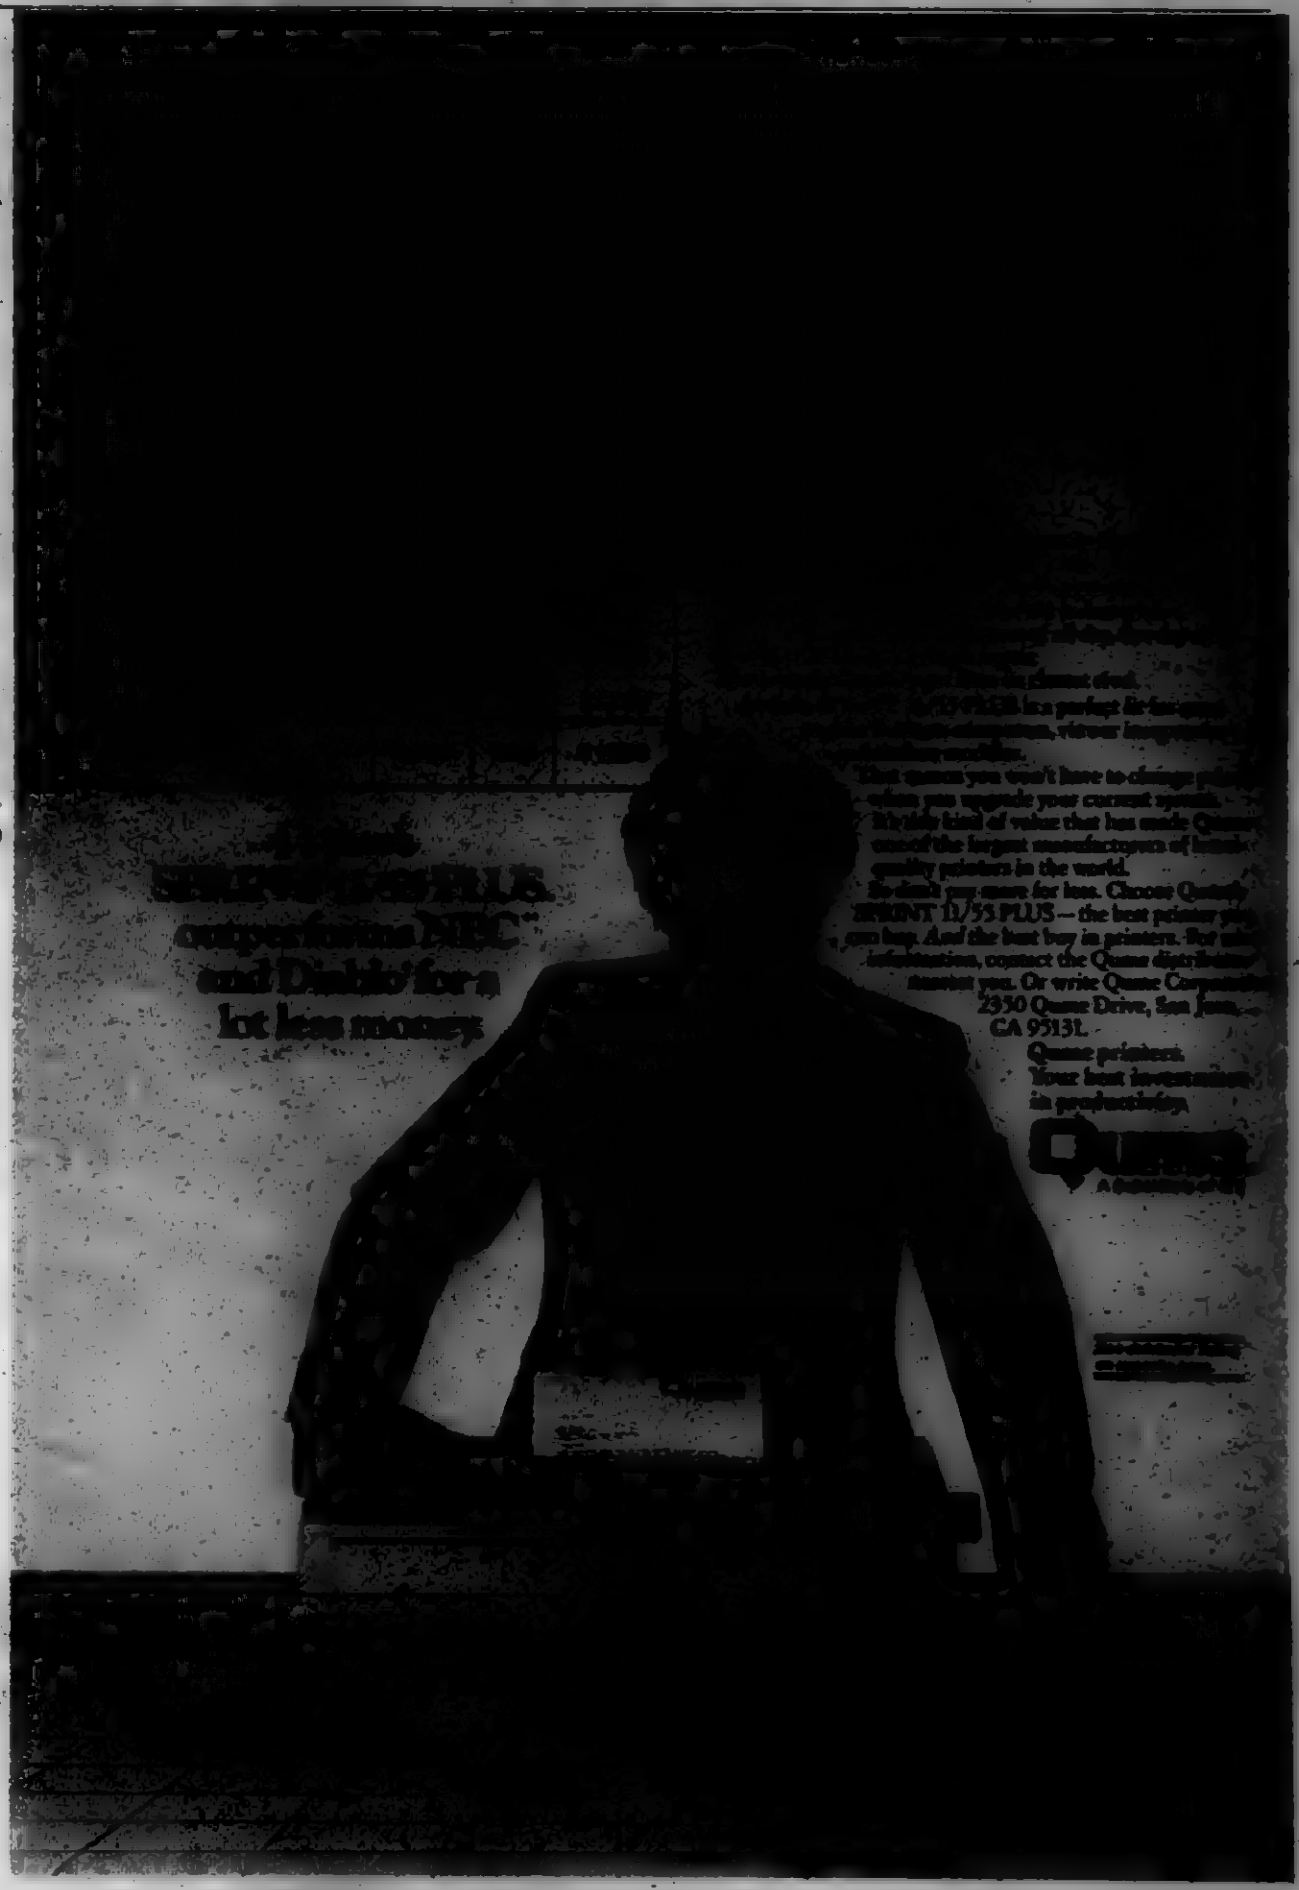
Qume. A Subsidiary of ITT



SUPERSHORTS

Bell Atlantic will market and service **Proteon, Inc.'s** local-area network, Pronet, through its new subsidiary, **Bell Atlanticom.** Bell Atlantic, comprising seven former Bell operating companies in the mid-Atlantic region, serves 14 million customers.

■

Iomega Corp. has opened a new 24,000-sq.-ft. manufacturing facility, bringing the company's total facilities to 92,000 sq. ft. The expansion will enable Iomega to boost both head and drive production to over 300 units each per day.

■

Xerox Corp. has signed a five-year lease for more than 23,000 sq. ft. of product showroom and demonstration space at Infomart, the Dallas Mart Center's International Information Processing Market Center, scheduled to open in Nov. 1984.

■

VLSI Technology, Inc. (VTI) and **Visic, Inc.** are participating in a joint venture to enhance VTI's design software and to develop process technologies using VTI's wafer fabrication facility. Visic will concentrate primarily on the product design and market development of high performance random-access memory circuits.

■

Harris Corp. has presented Purdue University with a Harris 800 superminicomputer. The gift augments the campus engineering computing network.

■

Prime Computer, Inc. and **Frey Associates, Inc.** have reached an agreement to hold the Themis trademark jointly. Lawsuits initiated by Prime in Nov. 1983 over the trademark have been dropped. Under the agreement, Frey Associates, which markets a natural language query software package, will refer to its Themis product as a Management Information System, while Prime will call their Themis product a Logic Simulator.

■

Dataquest, Inc. has expanded its coverage of the Japanese semiconductor industry to include the rapidly expanding Asian markets. Dataquest's Japanese Semiconductor Industry Service now covers Korea, Hong Kong, Taiwan, Singapore and Southeast Asia in addition to Japan.

■

The National Education Association Educational Computer Service has assessed, certified and recommended Control Data Corp.'s Plato educational courses to its 1.7 million members.

Tandon consolidates divisions, eliminates jobs

CHATSWORTH, Calif. — Tandon Corp. announced recently it is consolidating two of its five Southern California divisions and eliminating 1,000 jobs in a move toward greater reliance on off-shore production of its disk drives.

"Because of increasing price competition from our competitors manufacturing off-shore, we are being forced to rely on our production capabilities in Singapore and India more than we originally intended," company President Sirjang Lal Tandon said.

Tandon said the company will attempt to maintain as much production as possible at its California facilities, but that lower cost production is "unavoidable if we are to meet the price demands of the marketplace."

Another reported factor influencing the move to greater dependence on foreign production was that an increasing number of Tandon's customers "are involved in off-shore production and require direct delivery to their plants in the Far East and Europe."

The consolidation will reduce Tandon's U.S. work force from 2,575 to about 1,575. Tandon last month had eliminated 400 jobs in a move it said was primarily to eliminate duplicated jobs among domestic operations.

COMPUTER INDUSTRY

MERGERS AND ACQUISITIONS

Syntech International, Inc., Dallas, has reached an agreement in principle to acquire **Octagon Computer Systems, Inc.** of San Jose, Calif., for common stock, which has a current market value of approximately $1.8 million, in addition to certain earn-out provisions.

■

Banctec, Inc., Dallas, has announced a definitive agreement to acquire **Scan Data Corp.** and the **Reader/Sorter Division of Control Data Corp.** Banctec will issue 311,000 shares of its common stock for all outstanding Scan Data common stock and 300,000 shares of Banctec common stock for all the outstanding preferred stock of Scan Data.

First Software Corp., based in North Andover, Mass., has discontinued merger negotiations with **PC Telemart, Inc.** According to Ken Carpenter, chairman of First Software, further investigations indicated a merger would not have been in the best interest of First Software.

■

Cognitronics Corp., Stamford, Conn., and **American Computer Corp.**, San Diego, have announced that they have merged. Also announced was the acquisition of the net assets and business of American Computer software affiliate **Administrative Systems, Inc.** by Cognitronics. The initial purchase price is $1.2 million, payable in cash and stock with a potential maximum purchase price of $10 million, depending on substantial future growth in revenues and earnings over a three-year period.

Perkin-Elmer Corp., Norwalk, Conn., has announced that it intends to acquire the **Qualitron Corp.**, Danbury, Conn. Qualitron manufactures masks for producing semiconductor devices, as well as multilevel printed-circuit boards.

■

Computervision Corp., Bedford, Mass., has announced the acquisition of the **Organization for Industrial Research**, Waltham, Mass., a supplier of group technology and process planning software for computer-aided design and manufacturing.

■

Hewlett-Packard Co. and **Xonics, Inc.** have signed a letter of intent for HP's acquisition of the assets of Xonic's Ekoline Division for an undisclosed amount of cash. Ekoline, based in Sunnyvale, Calif., manufactures medical equipment that produces images of body structures through the use of high-frequency sound waves.

■

Data I/O Corp. of Redmond, Wash., recently announced it has entered into an agreement in principle to acquire **Callan Data Systems, Inc.** of Westlake Village, Calif., in exchange for 1.7 million to two million shares of Data I/O common stock. Callan Data manufactures the Unistar workstation using Unix and the Motorola, Inc. 68000.

IPL from page 109

sions in anticipation of an IBM announcement of a new line of mid-range computers and a general slowing of shipments as the current generation of mid-range computers "enter the later stages of their life cycle."

IPL said initial shipments of its Model 4480 are expected to take place in the first half of 1984.

NEW LIFE FOR *1401* PROGRAMS

CS-TRAN converts your 1401 object programs to COBOL for the mainframe or mini of your choice.

CS-TRAN is the only translator that accepts your object programs, patches and all, yet allows you to include actual COBOL paragraph names and record definitions.

If you'd like more details about new life for your 1401 programs just call or write Russ Sandberg.

NICKELS AND DIMES

Visual Technology, Inc. has reported earnings for fiscal 1983 of $47.3 million, or 87 cents per share, up from $25.8 million, or 78 cents per share, over fiscal 1982.

■

Teradyne, Inc. has announced sales of $251.4 million and net income of $21.3 million, or 39 cents per share, for the year ended Dec. 1983.

■

Compucorp has reported a loss of $1.08 per share on sales of 38.2 million for the year ended Dec. 1983. This compares with earnings of 49 cents per share on sales of $35.2 million for the year ended Dec. 1982.

■

Floating Point Systems, Inc. has reported sales of $25.6 million for the quarter ended Jan. 31, 1984, an increase of 19% over the same period last year. Net earnings increased 48% to $3.2 million or 37 cents per share, compared with $2.2 million, or 25 cents per share, for 1983.

■

Wyly Corp. has announced 1983's fourth-quarter income increased to $1.2 million, or 7 cents per share, from $400,000, or 3 cents per share, over the same period last year.

■

Zenith Radio Corp. has reported earnings for 1983 of $46.3 million or $2.11 per share, compared to $24.3 million or $1.28 per share for 1982.

■

Integrated Software Systems Corp. has announced revenues for the year ended Dec. 1983 of $24.1 million, up 45% from revenues of $16.6 million for 1982. Net income rose 72% to $3 million for the year.

■

Western Union has reported a net loss for 1983 of $59.1 million, or $2.78 per share. These results compare with 1982 income of $85.8 million or $3.50 per share.

■

Dynax Corp. has announced net income of $2 million or 12 cents per share, including a net gain of $1.4 million or 8 cents per share for the first quarter ended Feb. 1984. Net sales for the quarter were $52.1 million, compared with $33.1 million for the first quarter 1983.

■

Nixdorf Computer AG, Paderborn, W. Germany, announced it will offer 20% of its share capital in the form of preferred stock in the late spring. The price of shares will be set on the placement date.

■

Datapoint Corp. has announced revenues for the second fiscal quarter ended Jan 31 of $140.8 million, compared with $134.2 a year ago. Net earnings increased to $9.2 million or 45 cents per share, from $1.8 million or 9 cents per share, for 1983.

■

Rolm Corp. has announced a tender offer for 3 million shares at a price of $41 per share. The proration period and right to withdraw tendered shares would be on March 6, and the offer would expire March 13.

■

Computer & Communications Technology Corp. has announced that revenues for fiscal 1983 were $83.5 million compared to $74.7 million for 1982. Fourth-quarter revenues were $20.9 million, compared to $16 million for the same period in 1982. A net loss of $24.6 million, or $3.21 per share, was incurred for the year, while a loss of $27.3 million, or $3.56 per share, was reported for the fourth quarter.

■

CGA Computer Associates, Inc. reported that revenues for the nine months ended Jan. 29, 1984 rose 38% to $32.6 million, while three month revenues rose 35% to $11.7 million. Net income for three months rose to $1.04 million or 29 cents per share, a 20% increase. For nine months net income rose $2.6 million, or 71 cents per share, from $2.08 million or 59 cents per share.

■

Comnet has announced that for the year ended Dec. 1983, revenues increased $440.4 million, a 7.5% increase over fiscal 1982.

■

AGS Computers, Inc. has reported revenues of $145.9 million and earnings of $5.7 million, $1.25 per share, for fiscal 1983.

Fill in your IBM micro/mainframe communications picture.

AST Research, the leader in IBM PC enhancement products, brightens your micro/mainframe communications picture with a full palette of economical, integrated hardware/software masterpieces. With AST Products, you can emulate IBM terminals or create PC-based Local Area Networks.

AST improves your office operating cost picture.

AST communications products give your IBM PC the flexibility to act as a terminal for your host system or as a stand-alone computer for smaller tasks. Your PC won't bog down the mainframe with unnecessary small jobs and local computing on the PC eliminates phone line charges too. Get the power of a mainframe when you need it and personal computer convenience right at your fingertips.

Applications solutions that are shrines of genius.

AST keeps pace with your ever-changing applications requirements with reliable, high quality, cost effective communications products. AST products provide support for Bisync and SNA/SDLC communications protocols as well as networking multiple PCs for sharing resources.

Choose AST products — by the numbers.

These AST communications packages are currently available:

1. AST-SNA™ emulates a 3274/3276 controller and 3278 or 3279 display terminal using SDLC protocol.
2. AST-BSC™ emulates 2770 batch RJE and remote 3270 display terminals using 3270 Bisync protocol.
3. AST-PCOX™ allows your PC to connect to an IBM 3274/3276 cluster controller via coax cable and emulates a 3278 or 3279 display terminal.
4. AST-3780™ emulates 2770, 3780, 3741, and 3780 RJE workstations using Bisync protocol.
5. AST-5251™ emulates a 5251 Model 12 remote workstation connected to an IBM System 34, 36 or 38.
6. PCnet™ is the first Local Area Network designed specifically for the IBM PC or XT and the PC-DOS 1.1 or 2.0 operating system.
7. CC-232™ is a user-programmable dual-port card capable of communicating in Async, Bisync, SDLC, or HDLC protocols.

Discover how well AST can fill in your micro/mainframe communications picture. For descriptive data sheets, write or call: AST Research Inc., 2121 Alton Ave., Irvine, CA 92714. (714) 863-1333. TWX: 3106708378

Roswell C. Miller has been appointed vice-president, systems marketing, at U.S. Satellite Systems, Inc.

■

Jay Laveje has been appointed vice-president, systems integration, at Martin Marietta Data Systems, a division of Martin Marietta Corp.

■

R. Patrick Forster, a Litton Industries vice-president, has been appointed president of the company's Itek Graphic and Compositions Systems Division.

■

Gary E. Anderson has been elected president and chief operating officer of Execucom Systems Corp.

■

Roland Boisvert has been appointed vice-president of marketing at Computer Services Corp.

■

Pat Richard has been appointed vice-president of product development at Paradyne Corp., reporting directly to Kenneth Wall, senior vice-president, operations. Richard joins Paradyne with over 18 years of product development experience with IBM and was most recently vice-president of development for NBI, Inc.

■

Dominick A. Intartaglia has been elected vice-president, business development, for RCA Global Communications, Inc.

■

Harold L. Brownman, president of Lockheed Electronics and executive vice-president of the Lockheed Corp., has joined the board of directors at Verdix Corp.

■

Jon E. Carnell has been elected senior vice-president, semiconductor sector, at Harris Corp.

■

Graham R. Briggs has been named vice-president of finance at Charles River Data Systems, Inc.

■

James G. Moore has been appointed vice-president of systems programming and **Frederick G. Roberts** has been named vice-president of marketing at Microcomputer Graphics, Inc.

MEET DATAPORT.™

THE VITAL CONNECTION IN YOUR INFORMATION CENTER.

Imagine the potential of an Information Center tool that lets even the most novice of users work with data and send it back and forth among leading micro and mainframe products.

STSC's DATAPORT product is that tool. With this versatile display and analysis product in your Information Center, there is virtually no piece of data beyond reach. DATAPORT's interfaces connect you to popular products like FOCUS®, RAMIS®, IFPS®, SAS®, ADRS-II, APL/DI, VisiCalc®, and LOTUS's 1-2-3™.

To top it off, DATAPORT is a stand-alone, full-screen entry, display, and analysis system. Its file-folder concept allows users to work with tabular data like budgets or sales forecasts and text data like memos, instructions, or reports. The DATAPORT product also provides powerful calculation routines, highlighting, report formatting, and even works with multi-dimensional data.

Most important, DATAPORT was designed from the very beginning for the wide range of users in the Information Center environment. A unique combination of menu and command-driven technology provides a level of friendliness that satisfies the needs of both expert and novice users.

See for yourself how the DATAPORT product can be the vital link in your Information Center. For a free demonstration, write or call Margaret Tanzosh, STSC, Inc., 2115 East Jefferson Street, Rockville, Maryland 20852. (301)984-5000.

Gale C. Morgan has been appointed manager of the artificial intelligence marketing group at Digital Equipment Corp.

■

Jack M. Kleber has been named president of GTE Communications Products.

■

Peter F. Pellegrino has been promoted to corporate vice-president of office products marketing for Compucorp, Inc.

■

George C. Kenney has been named vice-president of Sony Corp.'s Information Products Division.

■

Charles M. Bacher has been appointed president of Emulex-Caribe, Emulex Corp.'s manufacturing subsidiary in Dorado, Puerto Rico.

■

Stephen M.D. Day has been elected vice-president, corporate development, of Communications Satellite Corp.

■

D.W. McArthur has been named vice-chairman of the Computer and Business Equipment Manufacturers Association.

■

Howard L. Nevin has been appointed vice-president, product planning and corporate development, at Verdix Corp.

■

AT&T Technologies, Inc. has announced the election of four vice-presidents. They are **Marilyn Laurie**, public relations and public affairs; **Paul M. Eslow**, assistant general counsel; **David M. Mitchell**, financial management and control; and **Robert L. Shaughnessy**, human resources and labor relations.

■

Paul E. DeLaney has been promoted to vice-president of manufacturing operations for Honeywell, Inc.'s Office Management Systems Division in Billerica, Mass.

■

Ivan Secher, former president and chief executive officer of Andax Corp. (now a subsidiary of Ungermann-Bass, Inc.), has joined Fibronics International. He will spearhead the introduction of Fibronics' "coaxial doubler" in North America.

■

William J. McCreary has been appointed vice-president, program development, of Computer Science Corp.'s Systems Group.

■

Jean-Paul Gagnon has been appointed vice-president, commercial sales, Integrated Office Systems, and **Thomas R. Worthy** has been named executive vice-president, marketing, at Northern Telecom, Inc.

■

Robert K. Reid has been appointed vice-president of product marketing at NBI, Inc.

■

Gregory J. Liemandt, chairman and chief executive officer of Wyly Corp., has assumed the responsibilities of chief operating officer in a restructuring of the company's senior management organization. **Paul E. Newton** has been appointed senior vice-president of University Computing Co., a Wyly subsidiary.

INTRODUCING YOUR NEW NIGHT SHIFT.

BISYNC communication for DEC Rainbow,® SIRIUS/Victor®, Hyperion® and most MSDOS® computers. Available now at list prices starting at $450.

BiComM-3700 lets your personal computer communicate with a mainframe even when you're asleep. Telephone costs are lower. Mainframe time is cheaper. And how many people are anxious to use your computer at 2:00 AM?

REMOTE JOB ENTRY

The BiComM-3700 communications package emulates the popular 2780/3780 series of RJE stations, with many added features. You can prepare a simple command file to direct it's operation when no one is around. Of course, you can also transfer files in an interactive, menu-driven mode day or night.

BEST ASSURED

You'll be able to sleep soundly because BiComM-3700 uses the BISYNC communications protocol—tried, tested and proven effective for over fifteen years. It contains powerful error detection features to insure that your data arrives safely and securely, writing a complete time-stamped record of everything it does.

FAST—FAST—FAST

Your new night shift works faster than others because it can communicate at speeds up to 19,200 baud, and up to 9600 baud over dial-up, voice grade telephone lines using standard modems. That means no extra costs are incurred for specially treated lines. When you arrive the next morning you'll already have a big head start on the day's activities.

BiComM-3700

Put your night shift to work for you tonight!

BANKRUPT from page 90

said they needed, we had to provide."

Wright defended the contracts: "These contracts worked well with some users, and we quickly developed their system. But others were, in my opinion, not reasonable. We spent a great deal of time customizing their system and not making as much money as we hoped because costs were fixed."

Some employees thought the company needed a standard product that it could tailor to each user. Jack Donovan, former marketing director, noted, "Lack of a standard product was critical in the company's demise." Wright said a standard package was under development, based on experiences with earlier users, but the company ran out of funding.

Another problem surfaced because the company hitched its star to Wicat Systems, Inc.'s System 150 microcompute s, but insurance companies were looking for systems that used IBM microcomputers. "A number of companies said they were interested in the product," Donovan said. "But they wanted us to come back when the software ran on the IBM Personal Computer." Last month, the company began testing a pilot version of the product that ran on an IBM microcomputer.

Compounding these problems was the company's explosive growth from three people at incorporation to 75 employees in June 1983. Signs of fiscal problems surfaced last summer when quarterly bonuses were promised, but not given to employees. "The company should have realized sooner that it needed additional capital," Donovan said.

According to Wright, the company tried to do too much. "As we customized each package, upgraded the software, tailored the software to the IBM Personal Computer and developed a standard product, debts grew. In hindsight, maybe we should have tried to grow more slowly and do a little bit less."

As of now, the fate of the company's users and assets is uncertain. While a Chapter 11 filing brings a reorganization, a Chapter 7 filing requires a complete liquidation. "The company needed a financial backer to file a Chapter 11, but it didn't have one," according to one former employee.

Wright hopes to form a support company for current users. "The technology is just too powerful to let slip away," he said.

IF YOU'RE NOT IN COMPUTERWORLD'S NEXT THREE SPECIAL REPORTS, LOOK AT THE ISSUES YOU'LL BE MISSING.

Computerworld's special report issues are ideal both for the advertiser and the reader. Because each one offers focused, in-depth information.

Readers always want to catch up on what's hot and what's not in their particular specialty. And find out what the vendors have to offer.

As an advertiser, you won't want to miss the opportunity to tell them.

Maybe that's why our special reports are so popular.

Everyone wins.

AT&T seen leading off with superminis

NEW YORK — AT&T's coming out party is just around the corner and will be signaled by the introduction of the company's first commercially available computers, according to Stephen P. Cohen, vice-president and director of The Gartner Group's Industry Service.

The first processors AT&T will market will be the 3B20 and 3B5, superminicomputers that have been available to Bell system companies for some time, Cohen said.

Follow-up products will likely be smaller versions of the 3B5. These will include the 3B2-400 and 3B2-300 minicomputers that will range in price from $50,000 to $75,000 and provide departmental computing power, Cohen said.

He also predicted that AT&T will introduce a multiuser personal computer that will be priced in the $15,000 range.

High-end AT&T personal computer products will likely include the 3B2-200 and 3B2-100, $5,000 to $15,000 systems that support Unix and perhaps Microsoft, Inc.'s MS-DOS as a guest operating system.

To compete in the personal computer market typified by the IBM Personal Computer and Personal Computer XT, Cohen hypothesized, AT&T will rely on products from Convergent Technologies, Inc. and from Olivetti Corp.

Cohen expects all of these products to be introduced between now and the first quarter of 1985. Because equipment will initially come from many sources, he said, the company's early products may lack integration and may even occasionally compete against each other.

WILL THE AT&T BREAKUP MEAN AN MIS SHAKEUP?

You'll know, when you view
"DIVESTITURE: IMPACT ON INFORMATION MANAGEMENT"
Exclusively from
DELTAK's Special Edition:
Computerworld Reports.

The AT&T divestiture is undoubtedly the most earth-shaking event in recent business history. The repercussions will be felt throughout the telecommunications industry for many years to come. It will also profoundly change the way your company processes all forms of information. That's why you owe it to yourself to watch "Divestiture: Impact on Information Management," an up-to-the-minute half-hour video cassette report presented by DELTAK and CW Communications.

This month, you'll enjoy the invaluable insights of a respected communications consultant, and a major communications vendor whose company may benefit from the recent breakup. Your program host is John Gantz, noted MIS author and contributing editor of INFOWORLD magazine.

And be sure to keep watching, because more hard-hitting issues of Computerworld Reports such as DP/Office Automation Integration and The Maturing Information Center will be coming in the months ahead. Or, previously released Reports addressing major issues are still available including: The MicroMainframe Link, Integrated Microcomputer Software and Managing the Communication Network.

Remember, before the Big Breakup shakes your information system up, order "Divestiture: Impact on Information Management." Call DELTAK order entry at (312) 369-3000; (416) 678-9222 in Canada.

AT&T from page 99

he said, include the lingering effects of reorganization, which carries with it the necessity to breed a new corporate culture fired by competition. Perhaps even more importantly, Cohen pointed out, is that AT&T has to cultivate relationships with new sales contacts, particularly among MIS managers.

Other than further development of its Net 1000 service and its continuing efforts to sell the System 85 digital private branch exchange, Cohen predicted AT&T's adding emphasis on the marketing of its Unix operating system and the commercial introduction of a family of processors, ranging from superminicomputers to single-user personal computers, would also aid in its bid.

IBM, on the other hand, needs to beef up its communications equipment and service offerings to be a complete information industry supplier.

Richard E. Impraheim, corporate vice-president of research at Gartner, said that IBM won't wait until AT&T brings the battle to it, but will "investigate and/or enter all segments of the communications business except those that are rate-of-return regulated or union dominated." He does see, however, IBM entering rate-of-return regulated markets where strategic.

Imershein noted that while he anticipates IBM's "confrontation with AT&T in communications will be secondary to the battle in office systems," IBM will expand certain communications pieces already in place.

He speculated that IBM will build on and improve its Systems Network Architecture, beef up the Information Network and even try to acquire another third ownership share of Satellite Business Systems (SBS) by buying out Aetna Life & Casualty Co.

Imershein believes SBS losses will continue, but noted that IBM forecasts a big demand for private and semiprivate data communications networks in the late 1980s.

FUJITSU from page 99

technical resources — far more of that, including semiconductors, than any other non-IBM company."

If you have any doubts about just who calls the shots at Amdahl, just ask the man who founded the company and had to leave his name behind.

Gene Amdahl, who left Amdahl Corp. and now heads Trilogy Ltd., said in a recent interview that Fujitsu always has managed to protect its interests.

When Fujitsu representatives perceived their company had an interest in an Amdahl Corp. manufacturing area, they always made sure those interests were protected, according to Amdahl.

The acquisition "actually may be more helpful to Amdahl, [which] may be able to use more advanced technology," he said. On the flip side, it may just increase the perception that Amdahl Corp. is under the control of the Japanese, "but not any more than it always has been."

If Fujitsu actually does turn Amdahl Corp.'s marketing, distribution and servicing organization to its own use, it just may have the products and the financial stability to keep a healthy dose of free enterprise in the U.S. computer industry.

POSITION ANNOUNCEMENTS

Valley National Bank, the largest bank in Arizona, has openings for the following positions:

V.M. Systems Programmer
Systems Software Specialist II or Senior who will install, test and implement V.M. operating systems releases. Position requires 2 yrs. experience as a V.M. Systems Programmer, installing V.M. operating systems and program products. This position will involve user interface and assistance, with other bank departments.

Tandem Programmers
To provide program development for project activities and maintenance support on the following systems: on-line investment systems, multiphase home banking project, on-line ATM's systems and point-of-sale project. Positions require programming experience using COBOL, TAL and PATHWAY on Tandem equipment with IBM support. Significant user interface and systems analysis experience is desirable.

Please send Resume in confidence to:

MIAMI-DADE COMMUNITY COLLEGE - South Campus
SYSTEMS PROGRAMMER

Vital systems programming/analysis position to work closely with academic personnel to determine needs, write specifications, study market offerings/proposals, and recommend acquisition of suitable software/hardware solutions. REQUIRES: Bachelor's Degree in appropriate field and five years data processing experience with in-depth design knowledge. Two years experience as a Systems Software Programmer. At least two years experience in an appropriate field may be substituted for the degree requirement. Some experience as a systems programmer in an MVS installation. Knowledge of ROSCOE, and some DBMS understanding. Ability to coordinate solutions for a diverse user community essential. SALARY: $28,931 Minimum with Liberal Employee Benefits program. For further information, contact Al Le Duc at (305) 596-1357.

HARDWARE/ DATA COMMUNICATIONS COORDINATOR - South Campus

Directly responsible for preserving the operational integrity of all operations hardware and data communications equipment college-wide. Responsible for problem determination, solution and follow-up for all communications data circuits. REQUIRES: Bachelor's Degree in Electronics, Electrical Engineering or related field or equivalent combination or experience and training. Four years in-depth experience in data processing and/or electronic field engineering. Proven problem solving capability with computer hardware and data communications. Familiarity with medium/large scale computer hardware and data communications equipment and understanding of modems and telephone data protocol. SALARY: $22,968 Minimum with Liberal Employee Benefits program.

Submit two copies of resume, credentials and letters of reference to Personnel Services: 11011 SW 104 St., Miami, FL 33176.

AN EQUAL ACCESS/EQUAL OPPORTUNITY COMMUNITY COLLEGE

Join The Team That Created The Elegant NS16000

An elegant approach led to a very elegant solution — National's NS16000 microprocessor and its product family. The revolutionary top-down architecture delivers 32-bit power, and memory management capabilities on par with the latest mainframes. The upward-compatibility will accommodate a shift from 16- to 32-bit hardware. In essence, the NS16000 performs more like a computer than a chip, and we think that's a very elegant package.

A "Software-Intensive" Effort.

The NS16000 microprocessor is the spring-board for an entire family of products currently being developed at National's Microprocessor Systems Division. The key to their success lies in the development of software that enhances the NS16000 family's performance, applicability, and elegance. From development through marketing, our "software-intensive" effort is rapidly gaining momentum as we develop demand-paged UNIX™ systems based on Berkeley 4.1bsd and 4.2bsd for National's NS16032 and NS32032 microprocessors. We are also working with Bell Labs to define a version of SYSTEM V, . . . ,etc, for NS16032 and NS32032. These developments are creating opportunities for software professionals with UNIX and IBM PC™ experience to join us in the following areas:

Compiler Development

You will be involved in developing compiler code optimizers for "C", Pascal, FORTRAN, etc, to take advantage of the NS16000 elegant architecture. Your background should include two to five years' experience in compiler development; UNIX experience is desirable.

UNIX Kernel Development

You will work on porting Berkeley 4.2bsd to NS16032 and NS32032 based microcomputer systems (including a popular PC configuration with NS16032 and NS32032 add on boards). Two to five years' experience in UNIX kernel development is desired.

The Rewards Of Elegance.

The elegance and power of the NS16000 will become evident as more software is developed for it. And those who develop that software will reap the rewards, personally and professionally. That's definitely something to think about if you're ready to take on the challenge of our opportunities.

To learn more about National's Microprocessor Systems Division, send your resume to National Semiconductor, Dept. MS, P.O. Box 62499, Sunnyvale, CA 94088. We are an equal opportunity affirmative action employer. Principals only please.

NS16000
Elegance is everything.

[redacted] talk about your career.

Software Professionals!

Major Expension Opportunity!
We're Changing The Pace of Banking!!!

ISC Systems Corporation designs, manufactures and markets on-line terminal systems for financial institutions. We are seeking additional SOFTWARE PROFESSIONALS with assembler language experience. Our system utilizes a unique architecture incorporating a Z-80 microprocessor and a sophisticated multi-tasking operating system.

INSTALLATION SOFTWARE ENGINEERS

Our software engineers are responsible for coding and installation of our customized financial applications software. Customer interface is required. We have opportunities in the following cities:

Atlanta Dallas Orlando New York Metro Philadelphia Boston Glendale
Washington, D.C. Chicago Minneapolis Dayton Menlo Park

AND, in the Washington, D.C.-Philadelphia Area we have need for a:

SOFTWARE CENTER MANAGER

To qualify for this opportunity you should have the necessary software background mentioned above with 3+ years' managing a technical software group.

ALSO, in our Atlanta Regional Headquarters, we have an opportunity for a:

SOFTWARE CUSTOMER SUPPORT MANAGER

This position requires prior experience directing on-going software support combined with a strong technical background, preferably with microprocessor-based assembler. Strong customer relations skills and prior experience managing a small group of professionals is also required.

We offer competitive salaries including incentive bonuses, company paid benefits and flexible working hours. If you are qualified and interested contact our representative nearest the city you have an interest:

In Southern & Eastern States contact:
Mike Robertson
ISC Systems Corporation

JOIN THE SIMON TEAM!

If you are looking for a real challenge and exciting opportunity in your field, not to mention excellent medical, dental and retirement benefits, consider joining our team. We are one of the nation's leading shopping center development and management firms and rapid expansion in our Management Information Services area is providing some excellent opportunities. If you are an experienced MIS professional, your skills could be just what our company needs.

Specifically, we need to fill the following positions:

★

PROJECT LEADERS
(PRODUCTION SOFTWARE)
Experience in mainframe application systems. Must be able to lead development and implementation of on-line computer software. Management and proven development expertise necessary.

★

COBOL PROGRAMMERS/ANALYSTS
Experience in wide range of transaction-based application software. Applicants should have a good working knowledge of COBOL and data base management systems.

★

TECHNICAL WRITER
Recent promotions have left positions open for COBOL-knowledgeable writers. This is an entry level position.

★

PC PROGRAMMERS
Experienced basic PC Programmer with PC-DOS/MS-DOS experience. Must install and maintain packaged software in addition to development of in-house software.

If qualified, you will work in a dynamically growing state-of-the-art DEC 2060 environment migrating from PDP 11/70's using TOPS 20, COBOL, SCOPE, ACCENT R, and other software.

For immediate consideration, submit resume with salary history to:

High Technology CONSULTING

SEI's role and reputation continue to grow as one of the nation's leading project-oriented high technology consulting organizations. The skills of SEI Consultant Teams are in demand to specify and construct sophisticated systems and applications across the country.

New SEI projects include industrial automation, advanced microprocessor systems, state-of-the-art online and distributed systems, and support for the emerging cellular telephone industry. Now getting into full swing, these projects offer you an unparalleled opportunity to be a part of major application and internals efforts from the ground up.

SEI is looking for first rate professionals – leaders and technical experts – who are eager to learn, ready to work hard, serious about their careers, and interested in the variety and challenge of consulting.

Mainframe Systems

Application Developers
$31-$61K

Get in on the ground floor of new development for the communications industry and publications industry. These are major new systems: distributed, networked, online – some of the genuinely significant development projects of the 1980s.

Qualifications: Substantial solid, real-world development experience...Familiarity with large-scale IBM environments and software: OS/MVS, VM/CMS, CICS, IMS, VSAM....Working knowledge of Structured Analysis and Design...FOCUS experience a plus.

IBM System Internals Experts
$46-$78K

Construct and enhance development and production environments. Participate in custom tailoring, installation, troubleshooting, performance optimization, capacity/configuration analysis and planning for systems and communications.

Qualifications: Significant system programming experience...In-depth knowledge of mainstream IBM products including: CICS, IMS DB/DC, VM/CMS, OS/MVS, SNA/ACF/NCP/VTAM....Outstanding assembly language programming skills...Understanding of the interaction between systems and applications.

Micro-Products

Hardware Developers
$31-$61K

Participate in the development of new integrated consumer-oriented terminals for use in a distributed environment. Help explore, define, construct, and integrate workstations for CAD/CAM/CAE.

Qualifications: Well-balanced experience in microcomputer-based device specification and integration, especially 68000-based products...Demonstrated ability to develop good business solutions as well as good technical solutions.

Software Experts
$38-$78K

Participate in the development of large-scale leading-edge micro-based products and applications. Help establish development environments, port and tailor software, contribute to firmware and hardware development.

Qualifications: Outstanding successful experience in large-scale, micro-based software development...Working knowledge of micro-based operating systems, compilers, communications, I/O drivers, LANs, and software products...IBM-PC and PC-COBOL a plus.

Leadership and Support

Development Managers
$46-$78K

Lead and participate directly in the planning and construction of major mainframe and microcomputer development efforts. We're looking for hands-on, technically-oriented managers who lead from personal practical experience in building large-scale systems.

Qualifications: Wide-ranging, hard-nosed system analysis, design, and programming experience plus at least 2 years of significant technical project management...Familiarity with system development and project control methods...Strong IBM mainframe or micro-technology background.

Technical Writers
$31-$56K

At SEI, Technical Writers are contributing consultants, not just editors of other people's drafts. SEI technical writers participate in all aspects of investigation, analysis, design, development, and training, with a focus on quality assurance and the development of production documents.

Qualifications: Broad practical experience in programming, design, and analysis...Outstanding writing/editing skills...Exceptional good sense and broad perspective on EDP...College level teaching experience a plus.

OPPORTUNITY!

Positions are available at SEI's offices in Chicago, Los Angeles, New York, Phoenix, and San Francisco and at additional project sites in Tulsa, the Virginia Tidewater area, and Putnam County, New York. SEI offers top salaries, an imaginative personalized benefits package, unlimited opportunity for growth, and the challenge of working alongside other SEI consultants – the best in the business.

For confidential consideration, send detailed resume and salary history to:

NATIONAL BUREAU OF STANDARDS
INSTITUTE FOR COMPUTER SCIENCES AND TECHNOLOGY

OPPORTUNITIES FOR CHALLENGING POSITIONS IN COMPUTER SCIENCE AND TECHNOLOGY

Computer Scientists/Electrical Engineers

The Systems Components Division of the Institute for Computer Sciences and Technology of the National Bureau of Standards is seeking GS-12, 13, 14 and 15 Computer Scientists and Electrical Engineers to perform research and advanced development on multiprocessor computer systems, speech recognition, data encryption for computer security, and optical data storage using computer processing. Successful applicants must possess an in-depth knowledge and familiarity with one or more of the following technological areas:

MULTIPROCESSING COMPUTER SYSTEMS

Theoretical and applied computer science and technology with emphasis on computer architecture, multiprocessing systems, or parallel processing.

SPEECH RECOGNITION

Theoretical and applied pattern recognition technology with emphasis on acoustics, phonetics, and artificial intelligence algorithms and languages.

DATA ENCRYPTION FOR COMPUTER SECURITY

Theoretical and applied computer science, data communications, mathematics, cryptographic algorithms, and computer security analysis problem definition.

OPTICAL DIGITAL DATA RECORDING SECURITY MECHANISMS

Theoretical and applied optical and magnetic technology with emphasis on computer mass storage, system architecture, or dynamic test and measurement techniques.

These positions range from the GS-12 to GS-15 grade levels depending upon qualifications and experience and offer competitive salary, excellent senior benefits and professional growth opportunities. Please send your Personal Qualifications Statement (SF-171) to:

U.S. Department of Commerce
National Bureau of Standards
Administration Building, Room A-169
Washington, D.C. 20234

Attn: Ms. Josephine White (C2307)

The National Bureau of Standards is located in modern facilities in Gaithersburg, Maryland and is an EQUAL EMPLOYMENT OPPORTUNITY/AFFIRMATIVE ACTION Employer. U.S. Citizenship is required.

Pacific Northwest

Telecommunications Analyst/ Programmer

Series/1
Communications Expertise

Westin Hotels, a major international hotel corporation, has an exciting opportunity for a motivated individual as a Senior Telecommunications Analyst/Programmer based in Seattle, center of the Pacific Northwest. The individual will support our 30+ Series/1 installations situated throughout the world. Up to 30% travel is required.

The responsibilities of this individual include the development of new software for a wide variety of telecommunications and interface equipment, the installation of hardware/software systems, worldwide support of the installed system base, and vendor liaisoning.

To qualify you should have a degree in Computer Science or Mathematics and a minimum of two years Series/1 EDL and CF experience. Excellent written and verbal skills are essential. You should have a track record of quality software development, have had exposure to communication protocols (ASYNC, BSY/HC, SNA/SDLC, X.25), be able to work under minimal supervision and accept the challenge of working with computer and communications hardware.

Join us in Seattle and become a part of a dynamic team! Even if you are the adventurous individual we are looking for this unique opportunity, you are invited to send your resume and salary requirements to: Peter Hurlburt, Westin Hotels, The Westin Building, Seattle, WA 98121. Or call Peter Hurlburt at (206) 447-4626. We offer a competitive compensation and benefits package. Relocation assistance provided.

Hardware and Software Professionals

Make a move to Rochester, Minnesota for an IBM career...

in small and intermediate systems and DASD development and manufacturing.

We are interested in Hardware and Software professionals who stand out clearly in a field noted for outstanding talents.

If your interest is in advanced, small and intermediate systems, explore the opportunities in this innovative and exciting environment.

Products that have been developed/manufactured here include the System 34, System 36, the new System 38, associated terminals and direct access storage devices, all using new technologies and new ideas to create pacesetting systems.

This continuing success has created a variety of openings. If you have a BS in EE, CS or related disciplines (or equivalent experience), we'll welcome your inquiry.

Positions are available in developing, testing, and manufacturing of systems and related I/O equipment:

Electrical Engineering
- System and I/O Architecture
- CPU Logic and Microcode
- LSI, Chip, and Module Design
- Digital Servo Systems
- Analog/Digital Circuits and Logic
- Test Equipment
- Computer Power Systems/Supplies

Systems Programming
- Systems Architecture
- Operating Systems
- Communications
- RAS, System Test, Performance Analysis, Simulation, and Verification
- Development Tools and Operations Support

All positions require U.S. citizenship or permanent residence visa.

Rochester, 80 miles southeast of Minneapolis, is within easy weekending in the northern lake districts of Minnesota and Wisconsin. There are multiple opportunities for sports, cultural activities, city or country living, and on-site advanced degrees in Engineering and Computer Science through the University of Minnesota. Other advantages are IBM's comprehensive company-paid benefits including tuition refund, medical and dental plans, and relocation assistance.

Please send confidential resume to:
Professional Recruiting Manager,
IBM Corporation, Systems Products Division,
Dept. 924 PP, 3605 Highway 52 No.,
Rochester, MN 55901.

Candle

DIRECTOR OF INTERNATIONAL OPERATIONS

BGS is the premier company in computer capacity management software. Our integrated family of products - BEST/1, CAPTURE, INFO/BASE, and CRYSTAL - is effectively serving the needs of over 600 large IBM facilities, worldwide. Demand for our software has been exceptional and is expected to increase considerably for both existing and to-be-released products.

Our expanding international activities consist of a London based subsidiary and distributorships throughout Europe, Australia and, imminently, the Orient and South America. Home office supporting groups include logistics, marketing and technical support personnel. The successful candidate for this newly created position will have full responsibility for these activities, including Marketing, Sales, Technical Support, and Administration, and will be capable of accomodating the extensive growth we anticipate. The position is based in Waltham, MA, and will require extensive travel.

Ideally, candidates will have had considerable and successful experience in Marketing and Management, on an international level. Preferably, such experience should have involved software or other computer-related products and/or services. Compensation will include, minimally, a generous base salary as well as an open-ended incentive arrangement.

Interested parties should forward their resumes to Ms. Charlotte Mist, prior to April 2, 1984.

DEC SYSTEMS ENGINEER

Orlando, Florida

At Systeme, our reputation for financial systems excellence isn't just being built... it's being earned.

In just 4 short but remarkable years, Systeme is becoming known as perhaps the most innovative manufacturer of financial hardware and software ever. Initiating breakthroughs and making the kind of advances that are propelling us further in today's leading edge technology.

Your background in financial/banking applications and current exposure to an on-line real time multi-tasking environment will be utilized in developing specifications, setting installation schedules and ensuring that customer systems become operational.

To qualify, you must have 3-5 years experience on DEC PDP 11 with RSX 11M+, working knowledge of Assembly language and related exposure to on-line terminal systems utilizing minicomputers with both up and down-line communications. Extensive interfacing with non-technical customer personnel also necessitates excellent interpersonal and communications skills and previous customer relations experience. Position involves frequent travel.

As a member of the Systeme team, you'll enjoy an excellent salary, comprehensive benefits, and the kind of career potential that can only be found in a vital growing organization. For immediate consideration, please send your resume in confidence to: Personnel Manager, Dept. CW-310

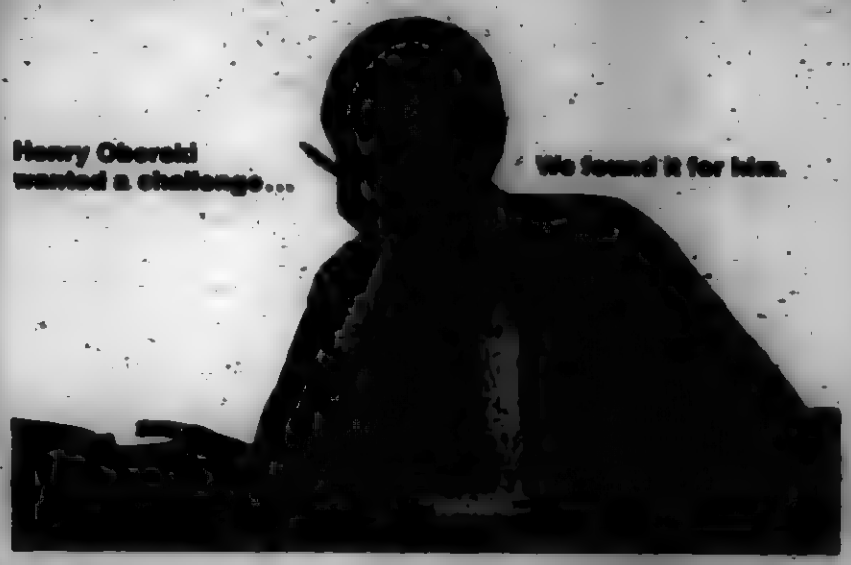
POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS



Henry Oberoi had been in the data processing field for a number of years before he first came to us. His education was most impressive. His EDP experience was extensive, to say the least. The problem was that, over the years, Henry had provided solutions to dozens of various challenges. He was, as a result, becoming bored with his work.

Henry was quite specific about what he wanted to do and that, indeed, became a real challenge to us. We had nothing immediately available to meet his requirements. So, we made a tremendous number of client contacts and, in time, we found a challenge that was the peak in Henry's professional life. Now he's happy and we're happy for him.

So, you see, NCA is not limited to routine placement services. Career advancement... we do it all... and no one does it better. Come in. Call. Or mail your resume to the NCA firm nearest to you. Confidentiality is assured. Company clients assume our fees.

Outstanding SENIOR MIS Opportunities

San Francisco Bay Area

COOPER LASERSONICS, one of the largest laser manufacturers in the world — and still growing — has recently expanded into a beautiful new facility and is also expanding its MIS staff!

SYSTEMS MANAGER

Design, program and maintain specialized systems software used to support all our computer operations and controls. Utilize your technical expertise in machine "internals" to correct system failures and to maximize our level of service to internal users. You will also design, write, test and document business application programs. To qualify, you must have a BSCS (or equivalent) and 2+ years systems programming experience on the HP 3000; ASK experience a plus.

SR. SYSTEMS ANALYST

Here is an opportunity to perform analysis and problem-solving for manufacturing applications software, to interface with users to evaluate requirements, and to define procedures and prepare documentation. Requirements include a BSCS degree and at least 2 years experience on the HP-3000. ASK systems analysis experience a MUST.

At COOPER LASERSONICS, we offer competitive salaries and a generous company-paid benefits package including medical, dental and life insurance. Please send resume with salary history to COOPER LASERSONICS, INC., 3420 Central Expressway, Santa Clara, CA 95051. (Refer to Box#CW319). An equal opportunity employer m/f/h.

Cooper

Cooper LaserSonics, Inc.

Director of Computer Services

Indiana University at Kokomo is seeking a Director of Computer Services to administer the computing of the administrative and academic data processing systems. The new unit has access to a Cyber 830, two DEC 11/70s, an IBM 4341, an IBM 3081, and four VAX 11/780s through the Indiana University Computer Network. Computer Services provides administrative data using Indiana University supported packages and locally developed programs and assists the faculty in the use of computers in research and teaching.

Applicants should possess a master's degree and both computing and administrative experience. Salary range is competitive with comparable college positions. The successful candidate is expected to assume his/her duties no later than Sept. 1, 1984.

Indiana University at Kokomo is one of the six regional campuses of Indiana University and is located 60 miles north of Indianapolis. Its mission is to meet the educational needs of north central Indiana through a broad spectrum of associate and baccalaureate degrees, and a limited range of graduate courses.

Applicants should send a complete curriculum vitae and the names, addresses, and telephone numbers of three references to:

Dr. Philip S. Hultsky, Chairperson
Director of Computer Services
Search and Screen Committee
Indiana University at Kokomo
2300 S. Washington St.
Kokomo, IN 46902

This search will continue until the position is filled, but applications received by April 1, 1984, are assured of consideration.

Indiana University at Kokomo is an EO/Affirmative Action employer.

We Serve Computer Professionals Exclusively
And That's Important To You!

Computer

The Pyramids Beckon You . . . (Cairo, Egypt)

As one of the world's largest information services companies, Computer Sciences Corporation has taken a solid leadership position in the development of technically advanced software systems.

At the Systems International Division of CSC, our continued growth has created an immediate requirement for an IBM OS/MVS Systems Programming Trainer, to be located in Cairo, Egypt, and mobilized within thirty to fourty-five days. The selected individual will be involved in the curriculum development and instruction of the following systems software courses: IBM Assembler Language, OS/VS facilities and VSAM, MVS software, TSO, SMP, RACF, and Data Communications.

Requirements include a BS degree, minimum of three years of experience as an IBM systems programmer with at least one year of MVS internals coupled with a minimum one year teaching ADP courses. A sound Middle Eastern acumen is considered highly desirable.

To learn more, please call/forward your resume immediately in confidence to Paul Gorey, Manager, Professional Staffing at (703) 471-3206/7.

An Equal Opportunity Employer

ABU DHABI - UNITED ARAB EMIRATES

Profile

Our client, a leading International Petrochemical Organisation, has commissioned the TASK FORCE Group to recruit a team of highly motivated Computer Professionals to form the basis of a rapidly expanding development department.

The exceptional opportunities being presented, provide a dynamic framework in which to contribute skills relating to database design and administration, systems and programming and computer operations.

The achievable earnings potential is significant. Our client offers an environment which is both pleasant to work in and has considerable prospects for career progression and development. The benefits package includes competitive tax free salaries, single or married status, air-conditioned accommodation to a high standard, air fares for employee and immediate family. In addition, the company extends financial assistance to dependants attending school up to completion of secondary education and also provides an interest free car loan to a maximum value of 36,000 Dirhams. All positions are permanent renewable on a 2 year basis.

The climate in the area is hot and humid in summer, temperate in autumn but moderate and pleasant during the rest of the year. Abu Dhabi is a modern city with good shopping, communications and recreational facilities. Primary and Secondary schools are available. Annual leave is 42 - 48 days dependant on seniority.

Our client operates an IBM 3090X series running under MVS/XP, CICS, TSO, VSAM, DL/1 or IDMS DB/DC, FORTRAN, COBOL and PL/1. Full job specifications and academic criteria are available for all positions advertised.

INFORMATION SYSTEMS CONSULTING

Our nationally prominent information systems consulting group is searching for a high-potential, achievement-oriented individual who wants to enter the consulting profession. We'll train and develop your consulting skills; you must bring excellent technical skills and an outstanding track record.

Here's a profile that we'd like you to have:

- Success at performing responsible line or staff jobs in a large scale information processing environment.
- A special area of technical or functional interest which you would like to further develop into true expertise.
- Current employment for 3 to 10 years since graduation with a well-managed large organization or vendor.
- Excellent academic preparation and a strong desire for continuing formal and informal education.
- Outstanding communication skills with a proven ability to persuade management through written analyses and effective presentations.

We have the ability and desire to help you grow at the fastest rate you can handle. Our existing clients are among the very best in their businesses, and they demand the best from us.

Write and let us know about you. We will treat your letter with total confidentiality and we'll acknowledge it even if we don't have a match. Address you letter to:

Deadline: April 2nd, 1994 5PM
Inquire: State Center Community College District, Personnel Commission, 1525 East Weldon, Fresno, CA 93704. Phone (209) 226-0758.

RESEARCH PROGRAMMERS

In the Computer Facility
In the Department of Computer Science
at the University of Illinois at Urbana-Champaign, Illinois

The positions require ability and experience in developing, maintaining, and documenting system software in a large computer system consisting of several medium-sized computers and associated equipment in an evolving research environment. The person will be expected to work with and interact with a large number of research faculty and group of graduate students. Ability to work with system vendors is required. Some knowledge of computer system hardware is required.

Minimum requirement is a bachelor's degree in computer science, computer engineering, or a related scientific field. Two years of relevant experience in software systems work is also necessary. Experience with UNIX system and the C programming language is required.

The position is academic year-renewal. The salary and rank are open, will be competitive, and will be appropriate to the qualifications and experience presented. The position is available immediately. It is hoped to fill the position by July 1, 1994 or earlier. In order to assure full consideration, application should be received by April 30, 1994. Interested persons should send a complete resume and three letters of reference to Jaideep M. Srivastava, Head, Department of Computer Science, University of Illinois at Urbana-Champaign, 1304 West Springfield Avenue, Urbana, Illinois 61801, phone: (217) 333-6788.

The University of Illinois is an Affirmative Action–Equal Opportunity Employer.

PROGRAMMER/ ANALYST

San Francisco Bay Area

Focus your professional expertise on Temescal, a high technology division of an international Fortune 200 Corporation, the BOC Group, Inc. In this position, we'll look to you for a key contribution as we enforce existing applications in our MAPICS software. To help meet the increased demand for our new products, you'll also design programs for production control and other functions to assure an efficient flow through manufacturing.

To qualify, 3-5 years programming experience is essential, including 1-3 years with IBM System 36 plus a degree or equivalent in Computer Science. Languages should include COBOL, RPG-III as well as MAPICS applications software in a manufacturing environment.

Temescal offers an excellent salary and outstanding fringe benefits including medical/dental/life insurance and a savings investment plan. Send resume in confidence to Temescal, Professional Selection, Dept. CW319, 2850 - 7th Street, Berkeley, CA 94710. (415) 841-5720. An equal opportunity employer.

NATIONAL BUREAU OF STANDARDS
INSTITUTE FOR COMPUTER SCIENCES AND TECHNOLOGY

OPPORTUNITIES FOR CHALLENGING POSITIONS IN COMPUTER SCIENCE AND TECHNOLOGY

COMPUTER SCIENTISTS AND PROGRAMMERS needed to:

- perform laboratory studies of high-level network, packet-switched and satellite networks, computer-based office systems protocols, and local area network protocols (CSMA and token access methods);
- perform advanced research in computer network technology including advanced network architecture design, network operating systems, and protocol design techniques;
- participate in national and international technical committees to develop networking standards; and
- design protocols using finite state machine methods.

Desirable experiences include protocol design, implementation and testing, an understanding of operating system principles, use of block structured programming languages, and work with technical committees. An undergraduate degree which consisted of 30 semester hours in mathematics, statistics and computer science and included differential and integral calculus courses is required in addition to at least three (3) years of experience in the computer science field.

For the research positions, desirable experience also includes research in advanced development of network architectures, data communication technologies, and protocol design. A Ph.D. in computer science or a related field is preferred.

These positions range from the GS-12 to GS-15 grade levels depending upon qualifications and experience and offer competitive salary, excellent career benefits and professional growth opportunities. Please send your Personal Qualifications Statement (SF-171) to:

U.S. Department of Commerce
National Bureau of Standards
Administration Building, Room A-129
Washington, D.C. 20234

Attn: Ms. Josephine White (C2340)

The National Bureau of Standards is located in modern facilities in Gaithersburg, Maryland, and is an Equal Opportunity/Affirmative Action Employer. U.S. Citizenship is required.

SYSTEMS PROGRAMMER III

The University of Alaska Computer Network (UACN)

The UACN provides the Statewide University of Alaska System academic and administrative computing and data communications services. The Systems Programmer III is responsible for the development and management of computer operating systems and programs as well as the supervision of supporting technical and related clerical personnel. Major duties include determining hardware and local systems software requirements and recommending optional configurations to satisfy these requirements. As a minimum, the successful candidate must possess a knowledge of systems software development and maintenance and skills in selecting, training and supervising systems programmers and/or support personnel. Also, abilities to evaluate EDP equipment and software, to determine requirements for new software, and to supervise the design, implementation, maintenance, and documentation of systems software are required.

The position is located in Fairbanks, Alaska and will report to the Director of Network & Operations. The salary range begins at $44,574 D.O.E.

Application letters, together with a resume and at least three professional references, must be postmarked by June 30, 1984 and sent to:

Statewide Office of Human Resource Development
University of Alaska
206 Tanana Drive, Room 1 Bunnell Building
Fairbanks, Alaska 99701

Your application for employment with the University of Alaska may be subject to public disclosure should you be among the finalists for the position. The University of Alaska is an Equal Employment/Affirmative Action Employer and Educational Institution.

Move Up To The Leader In San Francisco

At Bank of America, we are setting a goal for ourselves of being the leader among the world's financial institutions. Our goal is to provide the leadership in serving people, placing our customers first, respecting, recognizing and rewarding employees and making the most of technology. We would like you to share our goals and strengthen our team.

Our Consumer Information Systems Division, located in San Francisco, is committed to developing and installing a statewide item processing bookkeeping system and we are looking for Data Processing Professionals with exceptional technical and interpersonal skills to join our C.I.S. team. This project, along with the development of the MICR Capture System which is now being used by all banking facilities, adds to our continuing success and solid reputation in defining, developing, and establishing the needs for future electronic banking. As a team member in one of the world's largest Data Processing centers, you will be creating new and highly sophisticated systems in our state-of-the-art MVS/XA and MVS/370 environment using structured COBOL, IBM OS Assembler, SCI techniques, and top-down design.

With Bank of America, you'll have the career potential possible with a leading organization.

Consider our openings for:

- **Group Systems Manager**
- **Project Manager**
- **Sr. Programmer Analyst**
- **Programmer**

If you have hands-on experience in one or more of the following areas, we want you on the team:

- Electronic Transfer Delivery/Controls
- Structured Programming Methodologies
- Check Reader Sorter
- Cycle Sort/Bulk Filing
- IBM Assembler Language Coding and Design Experience
- Structured COBOL Techniques and Top-Down Design
- TANDEM/TAL
- Banking/ACH

Bank of America offers competitive salaries and incentives, including a comprehensive benefits package and relocation assistance program.

For immediate consideration, and to make arrangements for a local interview, please send your resume to: Jacquie Bellino, Staffing Specialist, Bank of America, Personnel Operations, Dept. 3681-0319A, 150 Spear St., San Francisco, CA 94105. We are an equal opportunity employer.

SYSTEMS ANALYST- BUSINESS APPLICATIONS

We are embarking on a long-range project to integrate business applications using state-of-the-art technology. Your experience in the design and implementation of real-time integrated data base systems should include such applications as Manufacturing Resource Planning, Material Management, and Financial Management. You will be working with user departments developing detail system specifications, preparing project summaries, evaluating alternatives, recommending proposed solutions with related cost/benefits. Aerospace background a plus.

We offer an excellent salary, comprehensive benefits program which includes medical, dental and life insurance; 100% advance tuition payment, savings and investment plan; and relocation assistance (if necessary). Please forward your resume with salary requirements to:

Ms. Beverly DeAngelo, Professional Employment, ITT Avionics Division, 390 Washington Avenue, Nutley, New Jersey 07110.

The Recruitment Connection...

... the best connection to have when you are looking for quality computer professionals. There is a good reason why COMPUTERWORLD is the number 1 computer industry trade newspaper. No other newspaper of its kind can give you the broad exposure that you will get by advertising in COMPUTERWORLD. It is read by over half a million people, most of them top-notch professionals with top-notch computer companies.

COMPUTERWORLD publishes every Monday and the deadline for receiving your advertisement is always ten days prior to the issue date desired. The open line rate is $9.15 per line with a minimum size of 2 column inches. Send in either camera-ready material or clearly typed copy with a layout if desired. We also have a telecopier service and ad-takers who will gladly take copy over the phone.

Our mailing address is **COMPUTERWORLD, Classified Advertising, 375 Cochituate Road, Box 880, Framingham, MA 01701.** Or call for more information at 1-800-343-6474 or, in Massachusetts, (617)879-0700.

PROGRAMMERS
IBM SYSTEM 38
DIGITAL 11/70 (RSTS/E)

Ventron, a specialty chemicals division of Morton Thiokol, Inc., located just north of Boston, is growing at a rapid pace. To meet the challenges of expanding markets and increasing business, our MIS staff is assuming more responsibility and needs additional support.

Converting to an IBM System 38 during the past 18 months and increased business applications in this area has created an opening for a programmer on the IBM system. Retaining our Digital 11/70 requires competent personnel to maintain this area of programming as well. Two programmer positions are currently open:

IBM SYSTEM 38

As part of the IBM effort, you will be working with a state-of-the-art data base, a virtual machine, and software packages that perform financial and distribution functions. The desired candidate will be strong in RPG II or RPG III with at least 1 years experience in addition to a college degree in Business or Data Processing.

DIGITAL 11/70 (RSTS/E)

As part of the DEC effort, you will be enhancing existing business applications and assisting in any IBM conversion. The desired candidate will be strong in BASIC PLUS with at least 1 years experience in addition to a college degree in Business or Data Processing.

Please send your resume and salary requirements to:
JUNE A. VETTER
Personnel Administrator

MORTON THIOKOL, INC.

Ventron Division
150 Andover Street, Danvers, MA 01923
An Equal Opportunity Employer M/F

DATA PROCESSING INSTRUCTOR

We have a challenging opportunity available for a dynamic individual with the technical background and teaching skills necessary to develop, maintain, and conduct an effective, corporate-wide Data Processing education/training program.

The successful candidate will teach state-of-the-art data processing courses in a classroom environment utilizing multi-media aids including video and computer based training. Subject matter will encompass: MVS/JCL; Utilities; TSO CLIST; programming concepts; and some user and microcomputer languages.

Applicants must possess a Bachelor's degree in Computer Science, Business or Education, and a minimum of four years experience in developing and teaching Data Processing courses. Excellent oral and written communication skills are essential. Familiarity with multi-media presentations is desirable.

This position offers a competitive salary plus an excellent benefits program that includes company paid medical, vision care, dental, pension plan, life insurance and educational assistance.

If qualified please forward your resume in confidence to:

CYNTHIA JOHNSON, DEPT. C.P.
NORTHEAST UTILITIES

Hartford, CT 06141

ASSISTANT PROFESSOR
COMPUTER SCIENCE
Smith College

Applications are invited for a new tenure-track position in Computer Science. Initial appointment is for a 3-yr. period. Candidates with a Ph.D. degree in Computer Science will be given preference. Smith College has an undergraduate Computer Science major, now in its second year, and currently has a full-time Computer Science staff of 5 who teach undergraduate courses at the introductory, intermediate and advanced level. The teaching load is 6 courses per year. Candidates should have an interest in teaching and research. A VAX 11/780 and a VAX 11/750, as well as many microcomputers, are dedicated to academic use. Facilities at the University of Massachusetts at Amherst are readily available. Smith College is currently installing a local area network. Northampton is located on the Connecticut River in western Massachusetts, approximately 2 hours drive from Boston, 3 hours from New York City and within minutes of the Berkshire mountains. Smith is one of 6 institutions of higher learning located in the Pioneer Valley. All are connected by a free commuter bus system. The University of Massachusetts has an excellent, active Computer Science graduate program. Salary is $26,000 with excellent fringe benefits including full TIAA/CREF contributions and full pay during sabbatical leaves. Applicants are asked to submit resumes and 3 letters of recommendation by April 15, 1984 to: Bent Henderson, Computer Science Committee, McConnell Hall, SMITH COLLEGE, Northampton, MA 01063. Smith College is an Equal Opportunity Employer.

SOFTWARE PROFESSIONALS

THE COMPANY THAT BROUGHT YOU LAST YEAR'S BREAKTHROUGHS WILL DO IT AGAIN THIS YEAR.

COME TO DATA GENERAL AND BE PART OF IT.

Last year, Data General startled the industry with the introduction of DESKTOP GENERATION™, a state-of-the-art microcomputer system. That's just the beginning. In Research Triangle Park, NC, we are working to ensure our continued success.

If you're interested in a career where innovation and commitment matter, we have immediate openings in the following areas:

UNIX*

Data General is committed to providing UNIX capability throughout its entire product line. We are doing development at all levels of the UNIX system—system calls, commands, and communications. Candidates must be fluent in the C programming language and have a working knowledge of UNIX. Knowledge of UNIX internals is a plus.

ARTIFICIAL INTELLIGENCE

We're working on major AI tools components. The emphasis is on tools rather than applications and requires an MSCS (or equivalent) and related experience.

DATABASE MANAGEMENT

We're developing a relational DBMS that operates in both centralized and distributed environments. The DBMS supports programming language interfaces, user interfaces and highly available database processors.

LANGUAGES AND TOOLS

We're building compilers, general compiler components and tools to provide an integrated software development environment. We're using a high-level language that stresses portability and ease of use.

□ □ □

The superior living, recreational and cultural opportunities of the Research Triangle area can make your off-the-job life very enjoyable. In addition, there are three top universities nearby.

Send your resume (indicating area of interest), to: John Bushfield, Dept. CW, Data General Corporation, 62 T.W. Alexander Drive, Research Triangle Park, NC 27709. Investing in people to make equal opportunity employment a reality.

Data General
careers a generation ahead.

DATA PROCESSING PROFESSIONALS

DALLAS OPPORTUNITIES

A national network of major financial institutions depends on Peer Services, Inc. for state of the art D.P. solutions and timely information flow. We're the leading edge in specialized financial capabilities due to our emphasis on systems development and advanced technologies. We offer the opportunity to become part of a participative management concept, with professionally rewarding careers available now for:

DIRECTOR OF DATA CENTER

This position will be responsible for all EDP operations activities including hardware, help desk, systems software and operations support in a large IBM environment (3081/3083). Minimum requirements for this position include 6 to 9 years' in data processing with a minimum of 4 years' operations management experience including budgetary administration and departmental planning with corporate policy.

SENIOR SYSTEMS PROGRAMMERS
(IBM and Tandem)

Our needs currently consist of several experienced Senior Systems Programmers for both our IBM 3081, 3083, and our Tandem NonStop II computers. Your position would involve designing our on-line integrated software system. Additionally, our state of the art environment includes MVS/XA, IMS DB/DC and CICS. Your experience should include a minimum of 2 years in one of the following areas: MVS, IMS, DB/DC, CICS or Tandem. Additional experience in TAL or Pathway would be a plus

SENIOR SYSTEMS ANALYSTS

We are currently looking for several Senior Systems Analysts to work on developing our on-line integrated savings & loan system. Additional positions are also available in our Customer Service Department where you would be primarily involved in the installation and support of this system. If your qualifications include 6 years COBOL and OS JCL as well as experience in one or more of the following areas: Loans, Deposits, CIF, ATM, MSA General Ledger, IMS DB/DC, and you would like to be rewarded for the efforts of your work, then consider Peer Services as your career alternative.

We pay top-level salaries and have a comprehensive benefits package including dental insurance. Please call or respond with your resume. All replies will be held in strictest confidence.

OS DESIGNERS AND ARCHITECTS

PRIME IS LAUNCHING A MAJOR NEW OPERATING SYSTEM DEVELOPMENT EFFORT

GET ON BOARD NOW

Since October of 1972 when Prime introduced the 200, the world's first minicomputer to use all MOS memory, we've been the leading innovator in our industry. Today our Operating System and Communications Development Groups are in the initial stages of development on the first major commercial distributed operating systems to be introduced in this decade.

If you're a Designer or Architect with distributed processing and/or operating systems experience, this is a rare opportunity. Building on our existing talent base, we're expanding the capability of our OS Development Group to meet this latest challenge. This has created a significant number of ground floor opportunities at all levels. Prime has made a total commitment to the success of this project and is providing this group with the resources necessary to complete this task.

Our concern for our employees is reflected in our outstanding compensation and benefits package as well as our on-site health centers that provide a full range of fitness activities.

If you feel that now is the time to get your career back on a fast track we invite you to send your resume to Dale Welch, Dept. CW319, Prime Computer, Prime Park, Natick, MA 01760. Prime is an affirmative action employer seeking outstanding individuals.

MEDSTAT SYSTEMS, INC.

SOUTH PACIFIC

The TERRITORIAL GOVERNMENT OF AMERICAN SAMOA announces several vacancies at its Computer Center.

Current hardware consists of two 1MB NCR V8465 computer systems. A large conversion task from batch processing to an on-line, integrated financial management system is about to begin using software packages supplied by Moore Data Systems Inc. The government is recruiting for the following contract positions:

Deputy Director for the Information Systems Division (1)

Responsible for planning, directing and evaluating the various functions of the Information Systems Division; under the administrative direction of the Treasurer and managing a staff of twenty-two, the Deputy Director supervises all technical and operational data processing activities of the American Samoa Government. Basic qualifications include a Bachelor's Degree and eight years of progressive responsibilities in data processing systems, at least three of which should have been on the managerial level; a salary for this position will be commensurate with qualifications and experience.

Computer Programmer/Analysts (4)

Requires a Bachelor's Degree or equivalent in computer science, mathematics or closely allied field plus six years of data processing experience; one of these positions will include managerial responsibilities. Salary range: $19K to $25K.

In addition to these minimum qualifications the successful applicants should have working experience using multi-programming operating software, COBOL 74, on-line concepts and methods as well as programming experience with typical financial applications. Knowledge of NCR's VRX O/S, RPG and system software support are highly desirable.

The American Samoa Government provides free transportation and shipping allowances for contract employees and their dependents. These positions are non-Federal employment for a two year term and include benefits such as twenty-six days annual leave, on-island medical care and furnished housing for a nominal monthly rent. American Samoa is a Territory of the United States and is located in the heart of Polynesia; it enjoys a year-round tropical climate and an informal lifestyle similar to Hawaii.

To apply for one of these vacancies, please state which position you are applying for and airmail a complete resume and copies of your credentials to: The Director, Office of Manpower Resources, **AMERICAN SAMOA GOVERNMENT, Pago Pago, American Samoa 96799.**

DEADLINE FOR RECEIVING APPLICATIONS IS March 30, 1984. Selected interviews will be conducted in the United States during April with a probable commencement date in late May or June 1984.

All applicants will receive consideration without regard to race, color, religion, sex or national origin. AN EQUAL OPPORTUNITY EMPLOYER.

OPERATING SYSTEM SPECIALIST

East Stroudsburg University is seeking an individual with an in-depth understanding and at least one year of full-time working knowledge with responsibility for medium to large scale multiprocessing operating systems, preferably Burroughs MCP. Responsibilities of the position include maintenance of the operating systems and a custom transaction processing system, technical support to administrative development staff and academic users, and some applications development. The University currently has a Burroughs B6900 with 8 meg of memory and approximately 100 terminals.

Knowledge of Burroughs ALGOL and COBOL are highly desirable. Candidate should possess a bachelor's degree in computer science, data processing, or a related field. Experience may be substituted for the educational requirement. Good written and oral communication skills, and a demonstrable proficiency in programming are essential.

This position is to be available on May 1st. Salary range is 20K to 28K, depending upon experience. The position features a generous benefits package, an attractive location, and good working conditions.

Interested persons should submit resumes by April 1st to:

Systems Professionals

We at Alcoa are looking forward to a major systems project for a Computer Integrated Manufacturing (CIM) system. If you have the capabilities and background to help us succeed, opportunity and reward await you.

You must possess a desire to accomplish and an impatience with the status quo. You will have a strong background in process control/systems software with expertise in one or more of the following:

- Top-down structured design concepts.
- Distributed database design.
- Layered products systems.
- Fault simulation.
- Large networking, integration and control.
- Microprocessor integration.
- Systems Engineering.

Strongly consider the rewards of becoming a part of the winning team in Pittsburgh to design, develop and implement a state-of-the-art CIM system. Engineering and DEC/VAX backgrounds are a plus.

Send resume to Julie Petkovitis, Dept. CW, 1501 Alcoa Building, Pittsburgh, PA 15219. Alcoa is an equal opportunity employer.

We can't wait for tomorrow!

ALCOA

GROUP LEADERS/ SOFTWARE ENGINEERS

You will be responsible for the design and implementation of data base applications and utilities of fault-tolerant operating system development, including development of a multi-processor UNIX-compatible transaction processing system. You will also analyze data processing requirements, plan layout and provide conceptual design for the type of computer and peripheral equipment associated with operation.

You should have 6 years' experience in systems and/or computer engineering. A B.S. or M.S. in Engineering or Physical Sciences and knowledge of UNIX, "C", DEC, PDP-11, Assembly language, RSX-11M and Micro-11 are desired. You will work 40 hours/week, 5 days/week.

There's No Time For DOWNTIME!

So while the industry works on your system's problems, let us work on your business problems. Advertise in—

COMPUTERWORLD CLASSIFIEDS!

One insertion will let a potential audience of over a half a million readers know what you are looking for or have to offer. Whether you are looking to recruit computer professionals, want to buy, sell or lease equipment, have computer time or services to offer, or software packages to sell, and more, Computerworld Classifieds will help you get a lot of exposure and get things done faster.

The open line rate is $9.15 per line and there is a minimum size of 1 column by 2" at a cost of $256.20. We can accomodate up to 5 columns and depth measurement increases by half inch increments.

Ads may be mailed in, clearly typewritten, with a letter stating the size desired and the issue in which it is to be run. Our adtakers will take ads that require no artwork or borders over the phone. We also provide telecopier service.

Any borders, logos, or artwork should be sent in with your ad and must be dark and clear enough to be reproduced.

Computerworld comes out every Monday and our deadline for receiving ads is 10 days (or six working days) prior to the issue date desired.

First time advertisers must send either payment or a purchase order along with their first ad.

Our mailing address is:

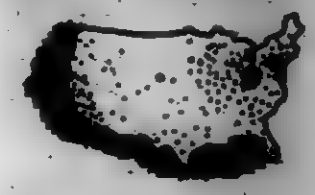
RANDOLPH'S APPROACH TO COMPUTER LEASING... AND WHY IT WORKS.

Started in 1964, Randolph has been saving its customers 30% to 70% of their DP hardware dollars . . .

And we *know* leasing is still the most financially attractive method of acquiring computer equipment at low cost without draining working capital.

But we learned early that the dollar-and-cents approach to computer leasing is only part of a company's concern. Equally important are: prompt installation . . . dependable servicing . . . flexible upgrade capabilities . . . and full support services. Our commitment to *this* approach is the key to satisfied customers . . . and our success.



RANDOLPH . . . COAST TO COAST
We presently serve customers in over 300 cities and towns from Maine to Hawaii.

EQUIPMENT ON THE MOVE
We have under management IBM computers with an original cost of over one-half billion dollars . . . and we're adding to this investment to meet the changing needs of our customers. Whether it's an IBM 3081 or 4300 system, additional tape drives, disk storage, printers or other peripherals, our equipment inventory is available to meet your company's requirements. Even hard-to-get machines are sought out and acquired for Randolph customers.

BUT . . . SERVICE MAKES THE DIFFERENCE
The real story behind Randolph's success is our approach to customer support services. To keep computer operations running smoothly and efficiently, these support services have proven to be valuable assets to our customers' D.P. operations.

Continuous IBM Maintenance Program
Manufacturer's service is available day or night, seven days a week, to insure optimal use of your system.

On-Going Technical Support
Randolph's technical staff is on call to help you reconfigure your system to meet changing data processing requirements.

Active Remarketing Division
We assure maximum return on your investment in computer equipment which you no longer use.

MEMBER OF THE FIRST NATIONAL BOSTON FAMILY
In 1972, The First National Bank of Boston purchased our S/360 leasing business, and we became a wholly-owned subsidiary.

With the Bank's financial capabilities behind us, Randolph customers benefit even more from the combined efforts of the best computer leasing and financing people in the United States.

HOW ABOUT YOU?
If your company is not presently leasing computer equipment from Randolph, you'll be interested in our new brochure outlining our special customer support services, and important facts on how we can reduce your computer costs. Call Joseph B. Kelly, Jr., Executive Vice President, 800-243-5307.

BIDS & PROPOSALS

INVITATION TO SUBMIT PROPOSALS

Mount Saint Mary College intends to procure an educational computer system of approximately 20 interconnected student positions serviced by common disks, printers and associated equipment. Those interested in receiving the specifications for proposal submission should provide brief comments on their qualifications to the address below not later than 29 March 1984.

Director of Computer Science
Mount Saint Mary College
Powell Avenue
Newburgh, NY 12550

BUYING?

Whether you're looking for big computers little computers, terminals, printers, software, time sharing or services, you'll find it in *Computerworld* classifieds.

Pages of ads every week, with everything from Discs to DEC's from time sharing to terminals, and software for every size computer system.

You'll find what you need in *Computerworld* classifieds.

Call 800-343-6474 (or 617-879-0700) for more information

The Bulletin Board

THE BULLETIN BOARD

A Low-Cost Way to Sell Hardware and Software in Computerworld.

What is The Bulletin Board?

It's a classified section in Computerworld designed especially for the selling and buying of individual pieces of hardware. It is especially suited to companies that have a piece of used equipment they want to sell. For one low price, you can inform more than half a million Computerworld readers around the country of your equipment's availability.

How Does The Bulletin Board Work?

Bulletin Board ads come in standard units (one column wide by one inch deep) and standard typefaces. (Units may be combined to produce deeper ads, but one column is the maximum width and no units of less than one inch are available.) Ads are arranged under headings (such as "IBM", "DEC" or "Printers"). The headline of the ad is set in larger, bold type, and should contain the standard equipment identification. The body copy should describe the equipment very briefly and give the person to contact. This is all the information an interested buyer needs to follow up. No ad should have more than one piece of equipment or software.

The price for each standard unit is only $130.00. There is a one unit minimum and no fractional units available.) Anyone can place an ad, but no agency commissions are paid, no quantity discounts allowed, and no credit toward rate is given for contract advertisers who advertise in other sections of Computerworld.

How to Place an Ad in the Bulletin Board.

Ads are accepted in the mail, by phone or by telecopier. Ads can be accepted up until the Monday before issue (7 days in advance of issue date). (The standard size will hold approximately 25 words of copy.)

Once you've written your ad, send it in with the coupon or call one of our ad-takers. (If your company has never advertised with us before we request a check or purchase order number with your order.)

Remember that all ads are standard. No special typefaces, no borders and no logos are allowed. Ads are set on a six-column page in our classified section under the heading "The Bulletin Board.". We assume no liability for errors beyond the price of the ad in the case of material errors.

ORDER FORM

COMPUTERWORLD BULLETIN BOARD

Issue Date: Ads can be accepted up until the Monday preceding the issue desired. Computerworld comes out every Monday.

Classifications: Most ads will be classified according to the brand of equipment that is being bought or sold. These classifications include Burroughs, Data General, Digital/DEC, Hewlett Packard, Honeywell, IBM, NCR, Sperry Univac, Storage, Terminals, Misc. Systems and Miscellaneous.

Copy: Copy sent in via the mail or telecopier (telecopier extensions and 410 and 481) should be clearly typewritten. Ads may be given over the phone to our ad takers. The standard size is 1 column by 1 inch deep. These units may be combined to form larger sized ads. Describe the equipment very briefly, give the price and the name of the person to contact. All ads will be set up using a standard format. No borders or logos are allowed.

Cost: The price for each standard unit is $115.00 (One unit minimum and no fractional units allowed.) There are no agency commissions and no quantity discounts.

Billing: Once you've written your ad, send (or call) it in with your name and address for billing purposes and we'll run it. (If your company has never advertised with us before, we request a check with your order.)

Transplant with PCR, for a stronger distribution system

If the heart of your distribution system skips a beat now and then, you may need an RMS/38 transplant. RMS/38 for the IBM/38 is a complete distribution operations and planning system that lets you better utilize warehouse inventory, provide current out-of-stock and short information to reps for better customer service, provide demand and shipment information for more efficient purchasing, anticipate credit problems rather than react to them.

RMS/38's nine powerful applications also allow financial management, generation of user reports with its query facility, and a PC link that lets you transfer information to your IBM Personal Computer for interaction with popular micro products. Plus advanced data base architecture which allows direct access to all stored information, making expansion simple and economical.

For a free demonstration or more information, **contact PCR, Professional Computer Resources, 3021 Midwest Road, Oak Brook, IL 60521** (near Chicago). Also in New York, San Francisco, and Los Angeles.

SECURITY

Protect sensitive information with *Ven-Tel's 212 SECURITY PLUS*. Password restrict any terminal to calling only the destinations and applications you authorize. Telephone numbers, passwords, account numbers, and log-in codes are concealed to prevent unauthorized disclosure or use.

Ven-Tel security is not limited to password protection. You are secure in the confidence that your Ven-Tel modem is the most reliable and dependable in the world.

Security is the assurance that Ven-Tel has committed the investment in research, development and production facilities necessary to continued industry leadership and provide off-the-shelf delivery.

Security is knowing that the modem you buy from Ven-Tel is the most modern, technologically advanced product available on the market today. It is knowing that when you need help, a Ven-Tel technical support specialist is as close as a telephone call. It is the confidence that Ven-Tel will be there with service and support for your equipment as long as you own it.

For information call: (800) 538-5121

IBM replaces aging 3420 tape drive with subsystem for MVS sites only

By John Gallant
CW Washington Bureau

RYE BROOK, New York — IBM last week announced the long-awaited successor to its 3420 tape drive. The new IBM 3480, which replaces the standard 10.5-in. tape reels with 200M-byte tape cartridges, features a data buffering controller and more than double the read/write speeds of the aging 3420 units.

IBM said the new tape subsystem attaches to the 30 series, and the 4341 and 4381 processors using the MVS/XA and MVS/370 operating systems. A new Data Facility Hierarchical Storage Manager, Version 2, allows data management in the 3480 plus the 3420, IBM disk drives and mass storage devices in those operating systems, the company added.

IBM said the 3480 offers a nominal data transfer rate of 3M bytes/sec, compared to the 1.25M bytes/sec of the 3420 Model 8. The recording medium is an 18-track, 1/2-in. chromium dioxide tape with a 38,000 bytes/in. density housed in a 4- by 5-in. cartridge. The drives use thin-film recording heads and replace the vacuum columns with reel-to-reel servo control technology.

The drive units themselves consume only about half the space of a 3420 and require 60% less power and cooling capacity

IBM unwraps low-end model of top 8100

By Tom Hanchett
CW Staff

RYE BROOK, N.Y. — IBM last week announced the 8150 Model A, an entry-level model of its 8150, the top-of-the-line 8100 distributed processing system. In addition, the company doubled the disk storage capacity on the entire 8100 line by unveiling a double-density version of its 8101 disk drive.

At the same time, IBM announced a board-level device that allows users to attach IBM Personal Computer and Personal Computer XT microcomputers directly to 8100 systems.

The 8150 Model A announced last week will be available in June in 1M-, 2M- and 3M-byte main memory configurations. The larger 8150 Model B, which was announced last October, comes in 2M-, 4M- and 6M-byte configurations.

Aside from offering a smaller main memory, the 8150 Model A processors are virtually identical to the 8150 Model B processors, an IBM spokeswoman said. The A models were announced to offer users of the smaller 8140 processors a more convenient bridge to the 8150 line, she explained.

The 1M-byte 8150 Model A costs $75,000, the 2M-byte version costs $82,500 and the 3M-byte machine is priced at $90,000. Volume discounts ranging from 10% on purchases of five Model A systems to 35% on purchases of 45 or more systems are available.

Besides the 8150 Model A, IBM last week also announced the 8102, a double-density version of the 8101 disk drive. The 8102 is available in two 129M- and 258M-byte capacities; the single-density 8101 of-

FYI

He reached out and touched no one

By John Dix
CW Staff

BOSTON — Try as he might, a customer of AT&T Communications recently found that communicating with his long-distance communications company was like trying to reach out and touch someone in a game of blindman's buff.

G. L. Clarke, a lecturer at Boston University's School of Management and facilities director for a local company here, said that when he called his Boston-based account representative to place an order for a 9,600 bit/sec Dataphone Digital Service circuit, he was told that his account had been shifted to New York.

New York representatives told him his account was held in Boston.

Stonewalled, Clarke called directory assistance for help. There was no one home at the number given to him.

He called back directory assistance, which gave him another number. The people at the second number were apparently at the same coffee klatch as the operators at the first location.

A third number called up a modem answer-back tone.

Computerworld gave it a try. The first and second numbers provided by directory assistance were never answered, and the third induced the high-pitched mating call of a lonely modem.

In desperation, Clarke called on a few friends at New England Telephone Co. They gave him a local, unlisted AT&T Communications number that was answered by a man who was able to help him.

The first thing Clarke learned was that to merit a personal AT&T Communications systems consultant in the divested world, you now have to have annual billings of $60,000 or more (making you a major account, as distinguished from a primary account, which spends less than $60,000 per year with AT&T Communications). Clarke maintained that he was never told this and, further, that AT&T has apparently never bothered to figure out who falls into the new category.

The second thing that Clarke learned from his contact was that "stated delivery" for DDS circuits, the time frame in which the company claims it will install a new circuit, is now 48 business working days. Before divestiture, Clarke said, he could count on getting a DDS circuit installed within 22 working days.

And this, apparently, is not a singular case.

James Barr of AT&T Communications

Panel studies plan to track cash transfers

To provide 'dirt' on laundering

By Patricia Keefe
CW Staff

WASHINGTON, D.C. — An automated tracking system may one day provide federal officials with the dirt on illegal money laundering schemes, but at least one federal law enforcement official does not think the system is necessary.

At the suggestion of its chief counsel, James Harmon, the President's Commission on Organized Crime is studying a proposal to establish a computerized system that will track all large cash deposits and international wire transfers involving U.S. banks.

It is hoped that by computerizing "from A to Z" the channels through which these funds travel, more pertinent information will be recovered faster for law enforcement use, according to a spokesman for the commission.

Noting that some banks have looked the other way concerning suspicious transactions, the spokesman said the commission hopes a computerized system will work together with a "volunteer effort on the part of the financial community to report information more quickly than they do [now]."

Refining a system model

The commission is in the process of holding hearings on the concept, as well as meeting with its financial and DP experts to define a system model better. A task force is being formed that will include representatives from the American Banker's Association, he added.

Federal law requires that reports be filed on cash deposits of $10,000 or more in U.S. financial institutions. Reports compiled manually have taken as long as six months to be filed in a manner usable by Treasury Department analysts, confirmed a federal law enforcement official opposed to the plan, who requested anonymity.

The reports must be entered into a Treasury data base before a Treasury analyst can review the material, typically 45 days after the department's initial receipt of the data.

Timeliness not a problem

Although proponents of automating the process estimate that Treasury analysts could receive the reports on the day the transactions occur, the official said timeliness is not a problem.

Analysts provide their results to other Treasury workers who are usually involved in long-term investigations, he said.

Other issues that the commission needs to consider, the official said, include a huge federal manpower shortage, the cost of the system vs. its benefits and the burden, if any, that will be placed upon the banking industry. He also suggested that as a result of a computerized system, the Treasury would be swamped with an increase in financial data, much of it useless for the department's purposes.

Dictaphone sued for $22.5 million

By James Connolly
CW Staff

LOS ANGELES — The partners in a defunct word processing service bureau are seeking $22.5 million in punitive damages in a suit filed here charging Dictaphone Corp. and Pitney Bowes, Inc. with fraud, negligent misrepresentation and operating a corrupt organization.

The federal court suit, now in the pretrial motions stage, charges that Dictaphone, a subsidiary of Pitney Bowes, cheated the Tarzana, Calif.-based Informacon when Informacon ordered a word processing system from Dictaphone in March 1983. Informacon, owned by Charles W. Gunther and Royce S. Fishman, lost more than $100,000 and went out of business because the hardware and software packages that it leased failed to work properly, according to the suit. The suit also alleges that some of the products never even existed.

Dandy Witty, director of public affairs and public relations for Pitney Bowes, commented, "We are defending ourselves vigorously. We don't believe there is any basis for the suit." She noted that the court already has denied Informacon's motions for injunctions against the defendants.

Informacon owners deceived

The suit, in which Gunther's attorney, Richard D. Farkas, filed an amended complaint last month, alleged that Dictaphone representatives and advertisements deceived the Informacon owners into believing that they would receive Dictaphone's Straight Talk software and Omninet networking system. Those products did not exist when Dictaphone stopped producing and selling word processing hardware and software on Oct. 10, according to the complaint.

Witty said Dictaphone continues to service its installed word processing base.

The suit also charged that products Informacon did receive were defective. Those products included the Dictaphone System 6000, with defective features such as pagination, multiple access to a printer and multiple font handling, according to the suit.

"In truth and in fact, the defendants ... never intended to supply word processing equipment with the capabilities as represented or to provide the continuing support as represented. The defendants well knew that they were unable to act as represented or to provide plaintiffs with the equipment as promised," the suit charged.

Other listed defendants, identified as current or former Dictaphone employees, were John Lindroth, Darrell Duran, Michael Pachelli and Emmanuel Westbrook.

NEWS SUMMARY

IBM and Merrill Lynch have joined hands once again, this time forming a venture to market financial data systems and services/4

A leading discount broker introduced a nationwide service enabling investors to trade securities through their own microcomputers/4

It took only 15 hours for Howard Johnson Co. to move its nationwide reservations system from a time-shared service to an in-house data center recently. However, a year of planning preceded the conversion/6

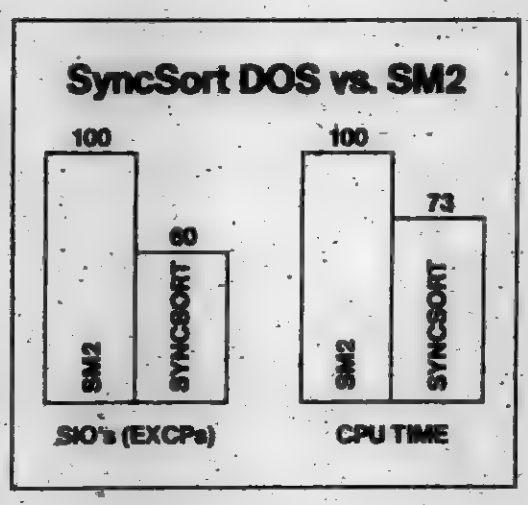
IN-LAWS

Smile, IBM. New SyncSort DOS is the perfect mate for your 4300 series!

Call (201) 568-9700.

Meet our new DOS/VS(E) release.



High performance computer without high performance sort program like bride without groom—expectation without fulfillment.

—Old Chinese Proverb.

* * * *

You say you just got this brand-new 4300 ? It's got big blue eyes, great price-performance curves and nifty disk drives? Now you're thinking about marrying it to IBM's 5746-SM2 sort program?

Well, don't do it pardner! The groom is definitely too old for the bride. Like IBM's other DOS sorts, SM2 is a hangover from an older generation of sorting technology.

There's only one sort around that's really fit for the hand of a glamorous new 4300 computer. And that's the latest release of SyncSort DOS. It's perfect for DOS/VS(E) and its new Fixed Block Architecture and VSAM type of data. Here's what SyncSort DOS can bring to the marriage:

1. BETTER PERFORMANCE. The first release of SyncSort DOS—back in 1978—incorporated many of the breakthroughs we made in OS sorting. Since then, in numerous releases, we've steadily cut the amount of resources that go into sorting. The new release carries on that old family tradition. Compared to SM2, SyncSort uses up to 50% less CPU Time and up to 70% fewer SIOs.

2. BETTER PROGRAMMER PRODUCTIVITY. SyncSort DOS has a host of features to cut the amount of programming time that goes into applications. You can often reduce the amount of time required for simple reports from five programmer days to one programmer day simply by using these features. They can:

- select relevant records;
- perform summaries on designated numeric fields;
- reformat records on output;
- insert character strings;
- convert numeric data to printable characters (including editing);
- produce reports divided into logical pages with headings, pagination and dating—and much more.

3. BETTER CUSTOMER SERVICE. We have the smartest Tech Service people in the business and the best and fastest service. About 85% of all requests for service are resolved within 24 hours. Try us and find out for yourself.

So if you'd like to match that phenomenal new computer with the perfect mate, give us a call. We'll send over one of our matchmakers to give you a personal demonstration.

Once you've seen SyncSort DOS in action, we don't think it'll be long before you call us with a familiar request: "Play it again, VSAM!"

Syncsort Incorporated 560 Sylvan Ave., Englewood Cliffs, N.J. 07632

IBM, Merrill Lynch set financial service

NEW YORK — IBM and Merrill Lynch Pierce Fenner and Smith, Inc. have joined hands once again, this time forming a venture to market financial data systems and services.

Two years in the making, the Financial Services System announced here last week will allow the installed base of IBM's line of Personal Computers to communicate largely via satellite links with Merrill Lynch's host computers to obtain an array of investment data and services. Software for the nationwide system will likely be provided by Monchik-Weber Corp., although this company will not share in the 50-50 partnership of IBM and Merrill Lynch in marketing the system.

The partnership will act as a systems integrator and remarketer, selling software, workstations, branch office and regional processors, real-time market data and related communications network services.

The prototype system, unveiled at Merrill Lynch headquarters, combines market data, information from stock exchanges and news services with advanced office automation and enhanced communications services tailored to meet the needs of Merrill Lynch's individual investors, the companies said. A pilot installation will not be up and running at a Merrill Lynch office until the second quarter of 1985, with a companywide ramp-up by the end of that year, a Merrill Lynch spokesman said.

Integrated systems

The venture's product offering will combine IBM Personal Computer-based workstations and host computers with market data and financial services programs provided by Merrill Lynch. The two companies will market these integrated systems to brokerage firms, commercial banks, money managers and the private clients of these firms.

The system also features use of the IBM 3270 Personal Computer, which will be used by the broker's account executives to track selected securities. Using the 3270-PC's windowing capabilities, Merrill Lynch executives will direct the 3270-PC to place calls automatically to clients interested in any of the 300 stocks the 3270-PC can be programmed to track.

At the same time, the executives will be able to use the workstations to run applications such as financial spreadsheet calculations, access customer files from a host system and update mailing lists, the companies claimed.

The workstations will be connected to a brokerage office's computer to provide market data services as well as a range of office automation capabilities, including word processing and, eventually, electronic mail via regional or host computers, the partnership said.

The joint venture marks the second time the two companies have combined forces in the information processing market. In 1982, Merrill Lynch became a principal provider of working capital for the IBM Credit Corp., IBM's equipment leasing branch.

Fidelity service allows trading via micros

By John Gallant
CW Staff

BOSTON — One of the leading discount brokerage houses last week announced a nationwide service that enables investors to trade securities through their own microcomputers.

Fidelity Brokerage Services, Inc.'s Investor's Express service, which starts operation today, allows customers to enter buy and sell orders on listed and over-the-counter stocks and options using most microcomputers or Ascii-compatible terminals equipped with a modem.

Communicating through GTE Telenet Communications Corp.'s Telenet packet-switched network, customers can access data bases residing on Fidelity's IBM 3083 mainframes at company headquarters here to obtain quotes, update their portfolios and review their tax records. Securities transactions entered by customers are reviewed by Fidelity's representatives and then transmitted to the stock exchanges through the firm's high-speed execution system, according to Fidelity President Robert L. Gould.

Securities trades can be settled automatically through a customer's Fidelity USA account or Fidelity money market fund, Gould said. He added that stock market quotes listed on the system are delayed approximately 20 minutes, but up-to-the-minute quotes can be obtained through an optional feature.

Customers will be able to transfer data for off-line analysis to micro spreadsheet and graphics programs, including Visicorp's Visicalc, Microsoft, Inc.'s Multiplan and Lotus Development Corp.'s Lotus 1-2-3.

Prices for the Investor's Express service include a one-time subscription fee of $195 and time-sharing charges of 40 cent/min during peak hours and 10 cent/min off peak, with a minimum monthly time-sharing charge of $10. Fidelity Brokerage Services is located at 82 Devonshire St., Boston, Mass. 02109.

Bomb blast damages IBM office building

By David Myers
CW New York Bureau

HARRISON, N.Y. — A late-night bomb blast last week heavily damaged an office building here leased by IBM. A terrorist group claimed responsibility for the attack, saying that IBM had been singled out as a target because of its business interests in South Africa.

No one was injured in the blast that occurred at 10:43 p.m. on Monday, March 19 at 3000 Westchester Ave. Damage was confined largely to the exterior of the building.

"There was a lot of broken glass but no structural damage," an IBM spokesman said from company headquarters in nearby Armonk, N.Y. The spokesman could not, however, give an estimate of the dollar amount of damage. He said the building housed "general administrative offices" employing 150 people.

The Harrison Fire Department responded to the blast, which also caused slight damage to an adjoining building owned by the Melville Corp., maker of Thom McAn shoes.

A known terrorist group calling itself the United Freedom Front claimed responsibility for the attack. "A written communique recovered in the parking lot singled out IBM as the target because of its business interests in South Africa," according to FBI spokesman Joseph Valiquette.

Ten bombings

Since first surfacing in December 1982, the United Freedom Front has claimed responsibility for 10 bombings. Valiquette said the group is under investigation by the FBI/New York Police Department Terrorist Task Force, but added that the FBI was "not prepared to say how large a group it is."

The terrorist group has named South Africa as the reason for each attack.

"We do business there," IBM's spokesman said when asked about the computer maker's dealings with South Africa. He said the company employs about 1,800 people, primarily in sales and service but also in a small punch-card printing operation. Revenues from the African nation make up less than 1% of IBM's total gross, he said.

IBM from page 1

fers a storage capacity ranging from 64M to 128M bytes.

By adding the newly announced 8102 drives, users of IBM 8140 and 8150 processors can store up to 1G byte of data.

The maximum amount of disk storage previously available was 512M bytes.

Combination of drives

Users can also mix any combination of 8101 and 8102 drives. Up to two drives can be attached to the 8130 Model A processors, up to three can be attached to the 8130 Model B, and four drives can be attached to the 8140 and 8150 processors, a spokeswoman said.

By using four of the 256M-byte versions of the 8102, users reach the maximum 1G-byte disk capacity, IBM said.

The 128M-byte version of the 8102, which costs $21,000, is field-upgradable to the 256M-byte unit, which is priced at $33,500.

June availability

Both will be available in June, according to the spokeswoman. The older 128M-byte 8101 costs roughly $25,000.

IBM last week also announced the 8100 PC Adapter, a circuit board that can be plugged into the backplane of either an IBM Personal Computer or a Personal Computer XT to allow the micros to run either 8100 applications simultaneously in IBM 3270 emulation mode or Personal Computer applications running under IBM's PC-DOS operating system.

The board also allows the micros to be directly attached to an 8100 system's loop wiring.

Controller not necessary

Previously, a controller was necessary to attach a Personal Computer to the 8100 system, according to IBM.

The device eliminates the need to use special cabling or a stand-alone controller when attaching the microcomputers to an 8100 system, according to IBM.

Scheduled for July availability, the PC Adapter costs $1,275, the spokeswoman said.

More information about the products is available from IBM, which made the announcements through its Information Systems Group, located at 900 King St., Rye Brook, N.Y. 10573.

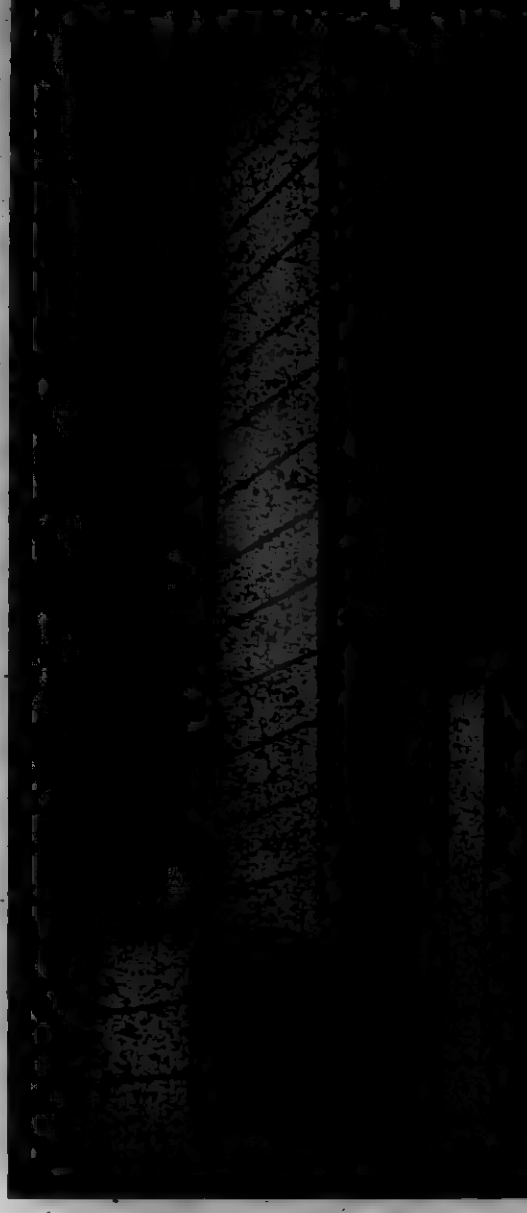
Now Xerox offers the best of both worlds for the price of one.



For the first time ever, you can get the most advanced Xerox manufacturing software, plus an IBM mainframe computer, in one complete, affordable system.

It's a new concept in computing. The Xerox Turnkey Manufacturing System includes everything you need for dependable, comprehensive information management. It's the very first system to bundle an IBM mainframe with efficient, industry-tested manufacturing, financial, and distribution software.

And because it's an off-the-shelf system, it can be acquired and fully installed at a price you never thought possible.

But price isn't the only thing that's remarkable. You get everything you need to run the system. You don't have to buy various components from different vendors and then build interfaces yourself. It's all been done for you. So there's no data processing staff to hire.

The Xerox Computer Services turnkey system has an advanced architecture that completely integrates business applications software, personal computing, information center software, decision support systems, a database manager, and fourth-generation languages. Each with user-friendly screens and "help" functions. Your current personnel can develop their own applications and handle their own information needs without assistance.

That means you get fast, economical installation, plus immediate payback in improved productivity and management control. All with minimum overhead.

And what about support? Xerox technical experts understand the manufacturing business and will help you with your system, from initial site planning to telephone hotline support after you're up and running. Of course, full documentation, training, and software maintenance are part of the package.

Best of all, this may be the last software decision you'll ever have to make. As your business expands and it's time to move to a larger computer, you can run the same software on any IBM mainframe, starting with the smallest 4300 series system up through the powerful 3084 model.

Have the best of both worlds in your world. If you need better control over your operations, but are concerned about finding a system that really fits your requirements and budget, let us tell you about our simple solution...the Xerox Turnkey Manufacturing System. Just fill in the coupon and we'll send you complete information and pricing by return mail. Or call Ron Rich at (213) 306-4000.

'HoJo' moves in-house overnight

Converts national reservations system from T/S service

By Paul Gillin
CW Staff

QUINCY, Mass. — It's 9 p.m. on a Friday night. You have 15 hours to switch an entire data center from Orlando, Fla., to a new location in Massachusetts.

If you are successful, the network will go on-line at noon the next day without a hitch.

If you fail, you will have a week to ponder what went wrong before starting the whole process over again.

The scenario sounds somewhat like one of those popular adventure computer games, but the adventure was reality for the Howard Johnson Co. recently. In one hectic evening, the management information systems staff switched the company's nationwide reservation network and processing center from a time-sharing service to a newly created in-house network and DP center here.

CW photos by P. Gillin

Waitress Karen Oster enters orders into Romanco Systems, Inc. RMS 1600 point-of-sale terminal at restaurant in Braintree, Mass.

The move was no small task. Howard Johnson's national reservations network extends to more than 500 member hotels and processes about 200,000 transactions per day. The software for the network was originally developed by National Car Rental System, Inc. and had been running on Martin Marietta Data Systems, Inc.'s remote computing service since 1980.

The decision to go in-house was motivated largely by cost. "Going in-house cut computing costs by about 25%, allows us to add applications and gives us control of our own destiny," explained Thomas Harries, director of data processing operations.

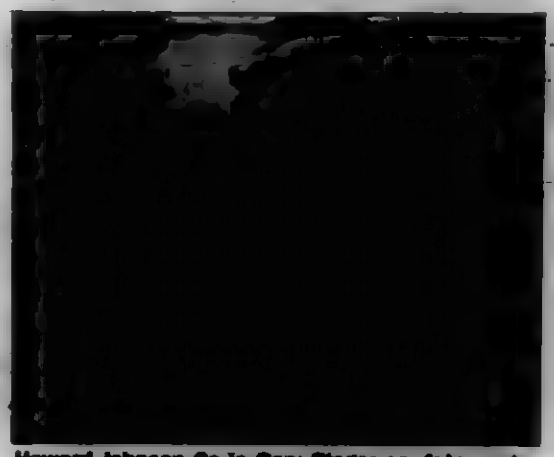
The savings were substantial despite the fact that the project required a major hardware upgrade. While Howard Johnson had been using an IBM 4341 for corporate data processing in its old data center, the new facility would include two IBM 3083s, one taking over the duties of the 4341 and the other handling the added burden of the reservation system. If the reservation system went down, the firm could easily switch over to the corporate 3083 and continue processing until the problem was repaired, Harries said.

The upgrade presented one problem on the corporate data side — all of Howard Johnson's financial software was written for IBM's DOS/VSE operating system, which does not run on the 3083. As a solution, the MIS department last spring installed IBM's VM operating system on top of DOS on the 4341 "just to get systems programmers up on it," according to Gary Singer, director of MIS technical services. The company now runs IBM's VM High-Performance Option on top of DOS on its new 3083 and plans to begin to convert to MVS later this year.

To make the transition as smooth as possible, the six Howard Johnson staff members who coordinated the conversion set up a configuration that Singer said is nearly identical to that at Martin Marietta. In November and December, the department staged two batch run-throughs, and in January it conducted two on-line run-throughs to test the hardware and software.

"If anything, this was planned to death," Harries said.

The tests involved flying copies of Martin Marietta programs and data from Orlando to Quincy, installing them in the Howard Johnson data center, switching communication lines to the member hotels temporarily to talk to the Quincy office and running trial transactions through the system.



Howard Johnson Co.'s Gary Singer on data center conversion: "You just have to plan it to death."

Communications presented another problem. Because Howard Johnson had been relying on Martin Marietta's network to communicate with the local hotels, the company had to install a leased-line network of its own and switch between the two during testing. Installation of the network's eight nodes in Chicago, Los Angeles, St. Louis, New York, Atlanta, Orlando, Washington, D.C., and Oklahoma City was completed in November.

Singer noted that the installation was rushed through to get in under the wire before the AT&T breakup. "If we'd had to do the same thing today, it would probably take twice as long."

On Friday, Feb. 3, at 9 p.m., the nationwide reservation system was shut down. While operations nodes were being switched over to the Howard Johnson communications network and tests were being run, Martin Marietta in Orlando was backing up disk packs for the Howard Johnson network onto 21 magnetic tapes.

The tapes were taken by two Howard Johnson employees to a chartered corporate jet for the flight to Boston. To be safe, other copies of the tapes were flown in early the next morning.

However, there was no need for the backup copies. The magnetic tapes were loaded onto the Howard Johnson disk packs and tested; both network and data center were running by 11:30 Saturday morning.

The key to a flawless conversion is foresight, Singer said. "You just have to plan it to death," he advised, "and don't burn your bridges. We took extensive steps to make it possible to continue processing if anything went wrong."

More than a conversion: New data center, upgrades, too

QUINCY, Mass. — The task of moving an entire national reservation network from a time-sharing service to an in-house DP center can present plenty of headaches, as the management information systems department at Howard Johnson Co. discovered here recently.

Not only did the department make the conversion, it also moved to a new data center and upgraded its hardware from an IBM 4341 to twin IBM 3083 mainframes, all in a matter of days.

At the same time, the switch gave the MIS department a chance to install some of the latest data center equipment, including a Halon fire extinguisher, power conditioners, air conditioning, two fully redundant water coolers as well as more working space.

However, the logistical details can be killers, said Thomas Harries, director of data processing operations.

"The biggest concern in moving was the fear of forgetting something," he recalled. "There's always that concern of whether we covered all the bases."

Some of the smaller items to consider included back generation of tapes, configuring communications gear to emulate that of the time-sharing service, wiring the building to plan for future growth, making printers compatible with the new hardware, planning the placement of cutouts in the raised floor and terminating the equipment in the right place.

One problem arose after the data center location had already been set near the top floor of the new office building.

"It was originally targeted to be under a restaurant until we realized the possibility of water damage," said Gary Singer, director of MIS technical services. "We moved it two floors down."

BUILDING A COMPUTER CENTER?

If you're planning a new expanded or remodeled DP facility, you need Datasphere's help.

Since 1968 Datasphere's unique combination of products and services has saved dollars, frustration and time for large and small firms around the world.

From turnkey—design/build computer rooms to the smallest support equipment, we'll do all or part—on schedule, within budget! Datasphere is unique—we're engineers, contractors and suppliers specializing in computer facilities.

Supplying a full line of support equipment, including:

- *Uninterruptible Power Systems*
- *Computer Power Centers*
- *Computer Fire Protection Systems*
- *Computer Type Air Conditioning*
- *Gas Turbines/Diesel Generators*
- *Operation Command Centers*
- *Elevated Flooring*
- *Frequency Converters*
- *Line Filters*
- *Security Systems*
- *Systems Monitors*
- *Voltage Regulators*

POS system prepares data to go for HoJo

By John Gallant
CW Staff

QUINCY, Mass. — As part of the reorganization of its information resources, Howard Johnson Co. is moving processing power out to its restaurants and motor lodges to facilitate the transfer of data between remote locations and the corporate data center here.

By month's end, 35 of Howard Johnson's nearly 1,300 restaurants and lodges will be equipped with a versatile point-of-sale (POS) system that enables managers at both levels to share payroll and financial information. Currently, data transfer between remote sites and the IBM 3083 mainframes is handled through dial-up telephone access, although future plans call for the uploading and downloading of data through Howard Johnson's leased-line reservation network.

The installation of the POS system is an integral part of Howard Johnson's recent moves to revamp its image and to refocus its data processing operations. This effort has also involved bringing DP functions in-house and relocating the data center to corporate headquarters here (see story on Page 6).

"Our thrust is to support this company during our period of change," said Eugene L. Daniels, vice-president of management information systems. "We aim to provide some type of processing system — whether it be a point-of-sale system or a microcomputer — for each of our properties."

As existing Howard Johnson and Ground Round restaurants are refurbished, the company is installing Remanco Systems, Inc. RMS 1600 POS equipment at a cost of approximately $30,000 per site.

Installation of the Remanco equipment is taking place at a rate of three sites per month and has been underway since July 1982. While no decision has yet been made on how many sites will be equipped with the POS processors, said Thomas J. Harries, director of data processing operations, the company is currently focusing on its more profitable restaurants and lodges.

The 16-bit microprocessor-based system functions in a dual role at the Howard Johnson sites. Waiters and waitresses enter orders from input stations on the restaurant floor, while 40-character printers print the orders for bar and kitchen workers and produce an itemized bill for the customer. The "back-office" portion of the system, which includes a CRT and an 80-character printer, automates a variety of management functions, including inventory control and personnel management.

The Remanco system is also equipped with a Cobol compiler that enables Howard Johnson's programming staff to develop application programs for the system. It has already helped programmers develop a payroll reporting program and a spreadsheet-like sales and cash report similar to manual forms already in use. Managers in restaurants without the POS equipment must complete and mail those forms to corporate headquarters each week for clerks to input to the mainframe.

At those locations equipped with the Remanco system, the payroll and financial information is input to what Harries described as "blank electronic forms" downloaded each week from the data center. The completed reports are then transmitted back to corporate headquarters via a modem, avoiding mailing delays and saving keypunch costs.

"We handle nearly 30,000 paychecks each week. With a two-day mailing window at each end, that leaves us with just three days to process all that data," Harries observed. "In addition, the Postal Service is threatening to stop mail movement on weekends. That would leave us only one day, and that's physically impossible. This system allows us to collect that data at the end of each week automatically without delay."

Howard Johnson plans to develop additional applications for the Remanco system, including programs that will utilize valuable marketing information assessed automatically in day-to-day operations. Harries said 12 restaurants equipped with the POS processors have been selected to perform nationwide market research, including menu planning and item movement studies.

Harries also noted that Howard Johnson's MIS staff is studying modifications to the company's leased-line reservation network that will accommodate data transfer to and from the systems during off-peak periods.

SAS Institute releases full screen editing facility

CW AT SUGI '84

HOLLYWOOD BEACH, Fla. — At its international users group meeting here last week, SAS Institute, Inc. introduced a full screen editing facility for its full range of products. The SAS Display Manager allows the user to interact with programming statements, logs and procedure outputs without leaving SAS, a spokesman said.

The tool splits the screen into two parts, with the top half displaying the SAS log and the bottom half showing the program entry and edit area.

SAS statements can be typed into the program screen, reviewed and edited without affecting the log, the spokesman said. The program lines are not entered until the job is submitted, at which point the result is displayed in the log.

Statements, errors displayed

The log displays statements submitted to SAS from the program screen, together with notes or error messages. A scrolling facility is provided.

When the program statements submitted contain a procedure step that produces printed output, the Display Manager displays the output one page at a time.

After the last page is displayed, reviewing can be continued in page or line mode or the user can return to the program/log screen.

In addition, the user can copy external data sets, edit files and submit them to run without leaving SAS, the spokesman noted. A save command enables all program lines to be copied into an external file and then recopied into the user's file.

Special function keys

Programmed function keys are employed for special functions, which may vary depending on whether the program/log screen or output screen is employed. Editing keys are used for standard editing functions and may be used both to edit program statements in the program screen or to enter commands on the command lines of the log screen or output screen.

The Display Manager has already been shipped to current users of SAS products on Digital Equipment Corp. processors. It will be made available as an enhancement to IBM mainframe users later this year, the spokesman said.

The option will be bundled into the next maintenance release of SAS, the company said. More information is available from SAS through Box 8000, Cary, N.C. 27511.

TAPE from page 1

than the older model. Maintenance requirements have also been cut, according to IBM, which said the new units need only weekly cleaning.

Announcement rumored

Commenting on last Thursday's announcement of the new drive, which had been rumored as imminent for more than three years, Jack Hart, director of professional services at International Data Corp., a Framingham, Mass. research and consulting firm, said the new products mean IBM has "really gone back into the tape drive business."

After several years of losing ground to Storage Technology Corp. in this line of business, Hart said that IBM has finally admitted to itself that "high-speed sequential processing with removable storage medium is still an important factor in many large DP shops, and it's not going to go away."

He noted the new drives, despite their improved speed and data buffer, use data cartridges that hold 200M bytes, only a slight improvement over the older 165M-byte reels. Users will still need at least six storage cartridges to dump one 3380 spindle.

But, he added, the advances in space, power, cooling and maintenance requirements will be very attractive to users.

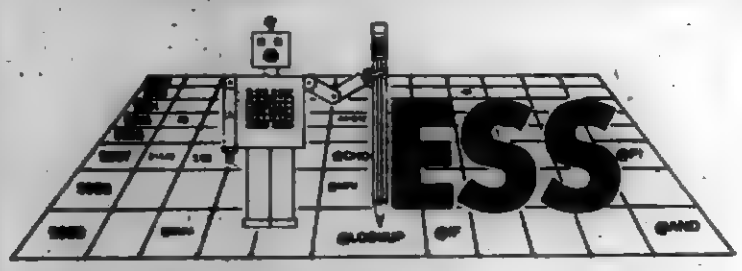
Also, he said, the error rate of the new unit is "phenomenal." IBM said the 3480 units will experience less than one permanent error for every trillion characters read.

Pricing structure

The company said the 3480 will be available in the first quarter of 1985. The 3480 Model B22 tape unit, containing two drives, is priced at $43,120. The A22 controller costs $65,430. IBM said a typical 3480 subsystem, consisting of one controller and eight drives, is priced at $237,910. The tape cartridges cost approximately $14 each in quantities of 10,000.

Volume purchase discounts start at 4% for 10 units, according to the company. It also said IBM Credit Corp. term lease rates start at $817/mo for the tape drive unit and $1,240 for the controller. The minimum maintenance charge is $225/mo for the drive and $360 for the controller. Monthly rental charges are $2,380 for the drive and $3,690 for the control unit.

The company added that the 3420 models 4, 6 and 8 will continue to be sold. More information on the 3480 is available from the IBM National Accounts Division, 1133 Westchester Ave., White Plains, N.Y. 10604 or the IBM National Marketing Division, P.O. Box 2150, Atlanta, Ga. 30055.



Electronic Spread Sheet for VM/CMS & MVS/TSO
- Not Just Another CALC -

Powerful - Spreadsheet size is limited only by available virtual storage. ESS easily handles spreadsheets with thousands of rows and/or columns.

Proven - Already in use at over 100 installations.

Compatible - ESS accepts the same commands as VisiCorp's VisiCalc® program for microcomputers. A person familiar with VisiCalc® can be using ESS productively in minutes. In addition, ESS can load and save files in VisiCalc® format.

High Performance - Assembler language code and sophisticated storage management techniques give you fast response, even with very large spreadsheets.

Easy to Install - Just load the ESS program. No additional program products or languages are required.

Cost Effective - ESS gives all your users access to personal computing capabilities for just $220 per month. Compare that to the cost of buying hundreds of microcomputers.

Questions? - For more information about ESS, or to arrange a 30-day free trial, call or write TRAX.

TRAX

TRAX Softworks, Inc.
16501 National Blvd., Suite 205
Los Angeles, CA 90064
(213) 475-8729

AT&T from page 1

admitted in a session at the recent Interface '84 conference that the company is "having trouble getting [DDS and private-line] orders completed." Barr said that AT&T has assigned a full-time line vice-president to resolve this conflict and has written him a blank check.

The problem, it seems, is that today at least three companies are involved in the installation of a DDS circuit. An order is placed and processed by AT&T Communications, which provides the long-distance portion of the service.

The local circuit is installed and maintained by the local telephone company, which also provides a fancy jack called a Customer Service Unit. And the Digital Service Unit (DSU), an interface device, can be procured from a number of companies, including nonregulated AT&T Information Systems, Inc.

If you can find all the necessary pieces, you then have to orchestrate the installation. This is no mean feat, Clarke said, considering that AT&T Information Systems will not even take an order for a DSU (which may take 50 to 60 days to receive), let alone install one, until the DDS line has been run out to the customer's premises.

In related experiences, Clarke said he has been quoted waiting periods of four to six months for 56K bit/sec DDS links, and in January he tried to order a 1.54M bit/sec T1 circuit from AT&T. "After the AT&T person stopped giggling, he told me that they couldn't deliver a T1 prior to the third quarter of 1984."

Clarke classifies himself as a small to intermediate-size user and wonders if his experiences are typical of the class of service other users his size are experiencing.

CORRECTIONS

In "Despite late entry into 3380 market, Amdahl competitive" [CW, March 12], Bob Williams, Storage Technology Corp.'s (STC) division vice-president for I/O products, was quoted as saying that STC has installed about 100 IBM 3380-compatible disk drives.

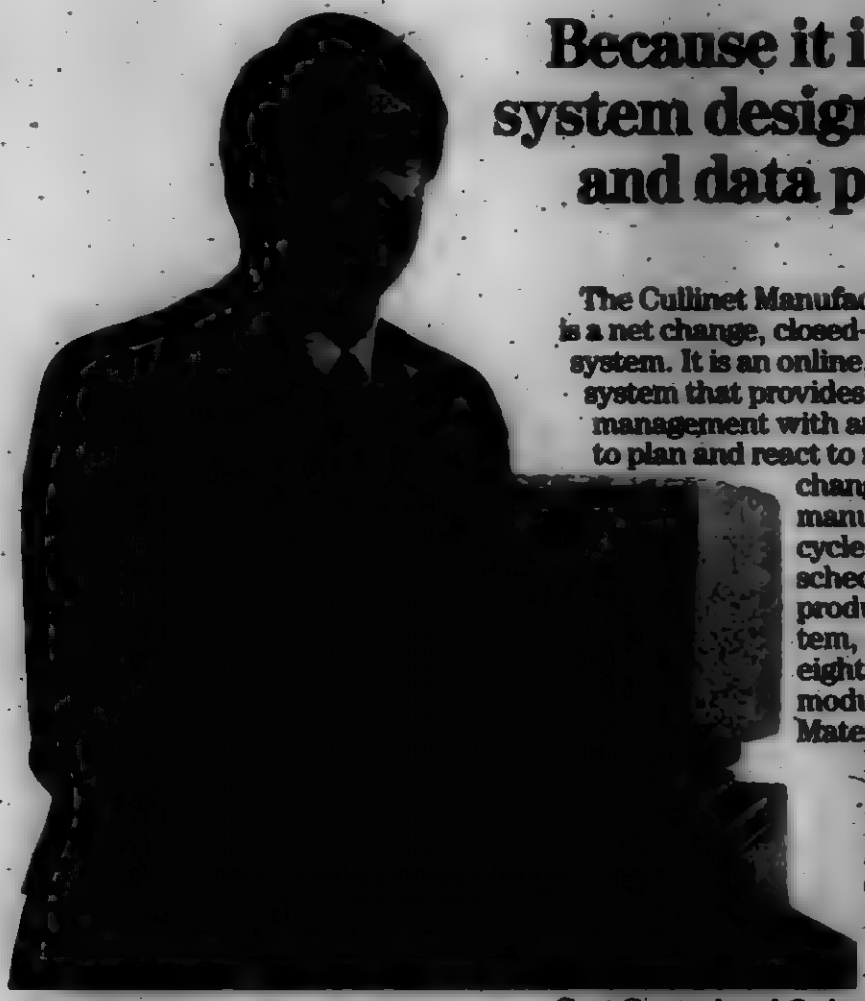
While the firm admits it has 3380-look-alike drives installed in about 100 sites, a spokesman said most sites typically have more than one drive; therefore, it has several hundred 3380-type units installed. The spokesman did not, however, state exactly how many.

A photograph in the Jan. 23 Systems and Peripherals section was incorrectly labeled as the Unidot Systems, Inc. Cerebra system. The depicted product was the Unitronix Corp. System 4000.

An announcement in the Jan. 23 Microcomputers section, "Winchester Systems, Inc., Datasafe-8; MDS-256," incorrectly identified the MDS-800 microprocessor development system as a product of Mohawk Data Sciences Corp. The microprocessor is an Intel Corp. product.

"The Cullinet Manufacturing System is a major advance in application software technology."

—Fred Buckley*



Because it is the first manufacturing system designed for both manufacturing and data processing professionals.

The Cullinet Manufacturing System is a net change, closed-loop MRP II system. It is an online, interactive system that provides manufacturing management with an effective way to plan and react to real world changes in the manufacturing cycle, from master schedule to finished product. The system, which includes eight functional modules: Bill of Materials, Material Requirements Planning, Inventory, Shop Floor Control, Master Production Scheduling, Purchasing, Cost Control and Order Entry, provides a new level of control that can dramatically increase productivity.

This level of control is made possible through the Cullinet Manufacturing System's unique horizontal and vertical integration with Cullinet's Database Software.

Horizontal integration means that all manufacturing data is controlled and accessed directly from Cullinet's IDMS/R database management system. For example, when you issue material from inventory, the system automatically updates inventory balances, allocates the quantities to Shop Floor Control and converts the units to dollars for Cost Control. Additionally General Ledger Accounts are updated because the Cullinet Manufacturing System is completely integrated with Cullinet's Financial System.

Vertical integration means that the manufacturing system is designed and developed using IDMS/R and ADS/OnLine, Cullinet's fourth generation programming productivity tool. This unique architecture provides data processing with the means to tailor and modify the system. Since you don't want to change your business to match the features of a software package, Cullinet provides the tools to tailor the manufacturing system to meet your company's requirements.

The combination of horizontal and vertical integration means, for the first time, a manufacturing system is available that meets the requirements of both data processing and manufacturing management.

Attend a productive seminar explaining this integrated manufacturing system. To participate in one of the 700 Cullinet seminars scheduled internationally, send in the coupon or call 1-800-225-9930. In MA, 617-329-7700.

**Fred Buckley is Cullinet's Manager of Manufacturing Applications Software Development. His efforts have been crucial in achieving the integration that makes Cullinet's manufacturing system unique. Fred joined Cullinet in 1977. Fred holds a degree in Computer Science from Thames Valley State and is a member of the American Production and Inventory Control Society.*

User tells what it takes to start area users group

CW AT SUGI '84

By Paul Gillin
CW Staff

HOLLYWOOD BEACH, Fla. — Some people are leaders and some people are followers, but when it comes to starting a users group, it's probably up to you to take the lead.

Speaking at the SAS Institute, Inc. Users Group International (Sugi '84) conference here last week, a member of an SAS users group in Hartford, Conn., outlined some of the factors that need to be considered in starting a regional users group.

Jim C. Knoop of Aetna Life and Casualty Co. in Hartford said creating a users group requires a substantial investment of time and some careful planning. The three most critical actions to initiate up front include assessing the feasibility of a regional users group, contacting potential members and preparing for the first meeting.

In assessing feasibility, Knoop said, it is first important to confirm that no duplication of effort is involved. Contact the vendor company directly to find out if any users groups are in the area or are already in the planning phase, he suggested.

It is also important to determine that there are enough users in the area to make a group feasible, he added.

If the opportunity is there, you must decide whether you have the time and resources to commit to the start-up effort, he noted. "There's a tendency to just wait for something like this to happen," he said. "Just face the fact that you have to start the group."

CW photo by P. Gillin

Knoop

The basic resources you need are time, a commitment both from management and yourself, a fixed mailing address and telephone number and resources to handle the postage costs, he said. The best method is to talk to your direct manager to get approval for the formation effort. Trying to obtain commitment at the corporate level can quickly kill the idea.

Start by sending a notice to vendor publications informing them of the effort. Include a list of the specific topics you would like the group to cover. Also contact the vendor for a list of local installations. "Many companies have users in a variety of departments who don't even know about each other," he said.

You will probably have to provide your own facilities for the first meeting, Knoop said. The best time for a meeting is generally in the mid-afternoon in the middle of the week. Announcements mailed to local users should inform them of the time and date, directions, parking instructions, agenda and response information. Provide space for potential members to list the products they use, their interests and proficiency and their expectations of what functions a users group should embody, Knoop suggested. "The importance of this is that you don't get bogged down in a lot of housekeeping at the first meeting, and you have a chance to focus on the topics people want to cover."

Don't set your sights too high at the first meeting either, Knoop advised. "When push comes to shove, the only thing you really have to do is schedule the next meeting," he noted. "Try to define the next presentations, select topics and speakers." To keep participation active, try to schedule another company's site for the second session.

Be prepared to give the first presentation yourself, but make an effort at the first meeting to assign the second presentation to someone else within the group. The key is to provide direction and leadership, but also to stress the participation of other members in group activities, he said.

Over the first few meetings, ground rules should be laid down for frequency, length of meetings and time, he said. Decide whether the structure is going to be formal or casual. And determine whether your group should be oriented toward a broad range of products or toward specific topics.

Leadership should be ad hoc, with volunteers taking on as much of the leadership role as possible and rotating assignments between them.

Try to mix future sessions between panel discussions, seminars and traditional lecture formats to keep members interested. And don't forget the importance of social events, he said. "One of the biggest responses in the Hartford area was toward meeting other people," he said. "Try to mix things up. It sounds childish, but try to get people to sit next to [people they don't know] at meetings."

Expenses can be handled through corporate contributions in kind, "pay-as-you-go" meetings or even revenue-generating measures such as seminars for other users. You should also look into the possibility of pursuing joint ventures with other area users groups, he said.

The Conquest of Out of Space
VSAM-TUNE
Takes Up Space Mining
Files Its Claim in Disk Wasteland

VSAM-TUNE discovers space where no more is supposed to be. Here and there. Among randomly accessed files excessively fragmented in the sophisticated but much maligned VSAM Concept.

MANAGING SPACE RECOVERY- Macro 4's name for mining waste disk space successfully—is highly productive. RECOVERING up to 60% in individual clusters, 30% across the system.

OTHER RECOVERIES. I/O activity now minimized on VSAM files for gain in job throughput. Increased VSAM file buffering for optimized available storage. Improved processing throughput. System generates six intelligible, flexible Cluster Reports. And continuous file performance monitoring—actual and projected. And much more.

VSAM-TUNE Puts the User in Control of the System

No Obligation VSAM-TUNE Evaluation

You, too, can Conquer Out of Space in your VSAM System with VSAM-TUNE. For a no obligation evaluation, call 800-223-0414. Or clip your business card to a copy of this ad and send it to:

macro 4 inc.

Wang chief decries adversarial vendor-user relations

By John Riesbeck
CW Washington Bureau

WASHINGTON, D.C. — Wang Laboratories, Inc. President John F. Cunningham told an office automation conference here last week that an adversary relationship between vendors and users of office systems is inhibiting technological innovation and worker productivity.

Delivering the keynote address at the annual Federal Office Systems Expo (Fose '84) here last Tuesday, Cunningham said a trend toward cooperation among vendors in support of systems standards and compatibility is fueling "the move from a vendor-driven market to one where users really influence the vendor's products and services."

Focusing on a theme that mirrors Wang's technological and business strategies, Cunningham said the key to innovation in office systems is compatibility. "Serving the end user means compatibility, because [that] will mean survival and growth."

According to the Wang executive, "user-driven trends" show that "major opportunities will go to those vendors who support the levels of compatibility and standards required by large organizations. We have a long way to go before compatibility becomes more than the lowest common denominator of vendor features ... but we have made progress."

Pointing to accelerated acquisitions and mergers, joint ventures to develop and market new products and "the move to agree on de facto standards," Cunningham said vendors realize that if they want to sell to more than just niche markets, closer relationships between firms "will be necessary in order to compete in a new and huge marketplace." As to the products themselves, Cunningham commented that "R&D departments everywhere are humming.

"The whole objective of specialized communications and truly integrated office systems," he said, "is to make good finally on the claim that the system must support the individual user the way the user wants to be supported — at the desktop level."

This "vision of the office," he continued, "has a lot in common with a larger cultural trend toward more local autonomy — not at the cost of weakened central authority, but with the help of better centralized standards." Toward that goal, "we have to break all traces of a vendor-user adversary relationship if we're going to regain our leadership as a nation in the worldwide economy."

Former SDC consultant pleads guilty in Mass. contract case

By Patricia Keefe
CW Staff

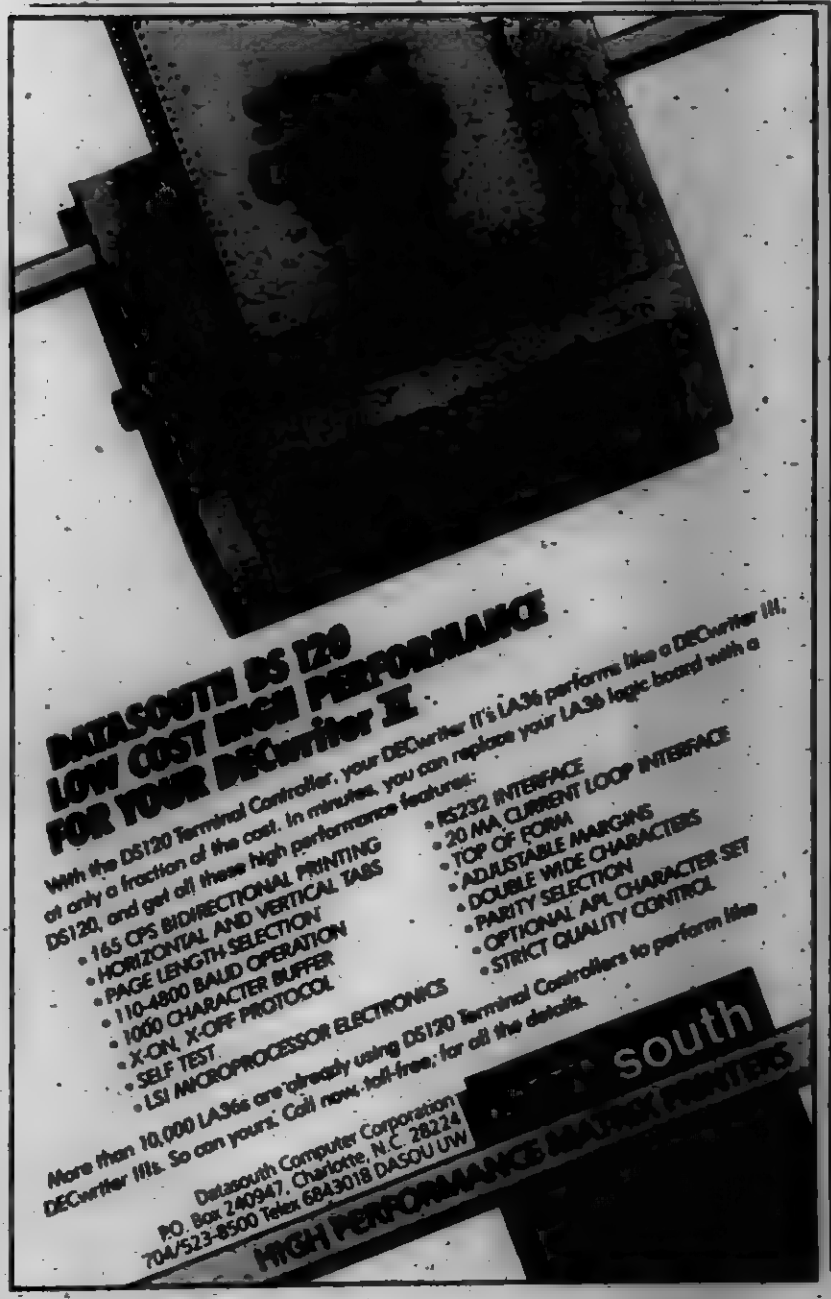
ALEXANDRIA, Va. — A former marketing director and consultant for System Development Corp. (SDC) last week pleaded guilty to charges of wire fraud, bribery and income tax evasion stemming from three separate incidents. As a result, M. James Errico faces up to 21 years in prison and fines of up to $31,000.

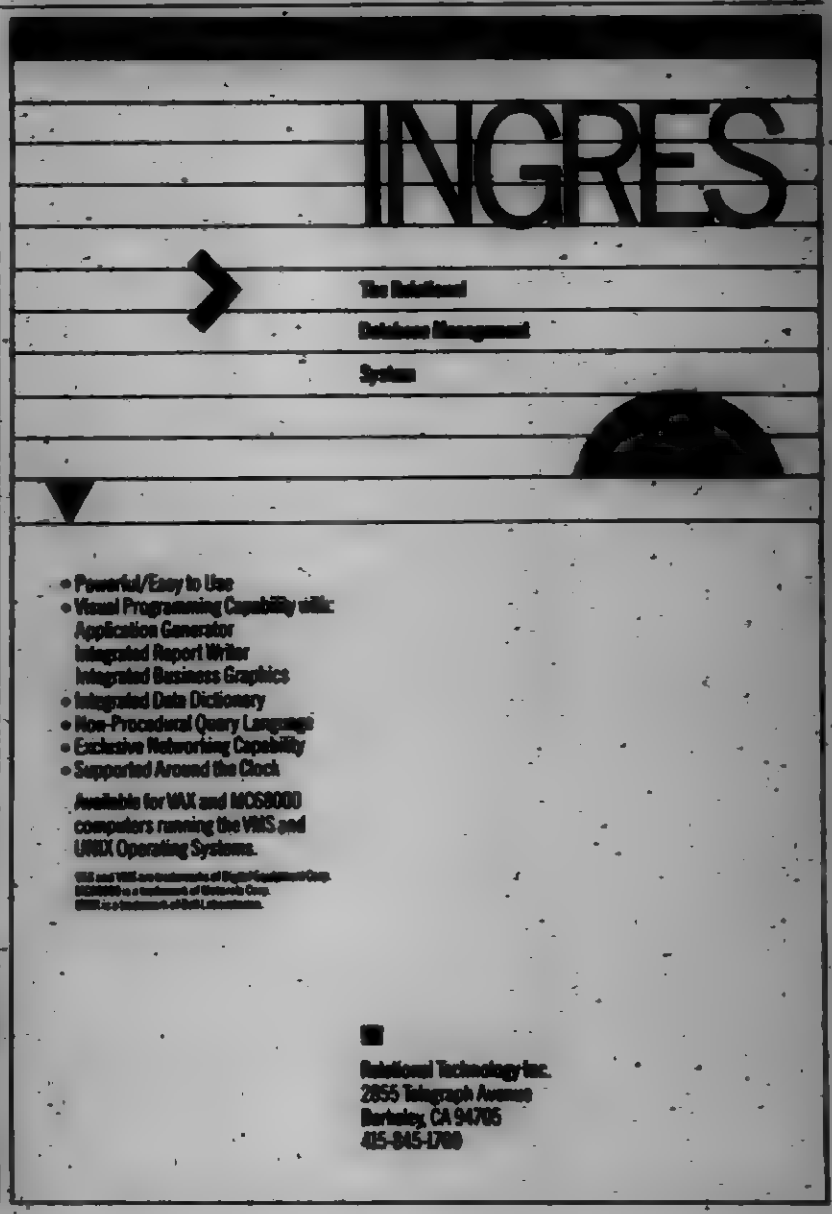
Errico avoided trial by pleading guilty and will be sentenced April 19. He was indicted last month on two counts of wire fraud, attempted bribery and interstate travel in aid of racketeering in connection with efforts to influence the award of a $3.4 million Massachusetts state contract. Errico was accused of promising a consultant hired by the state Welfare Department with future SDC consulting work in exchange for helping to have the programming contract awarded to SDC [CW, Feb. 20].

SDC is currently developing for Massachusetts a Medicaid Management Information System (MMIS), which is expected to undergo review for federal certification in June. Although the development contract has been plagued by delays and threats of cancellation, Welfare Commissioner Charles Atkins recently expressed satisfaction with SDC's performance.

However, a provision in the MMIS contract would allow the state to fire SDC if Errico were to be convicted. Attempts to reach state Welfare officials at press time to determine the impact of Errico's guilty plea were unsuccessful.

Errico also pleaded guilty to bribery in a separate case involving the Department of Energy (DOE) between 1980 and 1981, after authorities investigating the Massachusetts bribery scheme turned up other facts concerning payments made to a DOE employee in exchange for a kickback on another federal contract. As a result of other information, Errico also pleaded guilty to charges of failing to file a personal income tax in 1978.





NTIA backs former BOCs on FCC conversion restrictions

By Phil Hirsch
CW Washington Bureau

WASHINGTON, D.C. — The recently divested Bell operating companies gained powerful support this month in their efforts to get out from under the restrictions imposed by the Federal Communications Commission's Second Computer Inquiry decision.

The FCC modified some conversion restrictions last November, but left two key provisions intact. As a result, beginning June 30 the local operating companies will have to form separate subsidiaries if they wish to market enhanced products and services, and they will have to obtain a commission waiver before performing end-to-end protocol/code conversion directly. Earlier this month, the National Telecommunications and Information Administration (NTIA) — the president's chief telecommunications adviser — supported requests from several local operating companies seeking to eliminate the protocol/code conversion restriction.

FCC reconsideration of this ruling is "especially important," the NTIA said, because "provision of such functions at the telephone company's central office may be essential to promote wider availability of . . . information retrieval, electronic banking and computer communication services. With the greatly increasing popularity of word processors, personal computers and other low-cost data processing units, the number of potential users of enhanced services and sophisticated [customer premises equipment] is expanding rapidly."

The counterargument is that if the local operating companies are allowed to provide end-to-end protocol/code conversion directly, they will gain an unfair advantage over their competitors. As the Computer and Communications Industry Association put it in comments filed March 12, the local operating companies' "regional coordination through regional holding companies and their national coordination through [Bell Communications Research, Inc., formerly the Central Services Organization] is ample evidence of broad-based control of bottleneck facilities."

This argument over Computer Decision II's application to the local operating companies comes at a time when several of the companies are reportedly planning to implement nbw "smart network" services.

For example, officials of Bell South, one of the seven regional holding companies created by the breakup of the Bell System, confirmed that the company plans to file a tariff within the next few months covering a packet-switched service called Pulsecom.

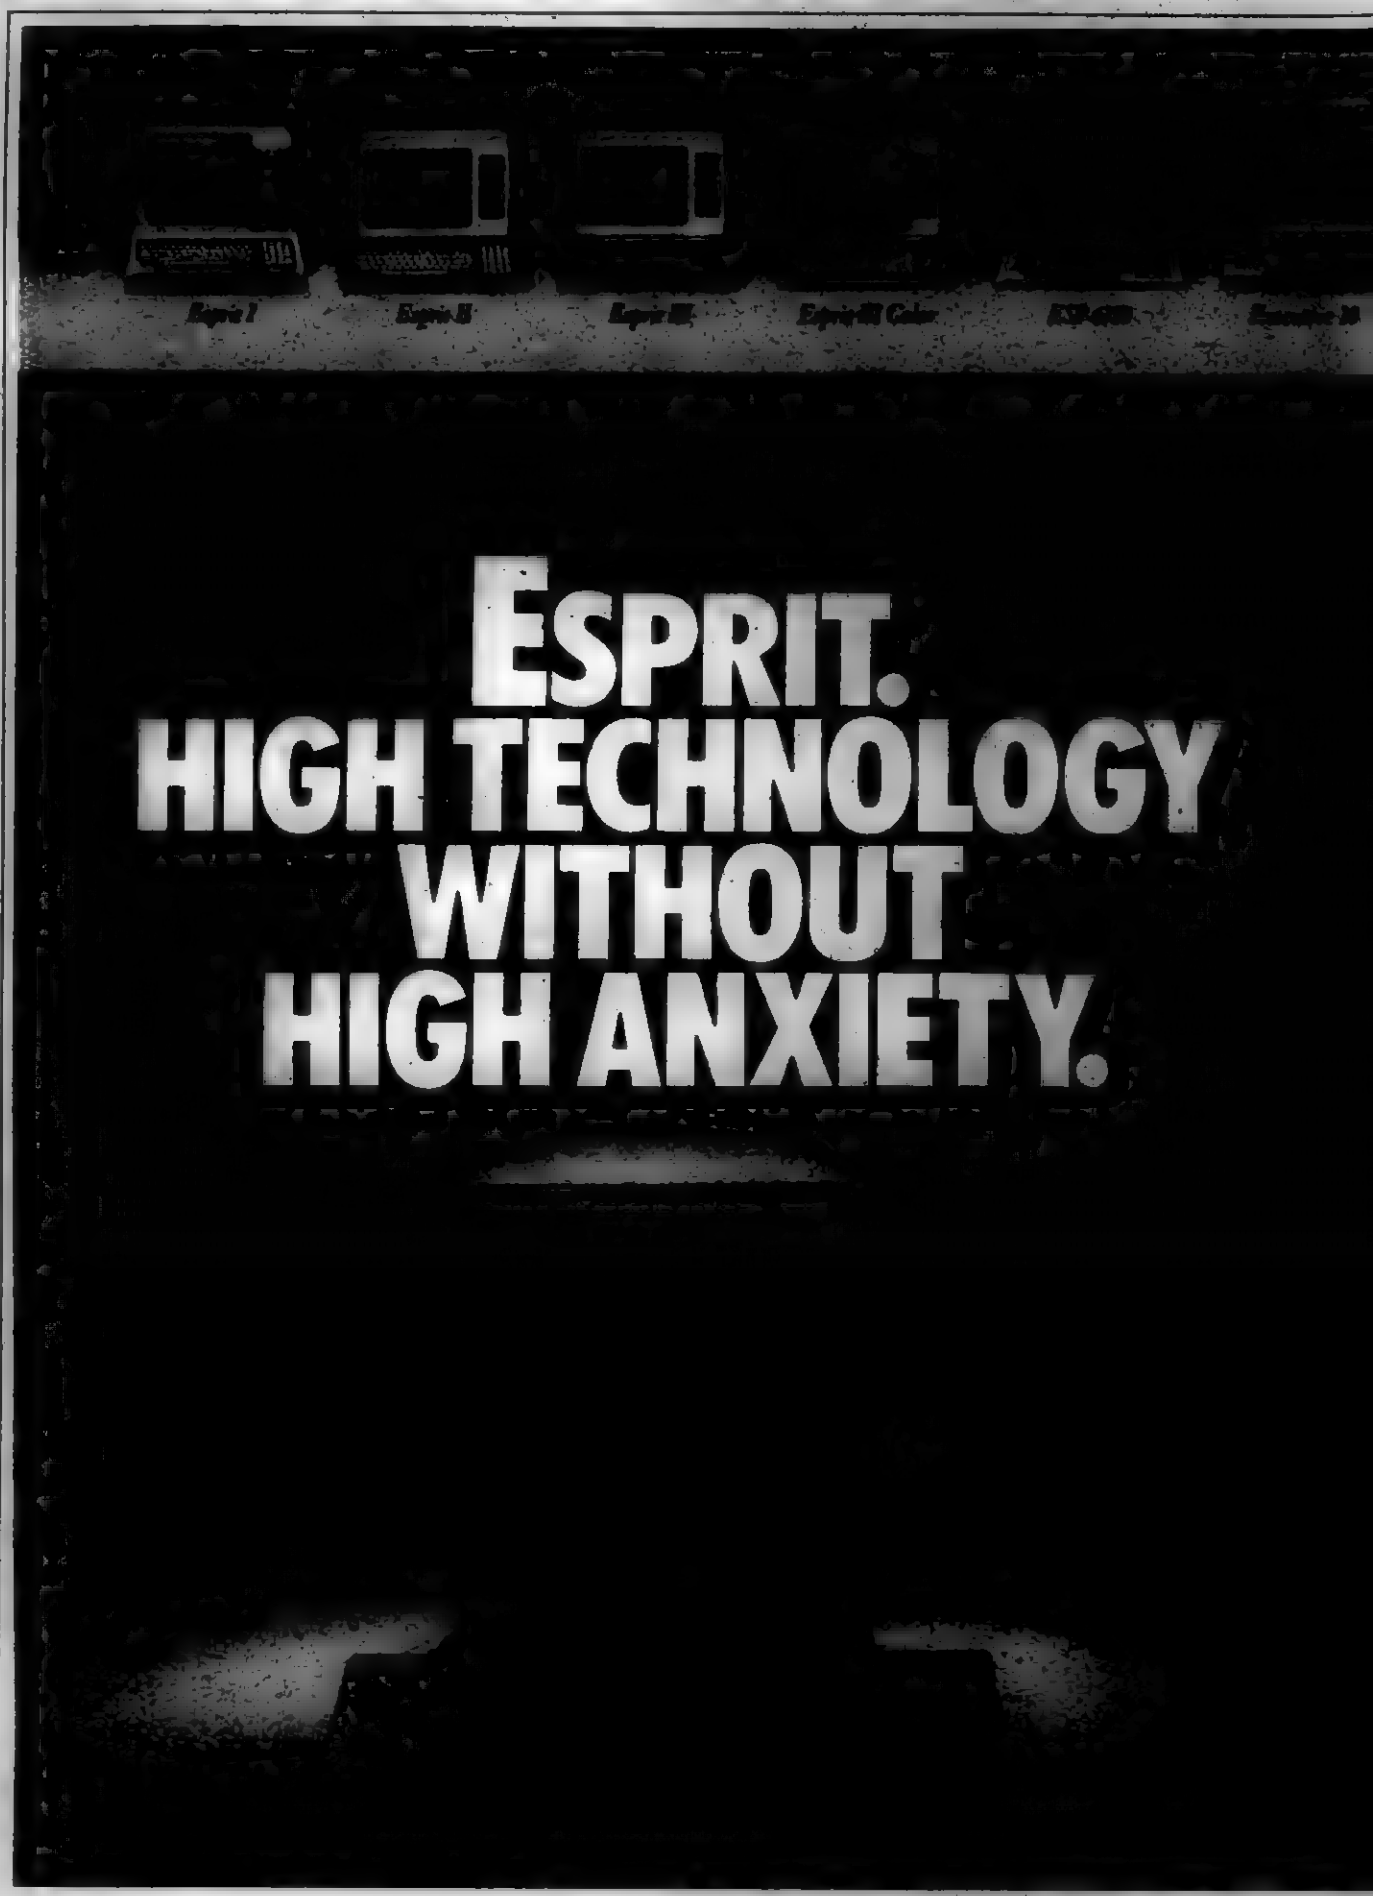
Mumps sets June meet

PHILADELPHIA — The Mumps Users Group will hold its annual conference June 4-8 at the Adam's Mark Hotel here. On the agenda are presentations, tutorials, workshops and round table discussions focusing on implementations, new technology and applications of the Mumps language.

For nonprogrammers, there will be introductory seminars on Mumps programming.

The $150 registration fee includes a one-year individual membership in the Mumps Users Group, as well as admission to technical sessions, round table discussions, the exhibit hall and social activities. Each full-day tutorial costs $120.

More information is available from the Mumps Users Group, Suite 306, 4321 Hartwick Road, College Park, Md. 20740.



Cbema: U.S. might retaliate if Japan OKs software plan

Controversial copyright protection proposal fires industry, government responses

By John Gantner
CW Washington Bureau

WASHINGTON, D.C. — Computer industry representatives last week said the U.S. government is exploring ways to retaliate against Japan if it proceeds with legislation that American vendors say will greatly reduce software protection in that country.

The U.S. Congress could retaliate by stripping Japanese vendors of all copyright protection for computer programs as well as for operating systems and firmware of products sold in this country, according to Oliver Smoot, executive vice-president of the Computer and Business Equipment Manufacturers Association (Cbema).

This reaction is permissible, Smoot said, under the terms of the Universal Copyright Convention, to which both the U.S. and Japan are signatories. He indicated that Cbema has been in contact with attorneys in the U.S. Patent Office and in the trade agencies who are working on specific legislative language that Congress would need to institute the retaliatory measure.

Smoot and Cbema President Vico Henriques told a press conference here last Monday that the action could be taken if the Japanese Ministry of Trade and Industry (Miti) goes ahead with a plan to recommend a new Japanese legal structure for software protection. The Miti proposal would replace copyright protection with a new law reducing protection to only 15 years and giving the ministry authority to mandate compulsory licensing of foreign software to Japanese end users in certain cases.

Miti has until March 27 to propose legislation if it wants the matter considered during the current session of the Japanese parliament. U.S. trade officials have been negotiating with their Japanese counterparts to kill the plan. The Cbema press conference was called to support the government efforts, according to Henriques, who said Miti "evidently thinks we aren't serious in our opposition" to the proposal.

Cbema has contacted similar associations in six European countries and in Australia and New Zealand. "The consensus is that copyright is clearly the way" to protect software, he said. He suggested that if Miti goes ahead with its proposal, Japanese vendors could face retaliation in a number of markets.

The copyright convention would allow the U.S. to pass a law offering copyright protection to Japanese vendors equivalent to that afforded U.S. firms in Japan. In other words, Smoot said, if Japan eliminates software copyrights for a new type of protection, the U.S. could also eliminate copyright protection and not replace it with a new law, leaving Japanese firms with no general system of software protection.

Although the Japanese do not have a large share of the U.S. software market, the elimination of copyright protection could also affect proprietary operating systems and control sequences embedded in read-only memories, according to Smoot. This would affect a great amount of Japanese-made hardware.

Because the U.S. industry has been working on this issue in close cooperation with high-level administration officials, including Vice-President George Bush, Commerce Secretary Malcolm Baldridge, U.S. Trade Representative William E. Brock and the staffs of relevant Senate and House committees, Henriques said Cbema is confident of "very strong support" for retaliation against Japan if the Miti proposal goes forward.

Nowadays, technology is advancing so rapidly that today's latest breakthrough may be replaced as soon as tomorrow by something even more revolutionary.

As this ever-changing technology becomes more and more available, it becomes more and more confusing to choose the precise technology to suit a particular need. All of which makes it difficult for the human mind, which is not programmed to adjust to change quite that quickly, to cope.

INTRODUCING PEACE OF MIND.

That's why Esprit would like to introduce a new concept that can make it easier to cope with this rapidly-changing world: the peace of mind that can give you high technology without high anxiety.

And back it with an extensive nationwide service network and our own special toll-free number (800-645-4508) so you can reach us about anything that might disturb that peace of mind.

Designed right into every terminal in Esprit's complete line are the features, the functions and the flexibility that make it not only user-friendly but systems-friendly. In other words, the kind of comfort, quality and trouble-free technology that can provide real peace of mind.

PEACE OF MIND FOR THE NEXT GENERATION IN TERMINALS.

One look at the Esprit ESP 6310 and you'll recognize the next generation of terminals. With performance and features far superior to other terminals in its price category. And the kind of quality you can feel comfortable with.

DESIGNED FOR PEACE OF MIND.

From the sleek and stylish lines of its ergonomic design, to the familiar sculptured lines of its low-profile keyboard with its 11 user-programmable function keys—shiftable to 22—in non-volatile memory back-up, that can be programmed directly or downline-loaded from the host computer.

From its high resolution, green phosphor display with a well defined character font, in a large 7 x 11 dot matrix, in an 80 column x 25 line format to its screen-saver feature which deactivates the screen after 20 minutes of inactivity.

From its tilt and swivel monitor to its smooth scrolling and line graphics capabilities.

PEACE OF MIND PRICE. $695.

Our ESP 6310 provides enhanced performance and incorporates emulations of the TeleVideo 925/910 PLUS*, ADDS Regent 25/Viewpoint* and Lear Siegler ADM3A*, as well as the popular Esprit series.

But at $695, it's priced below many far-less featured terminals. That means even our low price is designed to prevent high anxiety.

Threats greater than hacking seen facing micro users

By Paul Kenaniowski
CW Staff

NEW YORK — While hackers and white-collar criminals have been portrayed as the principal threats to data security, they do not represent the chief concern of one manager responsible for managing microcomputer growth.

"Look at the statistics concerning data lost from power fluctuations," said William O'Neil, director of microcomputing at The First Boston Capital Group, Inc. in Tarrytown, N.Y. "Most of our time is spent recovering data lost from an electric problem."

O'Neil and five other panelists — representing Hewlett-Packard Co., 3Com Corp., Tallgrass Technologies Corp., the "Seybold Report on Professional Computing" and Archive Corp. — participated in "Data Security Issues in Microcomputer Applications," a round table sponsored here last week by Tallgrass.

The swift growth of hard disk systems, a rapid change in the type of workers using computers, a lack of vendor-provided education and hard-to-use software have left many microcomputer users with disasters waiting to happen, the panelists agreed.

"It usually takes a catastrophe before a user understands the importance of adequate backup," industry analyst Andrew Seybold claimed.

"If one formats an IBM Personal Computer XT and does not indicate which drive to format, the machine formats the hard disk and wipes out all data on it," Seybold noted.

'Education is the key. Users have to realize there is a problem before they will address it.'
— industry analyst Andrew Seybold.

The problem of inadequate backup will increase as microcomputers use sophisticated operating systems, such as Unix; as corporations store data on microcomputers; as Winchester disk storage capacity increases; and as less sophisticated workers use microcomputers, the panelists said.

"The situation will become much worse in the future," Frank P. Carau, HP research and development section manager, warned.

But vendors are ignoring the problem, panelists added. "I would like to see one commercial with Charlie Chaplin loading and unloading 10 diskettes to back up the hard disk records of the Little Hat Co.," O'Neil stated.

"IBM is setting microcomputer standards and has a responsibility to address the problem of backup procedures for microcomputers," O'Neil said.

Panelists advocated educating users, developing software with simple backup procedures, incorporating backup capabilities in hardware and establishing simple corporate backup procedures.

"Education is the key," Seybold maintained. "Users have to realize there is a problem before they will address it."

Retailers and corporate microcomputer support groups, as well as vendors, have to educate users. "We are finding more retailers including backup equipment in the system sale," David Allen, president of Tallgrass, said.

Current backup software procedures are hard to use. "A user will not sit and swap 10 disks," Bill Krause, president of 3Com, said. "Backup is not the principal benefit; a simple-to-use restore function would be. Currently, that feature is not available."

Microcomputer software should include features from mainframe software, according to O'Neil. "Microcomputer software should always include audit trail reports," he said. "Knowing who was the last person to use a package and what changes he made is vital in any large company."

Hardware today offers inadequate backup facilities. "The floppy disk will become the punch card of the 1980s," Krause predicted.

Hardware should incorporate sophisticated backup facilities. "We must begin to view a backup device as peripheral to a peripheral, the disk drive," M. Thomas Makmann, president of Archive, said. Optical disks, tape cartridges and removable Winchester disks were mentioned as some possible solutions to the problem.

Corporate planning is needed. "Backup procedures are a way of life with mainframe users," Seybold said, "but there are few mainframe users with any type of microcomputer backup procedures."

To succeed, plans must be simple. "Mark one tape 'Tuesday, Thursday, Saturday,' the other 'Monday, Wednesday, Friday,'" Allen recommended. "Then assign an employee to collect the tapes every night."

Once these policies and enhancements are in place, microcomputers can help protect data, according to O'Neil. "Microcomputers can be used to check the way a user logs on," he said. "If a procedure does not match a user's normal pattern, he will be denied access to the system. The microcomputer can be used to secure mainframe data."

"We're saving $50,000 a year by eliminating SYSOUT printouts and installing JCLWTR."

That's the word from one user of AID's new JCLWTR system.

Instead of printing every production SYSOUT listing, JCLWTR stores them on disk where they're instantly accessible through special SPF screens or hard copy printouts.

The savings in paper, printing, handling, and storage costs add up so quickly that even medium and small shops can recover the system's minimal cost in just months.

JCLWTR installs on medium and large IBM systems operating under MVS and supports on-line interfaces to COM.

Find out how much you can save with AID's JCLWTR system. Send in the coupon, or call Lew Kabza at 312/654-3030.

Vision systems still in infancy but promising

PRODUCT SPOTLIGHT

By Tom Henkel
CW Staff

Perhaps the least understood aspects of artificial intelligence are two functions that many humans take for granted: seeing and hearing. Humans rarely think about their ability to recognize a familiar face or voice; it is all done automatically by the brain, which can compensate for major differences in the way information is received and processed.

For developers of artificial intelligence systems, the ambiguity involved in human hearing and vision causes monumental problems. While humans can easily adapt to changes in their environment, machines cannot.

Researchers agree that both vision recognition and voice recognition machines are in their infancy. Of the two, however, vision systems appear to have experienced greater success. Optical character recognition (OCR) systems, such as those that can read bar codes and specialized type, have been around for some time. Lately, companies like Kurzweil Computer Products, Inc. of Cambridge, Mass., have improved basic OCR technology by adding artificial intelligence features to OCR readers. With the help of an operator, Kurzweil's 4000 machine, for example, can learn new typefaces.

Vision systems have also recently gained popularity as stand-alone factory floor devices performing functions like inspection, robot vision and gauging.

More than 75 companies currently offer vision systems. Many of these vendors have appeared over the past year, according to Howard Dicken, president of DM Data, Inc., a Scottsdale, Ariz., technology research firm.

Only a handful of vendors is competing in the speech recognition market. The reason is that it is much easier to understand how the human eye works than how the human ear works, said Dr. Robert J. Shillman, president of Cognex Corp., a vision recognition firm in Needham, Mass. Shillman explained that cameras can be set up to analyze an object in much the same way humans do.

Typically, that analysis takes one of two forms: The camera can be trained on a fairly large area, called an area array, or it can be set to view a slice of the overall picture, called a linear array. The latter approach can be especially useful in situations where the vision system is recording numbers, labels or some specialized codes.

Compared with the human eye, however, vision systems are far from complex. "Understanding human perception is a very difficult task," Shillman said, adding that the more complex the application, the more difficult it is to develop a vision system to handle it.

So why use a vision system? Dr. Philippe Brou, a research scientist at MIT's Artificial Intelligence Laboratory in Cambridge, pointed out that vision systems can perform many simple, extremely boring factory jobs, such as inspection tasks. And sometimes, they can perform these tasks better than humans. Machines do not get bored, nor do they suffer from personal problems or illnesses, which can affect the quality of a human's work. Moreover, for highly technical applications such as determining whether a metal object is flat, vision systems can be far more accurate than the human eye, Brou noted.

Why use a vision system? Dr. Philippe Brou, a research scientist at MIT's Artificial Intelligence Laboratory in Cambridge, pointed out that vision systems can perform many simple, extremely boring factory jobs, such as inspection tasks. And sometimes, they can perform these tasks better than humans. Machines do not get bored, nor do they suffer from personal problems or illnesses, which can affect the quality of a human's work. Moreover, for highly technical applications such as determining whether a metal object is flat, vision systems can be far more accurate than the human eye.

Presently, however, vision systems are so simplistic that it is sometimes more efficient to have a human performing the job, Brou admitted. First, humans can adapt to changes in their environment almost instantly; machines have to be retrained. Secondly, humans can perform many functions at once, some of which have been learned through experience rather than special training.

It is not surprising, Brou said, that many of the currently available vision systems cost in the $30,000 to $50,000 range. In applications where the complexity of a vision system would require a product costing more than about $50,000, the MIT researcher said, it is often more economical to hire humans to perform the job.

Big problem

One of the big problems with vision systems is that virtually all those that are commercially available are based on the same two-dimensional technology. Most were designed around a set of algorithms developed at the Stanford Research Institute in Menlo Park, Calif.

According to Brou, this approach involves using a video camera to take a picture of an object, typically in black and white. The object is then digitized, and the image is converted into a series of binary signals. The signals indicate whether a given space in the camera's view should be black or white. From there, the vision system's central processor can reassemble the digitized signals to form an image.

Some firms have developed a variation on that two-dimensional theme, adding the ability to recognize various shades of gray in addition to black and white.

While Brou was quick to point out that two-dimensional systems are ideal for some applications, he said they are not very useful for others. He cited as an example a quality control application on a factory floor. A two-dimensional system may be fine to determine whether holes have been drilled in the proper places in a given object; the object, typically moving on a conveyer belt, would pass between a camera and a light source. The light would pass through the drilled holes and would result in white spaces against the black backdrop of the item.

But this approach is effective only if the holes were drilled all the way through the object. If the application involves testing to see whether holes have been drilled deeply enough into an object, the two-dimensional system would be of little help, because it could not perceive depth.

Much of the research currently under way at MIT involves the development of vision systems that can perceive depth. This research may someday help overcome some of the problems presented by commercially available vision systems, Brou said, because it could result in vision machines which would distinguish among different, overlapped parts.

Brou said several techniques to accomplish this are currently being investigated. Some use dual cameras, which view an object from different angles, but this process tends to be slow.

Cognex's Shillman said many commercially available vision systems offer the ability to link to larger computer systems; many, for example, offer RS-232 ports. Brou, on the other hand, said that most vendors of vision recognition systems have made only minor attempts at linking vision systems to corporate mainframes, mainly because few users have demanded it.

What the future holds

What does the future hold for vision systems? According to DM Data's Dicken, vision systems will undoubtedly become more sophisticated, and more vendors will hop into the market.

Dicken predicted that the vision market, which chalked up about $30 million in sales during 1983, will jump to around $760 million by 1990. While the growth in the vision market is expected to be dramatic, Dicken pointed out that other areas of artificial intelligence will be even hotter.

For example, natural language software, which finished off 1983 with about $8 million in total sales, will jump to a $920 million market by 1990, according to Dicken.

Top 10 visual recognition firms based on 1983 sales

Firm Name	Type of System Manufactured	Price Range	Estimated 1983 Sales Revenue
AUTOMATIX 1000 Technology Park Dr. Billerica, Mass. 01821	Robotic and artificial vision systems	$30,000-$80,000	$5 Million
EVERETT/CHARLES AUTOMATION SYSTEMS, INC. 700 E. Harrison Ave. Pomona, Calif. 91767	Robotic and machine vision systems	$25,000-$75,000	$4 Million
ROBOTIC VISION SYSTEMS, INC. 536 Broadhollow Rd. Melville, N.Y. 11747	Visual recognition	$35,000-$25,000	$2.6 Million (Fy 1982)
OBSHEX CORP. 72 River Park St. Needham, Mass. 02194	Visual recognition	$30,000	$2 Million
GENERAL ELECTRIC INTELLIGENT VISION SYSTEMS OPERATION 300 7th North St. Liverpool, N.Y. 13088	Visual recognition	Not Available	$2 Million
MACHINE INTELLIGENCE CORP. 330 Potrero Ave. Sunnyvale, Calif. 94086	Machine vision systems Intelligent robot systems	$35,000-$75,000	$1.4 Million
PERCEPTION, INC. 23920 Freeway Park Dr. Farmington Hills, Mich. 48024	Visual recognition systems	$30,000	$1.5 Million
OMTEK, INC. 7 Corporate Place South Bedford St. Burlington, Mass. 01803	Visual inspection and recognition system	$18,000-$50,000	$1.4 Million
APPLIED INTELLIGENT SYSTEMS 110 Fieldland Plaza Ann Arbor, Mich. 48103	Visual recognition systems	$17,000-$70,000	$1.0 Million
OBJECT RECOGNITION SYSTEMS, INC. 521 Fifth Ave. New York, N.Y. 10175	Visual recognition systems	$20,000-$25,000	$1 Million

Middle managers told to adapt to changing OA roles

By [illegible]
CW Staff

BOSTON — Office automation means that many decisions traditionally made by middle managers will pass to those below them, forcing managers to change their ways or lose their jobs, attendees at a conference here were told last week.

Citing a poll that showed a trend toward more clerical jobs and fewer middle-management positions in the future, David Cirullo, who is a senior development specialist for Wang Laboratories, Inc., said, "There will be less and less reliance on gut reaction and more and more on a manager's proficiency with skills using office automation."

Cirullo, addressing the American Management Associations' Human Resource Conference, noted that middle management's traditional role has been to gather and disseminate information and to make decisions.

But in the information age, that information is being handled by clerical workers who can make many decisions. "Decision making is going to go down to the lowest level," he maintained.

This shift in responsibility means that during the next decade, clerical jobs will increase from 45% of a typical company's staff to 80%, while the share for middle managers will drop from 40% to 20%, Cirullo said, citing a recent Harris Survey.

'[illegible]'

Cirullo said preliminary results from his own survey of 300 firms indicate that 91% of middle managers consider computers "at least somewhat important" and that computers are important to their organizations.

He warned that automation means fewer management jobs, but also more responsibilities for those who remain.

To ease the transition, firms must recognize the importance of user-friendly systems, ongoing training, teleconferencing and remote management as companies shift to satellite operations away from the main office.

Another speaker at the conference, however, predicted that computers will have only a secondary impact on the middle-management work force. Eddie C. Smith, vice-president for human resources at Robbins and Myers, Inc. of Dayton, Ohio, pointed out that during the latest recession, the unemployment rate for managers was three times that of the general work force.

The influx of the post-World War II baby-boom generation has provided the work force with highly educated management candidates, Smith said.

But their desired positions are already filled by persons only about 10 years older. He said that the shortage of management openings will only be "exasperated" by cutbacks created by office automation.

Addressing the computer needs of middle managers, Lawrence F. Vogel, director of editorial services for The Office Systems Consulting Group, Inc. of Cambridge, Mass., observed that a new, younger generation of managers is more likely to welcome keyboards on its desks than are older managers.

Those younger managers are less likely to rely on secretaries to handle their word processing chores, he said.

He emphasized the need for ease of use, the ability to do work better with less effort. He then stressed the "level of flexibility," for example, the importance of giving a manager a computer tool to do a financial analysis that looks like it would on paper.

Finally, he cited the importance of a "degree of urgency," basically a negative factor that convinces a person that he needs a computer, even if it is only to produce a report on deadline.

Robots 8 meet set for June 4

DETROIT — Robots 8, an exposition and conference of robotic specialists, industrialists, engineers and manufacturing executives, is scheduled for June 4-7 at Cobo Hall here. The conference is being sponsored by Robotics International of the Society of Manufacturing Engineers (SME) and the exposition by the Robot Institute of America.

"Merging Technologies" will be the conference theme, and 80 industry experts reportedly will explain new aspects of robot implementation, applications and research.

More than 220 builders and suppliers of industrial robots, services and components are expected to exhibit, a conference spokesman said.

Advance registration for the exposition is $10. Registration for the full four-day conference is $450 for SME members and $510 for nonmembers. One-day and two-day rates also are available.

Registration forms are available from Robotics International of the SME, Box 930, Dearborn, Mich. 48121.

FEC work load growing as campaigns gear up

By Jeanne Connolly
CW Staff

WASHINGTON, D.C. — When the Reagan-Bush '84 Reelection Committee reported 76,000 political contributions worth $4.2 million, the Federal Election Commission (FEC) was left with the task of computer indexing, microfilming and reviewing the 9,000 pages of reports.

While that filing was exceptionally large, it was only one of the thousands of election-year reports that the agency must process for public and in-house review, sometimes within 48 hours.

Established in 1971 through campaign reform legislation, the FEC handles a constant flow of information requests and financial reports, even in nonelection years. But it is during a presidential election year that the work load reaches record proportions.

"The dollar volume increases and the number of transactions increases. For example, the dollar volume for a congressional election cycle will equal the numbers for the previous presidential election, and, two years later, the next presidential cycle will be even higher," said Bob Biersack, supervisor-statistician for the agency.

The FEC has a six-year, $6 million facilities management contract with National Data Corp., which operates a Digital Equipment Corp. Decsystem-10 in Fairfield, N.J. That and related contracts make up about 8% of the agency's approximately $11 million fiscal 1984 and 1985 budgets.

Raising storage capacity

The agency enters data from the reports at its headquarters here, and transmits it via four 9,600 bit/sec lines to Fairfield. Since it became active in 1975, the FEC has amassed data that has almost filled eight 176.6M-byte disk drives. Biersack said that while the agency is nearing its storage capacity, "the biggest problem with the data base is that it is so dynamic." Paul Laramee, a supervisor systems analyst, added, "Even though we run an update every night at 7:00, when a person comes in to make a request the next day, the data may already be outdated by new filings."

Those filings are expected to peak in October and November, when candidates are likely to report up to 90,000 contributions per month just to meet the commission's public disclosure requirements. In addition to those reports, the commission receives separate reports, sometimes on magnetic tape, that can be fed into the mainframe, relating to candidates' requests for matching federal funds.

In 1984, the commission will process more than 28,000 documents.

While matching-fund requests are seldom requested by the public, the agency receives constant requests for quarterly and monthly campaign reports. Those inquiries may come from opposition candidates, public interest groups, the news media and political consultants.

Federal laws require the commission to index at least the first two summary pages of financial reports and to microfilm the full reports within 48 hours of their receipt. Those financial summaries show how the candidates raised and spent their money.

After data entry clerks index the summaries, they code those pages according to the type of data reported, then they enter the names, addresses, occupations and other detailed information relating to individual contributions and campaign expenditures over $500. The data is cross-referenced by contributors, as individuals or groups and by candidate.

Laramee reported that while data entry is now performed in-house, a contract for future work is now out to bid.

Even as new reports pour into the offices, the public access staff must deal with both on-line and batch-oriented information requests. During the six months ending in March, the agency handled more than 7,000 requests for one to 20 reports on an on-line basis, as people walked in off the street or telephoned requests. "At least as many" mail or otherwise less timely requests were batch processed, and 24,000 on-line internal accesses were processed during that time, said Richard Hooper, supervisor systems analyst.

Such requests and data are entered on the agency's 86 terminals, which include DEC VT100s, Perkin-Elmer Corp. Owls and Televideo Systems, Inc. 925s. The agency also uses Eastman Kodak Co. DMT-150 microfilm reader copiers and a variety of DEC and Data 100, Inc. printers. The terminals, linked by the communications lines to the New Jersey facility, draw information from a data base managed by a Software House System 1022 data base system on the Decsystem-10.

But even with the system in place and operating well, the agency still faces an occasional monkey wrench in the form of new legislation.

Imagine,
if you could offer
Distributed Printing
without RJE!

You Can! With VPS the JES/3270 RJE report distribution package. Drive up to 2,000 3270 attached printers while you improve CRT response and reduce local and remote printing costs.

MCBA is looking for some professional bill collectors.

More specifically, we're looking for some dealers who like money. Lots of it. Because when you carry our powerful, field-proven software, that's exactly what you can expect.

Why? It's quite simple, really. The quality of MCBA's library of 17 modular manufacturing, distribution, and accounting packages is attested to by over 15,000 users worldwide. In fact, it's really the only serious software of its kind available for mini and micro environments. Thanks to its modularity and flexibility, not to mention its comprehensive documentation. All of which has helped us develop and maintain successful relationships with dealers like you for over 10 years now.

This means you can establish a relationship with us and have at your disposal a comprehensive library of software packages. All of which can be mixed or matched to suit the unique needs of your customers. And as your customers grow, they'll come back to you for more business. Because you can expand their systems with totally integrated packages that work with each other like the movement in a Swiss watch.

So no matter what size your customers are now, or what size they are tomorrow, your business keeps growing. And the bills (the green kind) keep pouring in. It might even get embarrassing.

So if you're a dealer who's in it for the money, call MCBA now at (818) 957-2900. You may not end up being famous. But you could end up rich.

MCBA®

Software that grows on you. And with you.™

2441 Honolulu Avenue, Montrose, California 91020

For HP, Wang, DEC, and TI minis and UNIX, and RM/COS-based micros.

Direct marketing group assails IRS matching plan

Direct mail lists to be used to locate tax evaders

By Paul Kennedeweld
CW Staff

The Internal Revenue Service's plan to use direct mail lists to locate tax evaders has drawn fire from the Direct Marketing Association (DMA), a coalition of 2,400 direct marketing companies.

"Those lists are designed for marketing purposes and should not be used for law-enforcement," said Jonah Gitlitz, the DMA's senior vice-president.

The DMA fears that citizens will be afraid to release information that marketing personnel need in order to target prospective customers. "If the public thinks the IRS may use the information, they will be less likely to cooperate," Gitlitz claimed in a recent interview.

By matching 1982 tax filer lists against a mailing list from Washington, D.C.-based Dunhill Co. that cost the IRS $49,000, the IRS hopes to locate 1,200 tax evaders in each of four test locations: Milwaukee, Bronx, N.Y., Nevada and Indiana [CW, Sept. 1, 1983]. Dunhill's list contains 2 million names equally divided among the four locations.

"The list provides information such as name, address, estimated household income, age of occupants, spouse and number of people in a household," said Wilson Phadely, public affairs officer at IRS. "Dunhill uses public information such as census track and real estate data to develop the list."

These lists are used primarily for locating potential customers and may contain inaccurate information, according to Gitlitz. "Direct marketing companies do not qualify the accuracy of each entry," Gitlitz said. "These lists are used primarily for targeting prospective customers, not for keeping a dossier on every citizen."

Dunhill was not the first company that the IRS approached, according to the DMA. "There were a number of direct marketing companies that were not willing to rent their list to the IRS," Gitlitz said.

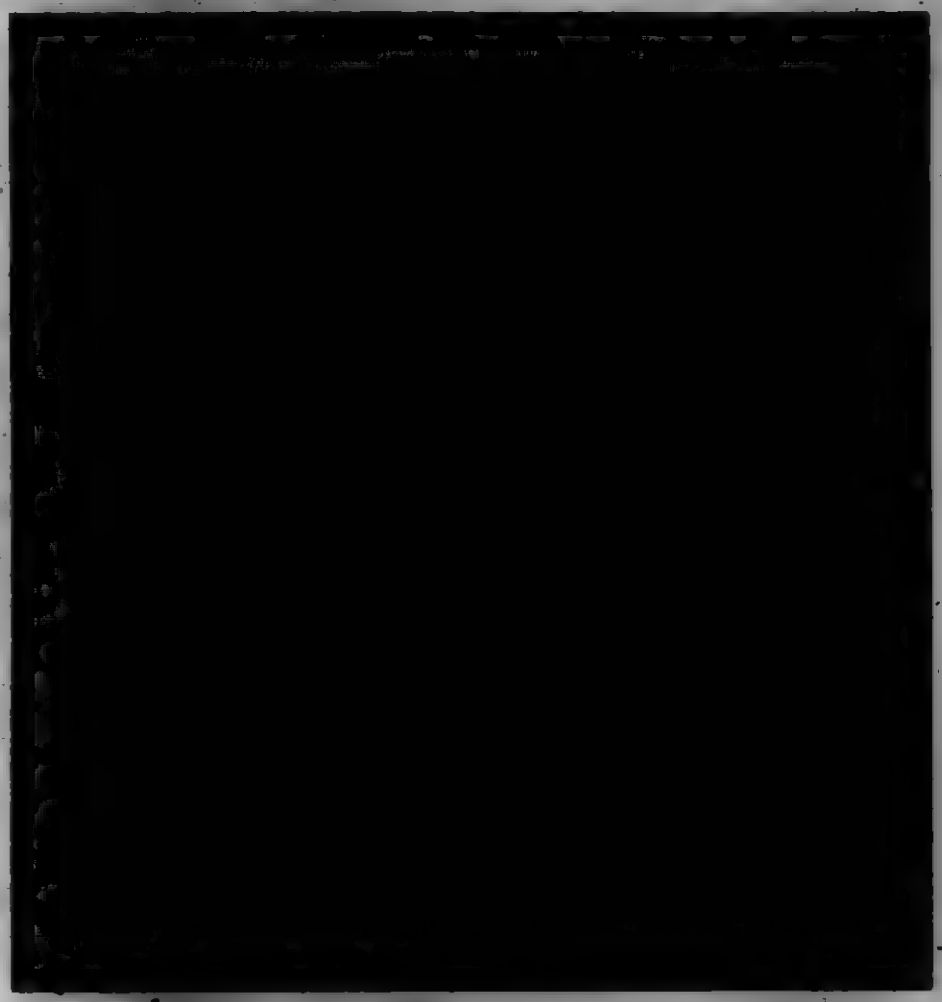
IRS' Phadely said that Milwaukee will serve as the first test site, where the IRS is running the Dunhill list against the government's 1982 Milwaukee tax return list.

"Our system [a National Advanced Systems, Inc. AS/9060] is able to match lists easily," Phadely said. "Annually, we match tax returns against the previous year's return. We have almost completed the computer matching between the Dunhill list and 1982 Milwaukee tax filers list. By April 1, we will mail a list of prospective nonfilers to the Milwaukee office."

Potential nonfilers will be given the opportunity to respond to charges. "In May or June, the local IRS office will mail to [prospective] nonfilers a notice asking why they did not file a tax return," Phadely said. "If they refuse to respond, their cases will be handled like other investigations."

Later this year, this process will be followed in other test sites. When the four test cases are completed, the IRS plans to do a cost benefit analysis on the project. "We estimate that in 1981, there was $5 billion in uncollected taxes," Phadely said. "We hope that techniques like computer matching will help us collect a portion of this money."

If the pilot program is cost effective, the IRS must decide if it wants to implement the system nationally. DMA staunchly opposes nationwide implementation. "Our members will not cooperate with the IRS' plans," Gitlitz said.



Net/One offers something unique in local area networking. A track record.

In fact, Net/One® offers a number of things unique in local area networking. True vendor independence. Media independence—baseband, broadband, fiber optics, or any combination thereof. Remote bridges and local bridges to interconnect separate Net/One systems—broadband or baseband—between buildings, or between cities, worldwide.

And all this uniqueness becomes even more so when you look at our track record. We not only talk a great network, we've actually been delivering Net/One since July of 1980. Hundreds of our systems are already out there moving information for organizations like Control Data, Caltech, Fairchild, ITT, RCA, Boston University, U.S. Forest Service, and Ford Aerospace.

Let's talk about how to turn the equipment you have now—whatever it is—into the network you want, now, with a network you can have, now. And a network that can take you wherever you want to go from here. Net/One.

Office automation not yet a widespread trend: survey

By Patricia Keefe
CW Staff

BILLERICA, Mass. — There is plenty of room for growth in the office automation market, according to a nationwide survey sponsored by Honeywell, Inc., which found that more than half of the offices it surveyed do not have word processing power, and fewer than one in 10 managers use a personal computer.

In an age of automation, even those secretaries working in automated offices typically share equipment or send work to an automated center, according to "Office Automation and the Workplace."

The survey was conducted by Response Analysis, a research firm located in Princeton, N.J. The results are based on a random sample of 443 information-intensive businesses with 100 or more employees. Specifically, 1,264 secretaries (99% female) and 937 managers (84% male) were questioned. One-third of the secretaries worked for three or more managers.

Only 5% of the secretaries surveyed have their own computer. Further, two-thirds of the offices surveyed did not have memory typewriters, and three-fourths or more did not have personal computers, electronic mail and computerized scheduling and filing.

However, in offices where automation has been introduced, secretaries depend upon their equipment. Forty-six percent reported that half or more of their daily work load is automated; more significantly, seven in 10 secretaries said it would be difficult or impossible to handle their work load without the equipment.

Although both managers and secretaries identified communications as the key to improving office productivity, bosses were more likely to say that more automated equipment would increase productivity, while twice as many secretaries cited the need for more of a team relationship, the report said.

The most frequent suggestion offered for improving productivity where automation already existed was more and better training. Secretaries in particular cited training as the single most important change needed when introducing automation into the work place.

The level of satisfaction with automated equipment was found to vary according to the level of automation, with users from companies with high and medium levels of automation expressing the most satisfaction. "Nine in 10 say automated equipment makes their job easier, makes routine tasks go faster and improves work flow through the office," the report said.

Among nonusers, managers are more positive than secretaries about automated equipment, while younger secretaries were found to view automated equipment more favorably than their older peers. Also, a third of these nonusers estimate that half or more of the daily secretarial work load could be automated — an estimation borne out by 46% of secretarial users.

Overall, users and nonusers expressed few, if any, concerns about having automated equipment in their offices.

Copies of the survey are available free from Honeywell, 300 Concord Road, Billerica, Mass. 01821.

Forum to cover factory systems

CHICAGO — The successful implementation of factory automation systems will be the focus of the Factory Systems Summit Conference, which will be held here May 15-16 at the Knickerbocker Hotel by The Yankee Group.

The event will highlight strategies and tactical approaches to managing new factory technology, according to The Yankee Group. Recent developments in factory automation will be explored, and participants will be able to compare the strategies of companies that have already undertaken automation.

According to the sponsor, registrants will be asked to outline the issues most important to them, and speakers will address their topics from the perspective of those issues.

Among the scheduled speakers are Larry Gould, research director of the Factory Systems Planning Service, who will provide an overview of current technology, and Richard Morley of Gould, Inc., who will outline the future of factory systems.

In addition, Howard Anderson, managing director of The Yankee Group, will discuss networking as it relates to industrial automation, and Frank Curtin of the General Electric Co. will speak on the vendor's role in manufacturing system planning and implementation.

Attendance for both days of the Factory Systems Summit Conference is priced at $875.

Additional information can be obtained from The Yankee Group, 14th Floor, 89 Broad St., Boston, Mass. 02110.

Three unresolved issues identified for OA users

By Patricia Keefe
CW Staff

CAMBRIDGE, Mass. — Users of office automation must face three critical, unresolved issues before they can expect to reap its rewards, according to a report by a Yale University professor based here. The issues are:

■ The tension between social roles and efficiency.

■ The "disturbing" use of OA to relieve drudgery only.

■ The need to provide more avenues for employee participation.

In her report, "Office Automation and People: A New Dimension," Rosabeth Moss Kanter asserted that the challenge of office automation is twofold: to use time saved by the computer as a "hand tool" to work on problem solving and innovation and to extend use of the computer as a "head tool" to enrich human minds and communication.

The report is a reaction to the findings of a Honeywell, Inc.-sponsored national survey on office automation. Kanter, who is a consultant to Honeywell, is both a professor of sociology and organization and management at Yale's School of Management and chairman of the board of Goodmeasure, Inc., an international management consulting firm located here.

According to Kanter, the ability to meet the challenge of OA is handicapped by traditional social roles and relationships in the office, particularly the relationship between managers and office workers. Making the best use of OA will mean office role changes, Kanter said.

Coming clash

She warned of a coming clash between office workers desiring more responsibilities and managers who want to maintain current roles. The latter stance was described as a defensive reaction against any change in status or work methods that might arise from the potential of OA to create new roles for secretaries.

The first role change is likely to see younger, lesser paid employees (typically female secretaries) instructing older, better paid managers (typically male) in OA techniques.

What appears to be a status reversal will inhibit some managers from learning about OA, Kanter predicted.

Kanter also advised using computers to help people not only do their jobs faster, but do them better by providing more brain power. "Whereas short-term productivity can be affected by purely mechanical systems, innovation requires intellectual effort," she said.

Noting that the Honeywell study uncovered a strong desire among secretarial workers for greater participation in decision making, Kanter warned that "bringing in major technical change is not simply a technical matter. Participation and collaboration [with workers] are essential to the success of innovation, particularly complex innovations like office automation."

Winners in office of future will use OA as 'head tool': professor

CAMBRIDGE, Mass. — Winners in the office of the future, according to Rosabeth Moss Kanter, will be the corporations that employ office automation as a "head tool" to enhance communication and innovation and are visionary enough to use it to reshape social roles in the office toward more participation and teamwork.

Kanter, a Yale University professor of sociology and management, as well as a management consultant to Honeywell, Inc., offers the following steps as a method to help ensure successful office automation:

■ Well in advance of system implementation, try out plans and ideas on people within the organization to ensure that all key stakeholder groups "buy in."

■ Form a steering committee to manage the entire effort and provide members of the group with special training in people-sensitive consulting.

■ Ensure the involvement of potential users and affected employees by soliciting suggestions and holding management briefings long before the equipment arrives. Use this input to help shape purchasing decisions.

■ At installation, encourage dialogues between users and vendors and ensure that the vendors are willing to modify their plans to accommodate the needs of a particular office.

■ Offer open-ended, people-oriented training that is self-paced, problem-centered and based on real-life problems.

■ Establish monthly user meetings on a permanent basis that provide encouragement and support, including personal and professional growth.

ARE YOU EXPECTING MIRACLES FROM YOUR COMPUTER?

Computers have solved a lot of problems around the office.

But because of their usefulness, sometimes it's easy to expect more from computers than they can possibly deliver.

For example, computers are good for storing data. But they can't store the documents you must keep for evidentiary purposes. And they can't make your old paper files more efficient.

But computers along with micrographics can. Micrographics is 3M's concept of file management that uses microfilm instead of paper to store and retrieve your important documents.

With one of our computer-assisted retrieval systems, for example, you can dramatically improve file retrieval time and virtually eliminate the problem of lost files. All in less space than you now devote to record storage.

The result is a system that not only improves the efficiency of workers, but saves your company time, space and money.

Find out how micrographics can fit into your office automation plans and give you more control of your files. Call 1-800-328-1684 (1-800-792-1072 in Minnesota or 1-800-268-9055, Operator 13 in Canada) or return the coupon for our free booklet. Because good as they are, computers can't do it alone.

GET CONTROL. GET FILE MANAGEMENT.

Tips offered for developing advanced office systems

Informal survey urges MIS directors to broaden base of DP expertise

By Robert Batt
CW West Coast Bureau

Management information systems directors must broaden the base of traditional data processing expertise found in large, Fortune 1,000-type corporations when developing strategies for advanced office systems, a number of experts in the field stressed in a series of recent telephone interviews.

Philip James, vice-chairman of the Office Automation Council of Los Angeles, for example, said MIS directors must put in place an infrastructure of skills to enable the effective management of end-user computing through office systems.

"The skills required to implement technologies such as electronic mail, telecommunications, word processing and voice/data communications are not likely to be found in one person," James maintained. "MIS directors will need to draw upon the back-room data processing skills of their people and combine them with people who have front-room office skills and interpersonal skills," James added.

James, who is also director of strategic planning, corporate information resources, for Northrop Corp., the Los Angeles-based aerospace manufacturer, said very few companies have yet put in place a formal training program to develop and blend such skills.

Broad-based skills

Jack Adams, a partner in the accounting firm of Price Waterhouse & Co., also emphasized the need for broad-based skills. "There are precious few people with the background in voice and data and sufficient business acumen to make a go of advanced office systems," he observed.

"Too often, the MIS director recruits people with skills that are much too narrow and has attempted to launch an office automation program through these people. Usually it turns out to be a pretty sluggish launching," Adams said.

One company that has instituted a formal office systems strategy is Standard Oil Co. of California (Socal). Socal expects to have 1,000 personal computers installed worldwide by the end of the year.

In addition, the company has a network of some 3,000 IBM 3270 CRT terminals running under IBM's Systems Network Architecture (SNA), and it has formed an advanced office systems group to install Xerox Corp. 860 word processing systems connected via three Ethernet local-area networks.

Charles Oldenburg, Socal's general manager of computer services, said, "We are relying on in-house expertise. Our management philosophy is to keep people on a steep learning curve and emphasize team efforts in developing the data processing, telecommunication and user skills that we need."

According to Rod Asher, a person-

OA emergence in large firms to impact MIS

By Robert Batt
CW West Coast Bureau

The emergence of advanced office systems in large corporations will have an enormous impact on the way the management information systems department carries out its functions.

That was the consensus reached by data processing managers and industry consultants in a series of recent telephone interviews.

The development of office technology will lead to a fundamental change in the nature of many MIS programs and the way they interface with their companies as a whole, according to Steven Abraham, senior management consultant at Price Waterhouse & Co. in Los Angeles.

"The major issue facing MIS managers today as a result of office automation," Abraham said, "is how to turn their DP departments into the kind of end-user computing facilitator that organizations now require. This is no small change, since DPers will help to determine the way information is going to be used throughout the whole organization."

John Connell, executive director of the Pasadena, Calif.-based Office Technology Research Group, contended that the changes prompted by office automation are vast and vary from company to company. If the impetus for OA systems comes from the MIS department, Connell said, the developments tend to be more technologically oriented than if another de-

See OA page 28

OA from page 25

partment, such as human resources or administration, were the prime mover behind the technology.

"In some cases, political warfare has arisen as different factions within an organization attempt to increase or maintain their power through the use of office systems," he observed.

Connell sees two major directions occurring concurrently in the development of office systems:

■ The focus of the traditional data center and its support activities on transaction processing.

■ The need to move the technology out and put computing capabilities in the hands of end users.

Very different functions

"The first is a service function, while the second is a facilitating problem. They are, therefore, two very different kinds of functions, and we may not be able to put them in the hands of one person," Connell said.

Abraham suggested one solution would be to hire a new information officer, unmarked by any history of internal political wrangling, who would be responsible for bringing the different elements of advanced information systems together, while leaving the MIS director to concentrate on managing the central DP resources.

"One way or the other, the MIS job is going to change drastically. The MIS director who is protective of his status and not willing to face the new requirements posed by office systems will end up as the loser, and his DP organization will fail in the process," Abraham warned. "The MIS director who makes the necessary adjustments will come out as a big winner."

According to Philip James, director of strategic planning, corporate information resources at Northrop Corp., many DP managers seem to be slower than other departmental managers to change their perspective in dealing with office automation. But James, who is also vice-chairman of the Office Automation Council of Los Angeles, said office systems is a dynamic field that is attracting a lot of dynamic people, and if MIS managers do not develop a greater end-user orientation, they will find themselves with big problems.

"The development of advanced office systems calls for an understanding, at a broad level, of the potentialities of information technologies, a close relationship with senior management and a set of political, technical, organizational and managerial skills to drive home the office of the future effectively," he concluded.

OFFICE from page 25

nel recruiter in Los Angeles who specializes in office systems technology, MIS directors are using all possible avenues to lure office systems specialists into their camp, including such bait as extensive advertising, employment of recruitment agencies and outside consultants, internal training, increased bonuses for employee referrals, technology fairs and the traditional grapevine.

"Right now, the main experts in office automation are to be found among the OA vendors themselves, personal computer manufacturers and among the large end users who have pioneered the use of office technology," Asher said.

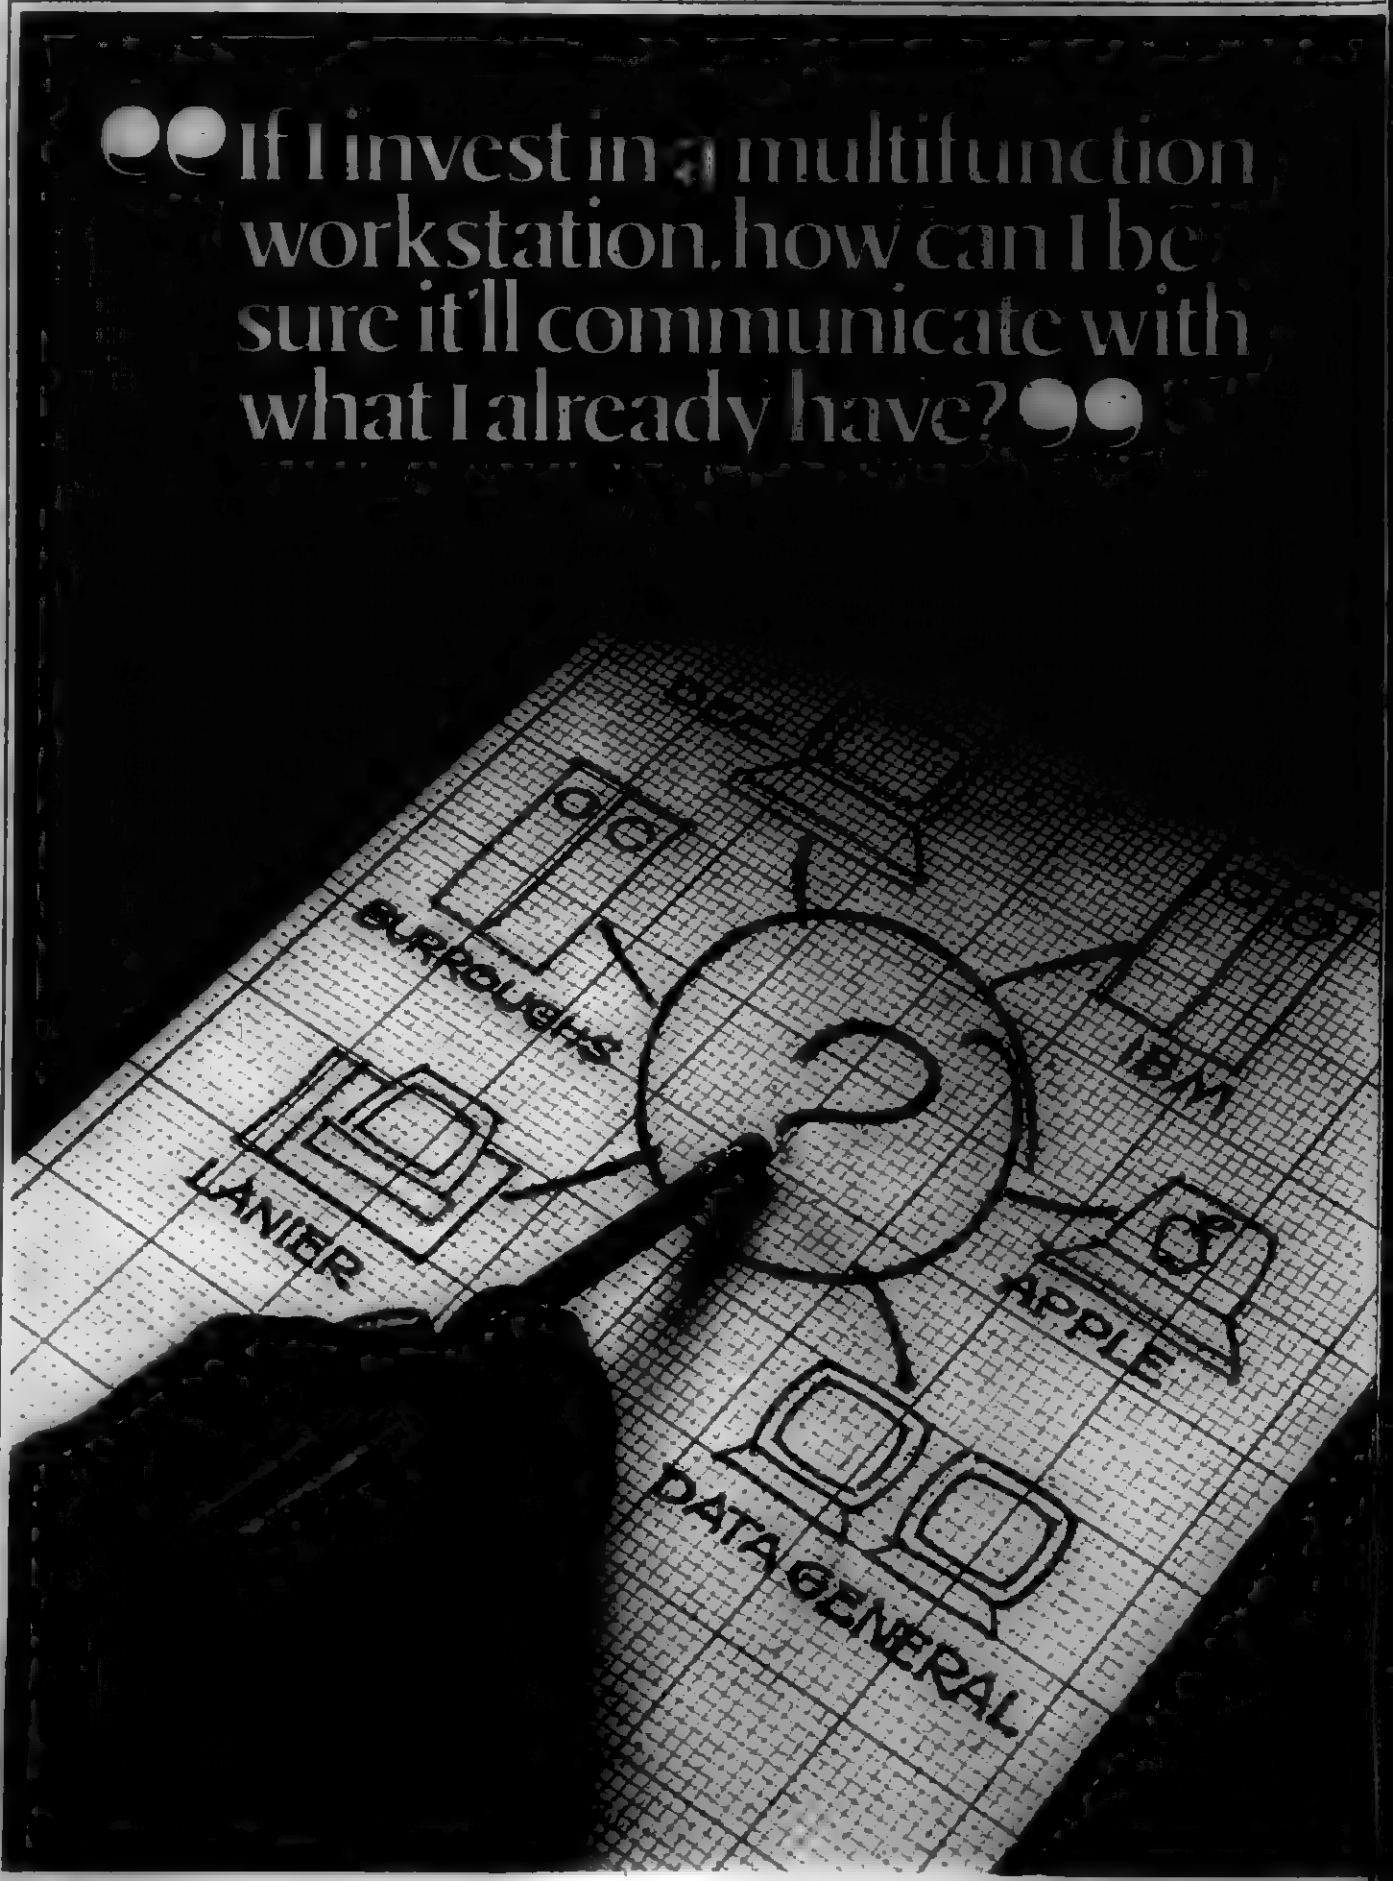
"Corporations will need to become very competitive if they are to lure these people away from their present jobs."

On the other hand, John Connell, executive director of the Office Technology Research Group in Pasadena, Calif., an international association of managers specializing in advanced office systems, contends that the frenzy over the lack of OA specialists is misplaced.

"Office technology is not difficult, and there is no shortage of skills," Connell contended.

"The real need is for people who can move the technology out to nonspecialists and make them comfortable with it.

"While someone in data processing or data communications needs to be concerned with tying the different systems into a network, the real skills are human interaction skills," Connell added. However, he said MIS directors are not well versed in developing those skills among their people.



A look at software productivity: tell us your view

Computerworld's May Special Report will take a close look at software productivity, something our readers are continually trying to improve.

The Special Report will focus on application backlogs and the efforts being made to reduce them; the programmer shortage and whether it really exists; high-level languages and structured programming; and code generators as well as reusable code.

Contributions to the Special Report can take one of two forms: a tutorial article discussing a productivity issue or trend or a user application story outlining a particular firm's experience with a software package.

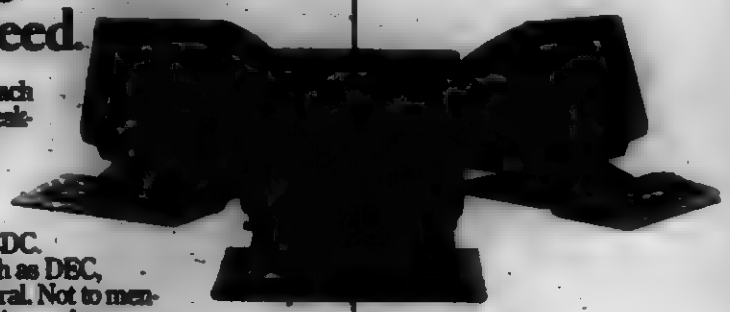
Articles must be typed, double-spaced and can range in length from four to eight pages.

Artwork such as charts, graphs and photographs are encouraged.

Authors should also include with their articles a brief biography and a telephone number at which they can be reached.

The deadline for submissions to the Special Report is March 28. If you have a tale to tell, address it and any questions to Donovan White, Special Reports Editor, *Computerworld*, 375 Cochituate Road, Box 880, Framingham, Mass. 01701.

Northern Telecom's information processing products have the communications capability you need.



The 500 Family.

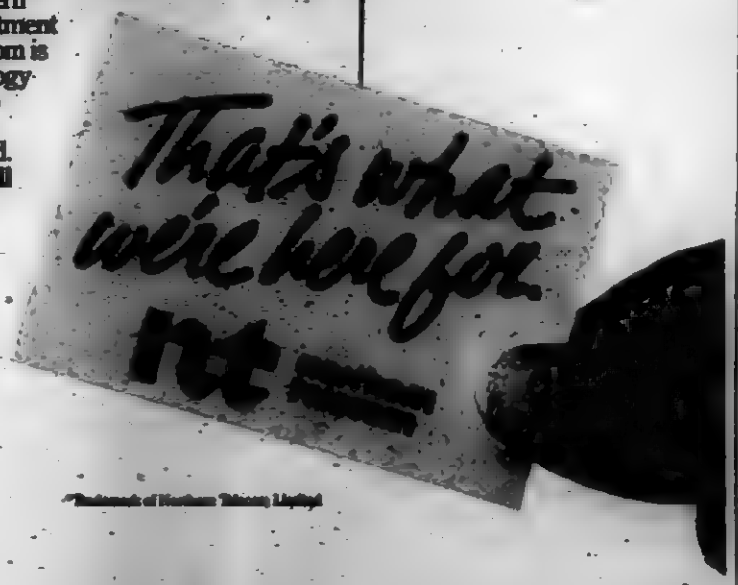
Besides being compatible with each other, Northern Telecom's 503 desktop computer and 565 and 585 information processing systems communicate effectively with a multitude of mainframes, including IBM, Burroughs and CDC. They also talk to other minis such as DEC, Hewlett-Packard and Data General. Not to mention word processors such as Lanier, and even micros such as TRS-80 and Apple.

This means you'll have more flexibility—and more control over your information system. Even if more and more personal computers are becoming a part of it. Our 500 family supports the CP/M® operating system software, so employees can have the personal-computing capabilities they want, while your company keeps the organizational unity it needs.

At the same time it's running CP/M, the family can also be running its own unusually powerful operating system which is compatible across the whole 500 line. It permits a unique approach to multitasking—with a few simple keystrokes, up to 16 tasks can be performed simultaneously on the same terminal. Data processing, personal computing, spread sheets, word processing, information management, electronic mail, whatever task needs to be done can be done at the same time. An incredible timesaver.

All in all, the 500 series is quite a family. Versatile, reliable and a perfect example of Northern Telecom's OPEN World® commitment to compatibility. Northern Telecom is a world leader in digital technology and we're using this expertise to make sure our products fit comfortably into a multivendor world.

For more information, call 800-621-6476 (in Illinois 800-572-6724), or write to Northern Telecom Inc., P.O. Box 10934, Chicago, IL 60610.



®Trademark of Digital Research Inc. ®Trademark of Northern Telecom Limited

MANAGERS ON THE MOVE

FRANK GRAU, director of management information systems for General Development Corp., has been named assistant vice-president of management information systems. Grau will have overall responsibility for administration of the corporate information and word processing functions for the Miami-based company.

Grau was with General Development from 1974 to 1981 as manager of systems and programming in the MIS department and later as assistant vice-president of community operations.

From 1981 to 1983, he served as vice-president of marketing for Colonial Data Systems, Inc. and director of management information systems for Interterra, Inc. He rejoined General Development in June 1983 as director of management information systems.

Grau holds a bachelor's degree from the University of Jose Marti in Havana and also attended City College of New York.

■

JOSEPH L. BROWN has been elected assistant vice-president of systems and programming for Lincoln First Bank's new National Bank of Westchester division in White Plains, N.Y. Brown joined Lincoln First Bank in 1976 as an analyst in the systems and programming department.

In August 1979, Brown advanced to senior analyst and in March 1981, he was appointed systems officer. In October 1983, Brown was promoted to assistant vice-president.

Prior to his arrival at Lincoln First Bank, he served 10 years with Westchester/Rockland Newspapers, Inc.

■

DOUGLAS A. STEVENS has been named director of new systems development for the Grand Union Company in Parsamus, N.J.

Prior to joining Grand Union, Stevens was product manager of on-line directory systems and manager of overseas data processing for ITT in Secaucus, N.J.

He graduated from Miami University with a B.A. in economics and from Rutgers University with an MBA.

Supercomputers aid understanding of solar activity

By David Gleeso
CW Staff

BOULDER, Colo. — Aided by a sophisticated $35 million computer facility at the National Center for Atmospheric Research (Ncar), astronomers have developed the first solid evidence of a connection between the sun's speed of rotation and the 11-year sunspot cycle.

Peter A. Gilman of the research center's High Altitude Observatory here specializes in building highly complex numerical models of the sun utilizing the center's two Cray Research, Inc. Cray-1/A supercomputers. His models were instrumental in establishing the correlation between sunspot activity and solar rotation.

A senior scientist and head of the observatory's solar variability section, Gilman worked on the project with Robert Howard, a prominent solar astronomer based at the Mt. Wilson observatory in Southern California. Pamela Gilman (no relation), a research assistant at the Mt. Wilson observatory's headquarters in Pasadena, Calif., also participated in the project.

Scientists have known that the sun is spinning rapidly, with the equatorial region making a complete rotation in about 27 days. The cycle of sunspots changes between minimum and maximum activity during an 11-year period. Gilman and Howard have discovered that the sun's rotation speeds up every 5½ years, at both minimum and maximum sunspot activity — an occurrence they call the "twin-peak effect." During these periods, the speed of the sun varies by as much as 1%.

Howard said the finding "implies that some internal dynamic — some very large internal circulation — is going on, which is probably responsible for the [sunspot] cycle and which has an effect on the sun's rotation."

May lead to an explanation

"We don't understand what causes the activity cycle," Howard added, but "we do know it's magnetic in origin and that it takes place somewhere in the sun." However, the latest finding does provide a clue that may someday lead to an explanation of the sunspot cycle.

Gilman explained that his modeling has concentrated on understanding what is occurring in the sun's convection zone, a region that is believed to occupy roughly the outer one-third of the radius of the sun.

The center's two Cray-1As are front-ended by twin IBM 4341 mainframes. The center uses an Ampex Corp. Terabit Memory System (TMS-4) for mass storage. Two Dicomed Corp. D-48C document microform systems are used for processing graphics data; they are controlled by a Digital Equipment Corp. PDP-11/34 minicomputer. Ncar staff members have interactive programming capabilities provided by two DEC PDP-11/70 minicomputers.

Gilman's finding is based on an analysis of data collected from 23,000 photographic plates of the sun taken daily over the last 67 years with Mt. Wilson's solar tower. Gilman and his colleagues plan to conduct a similar analysis of another plate collection dating back to 1906 that was recently discovered in India.

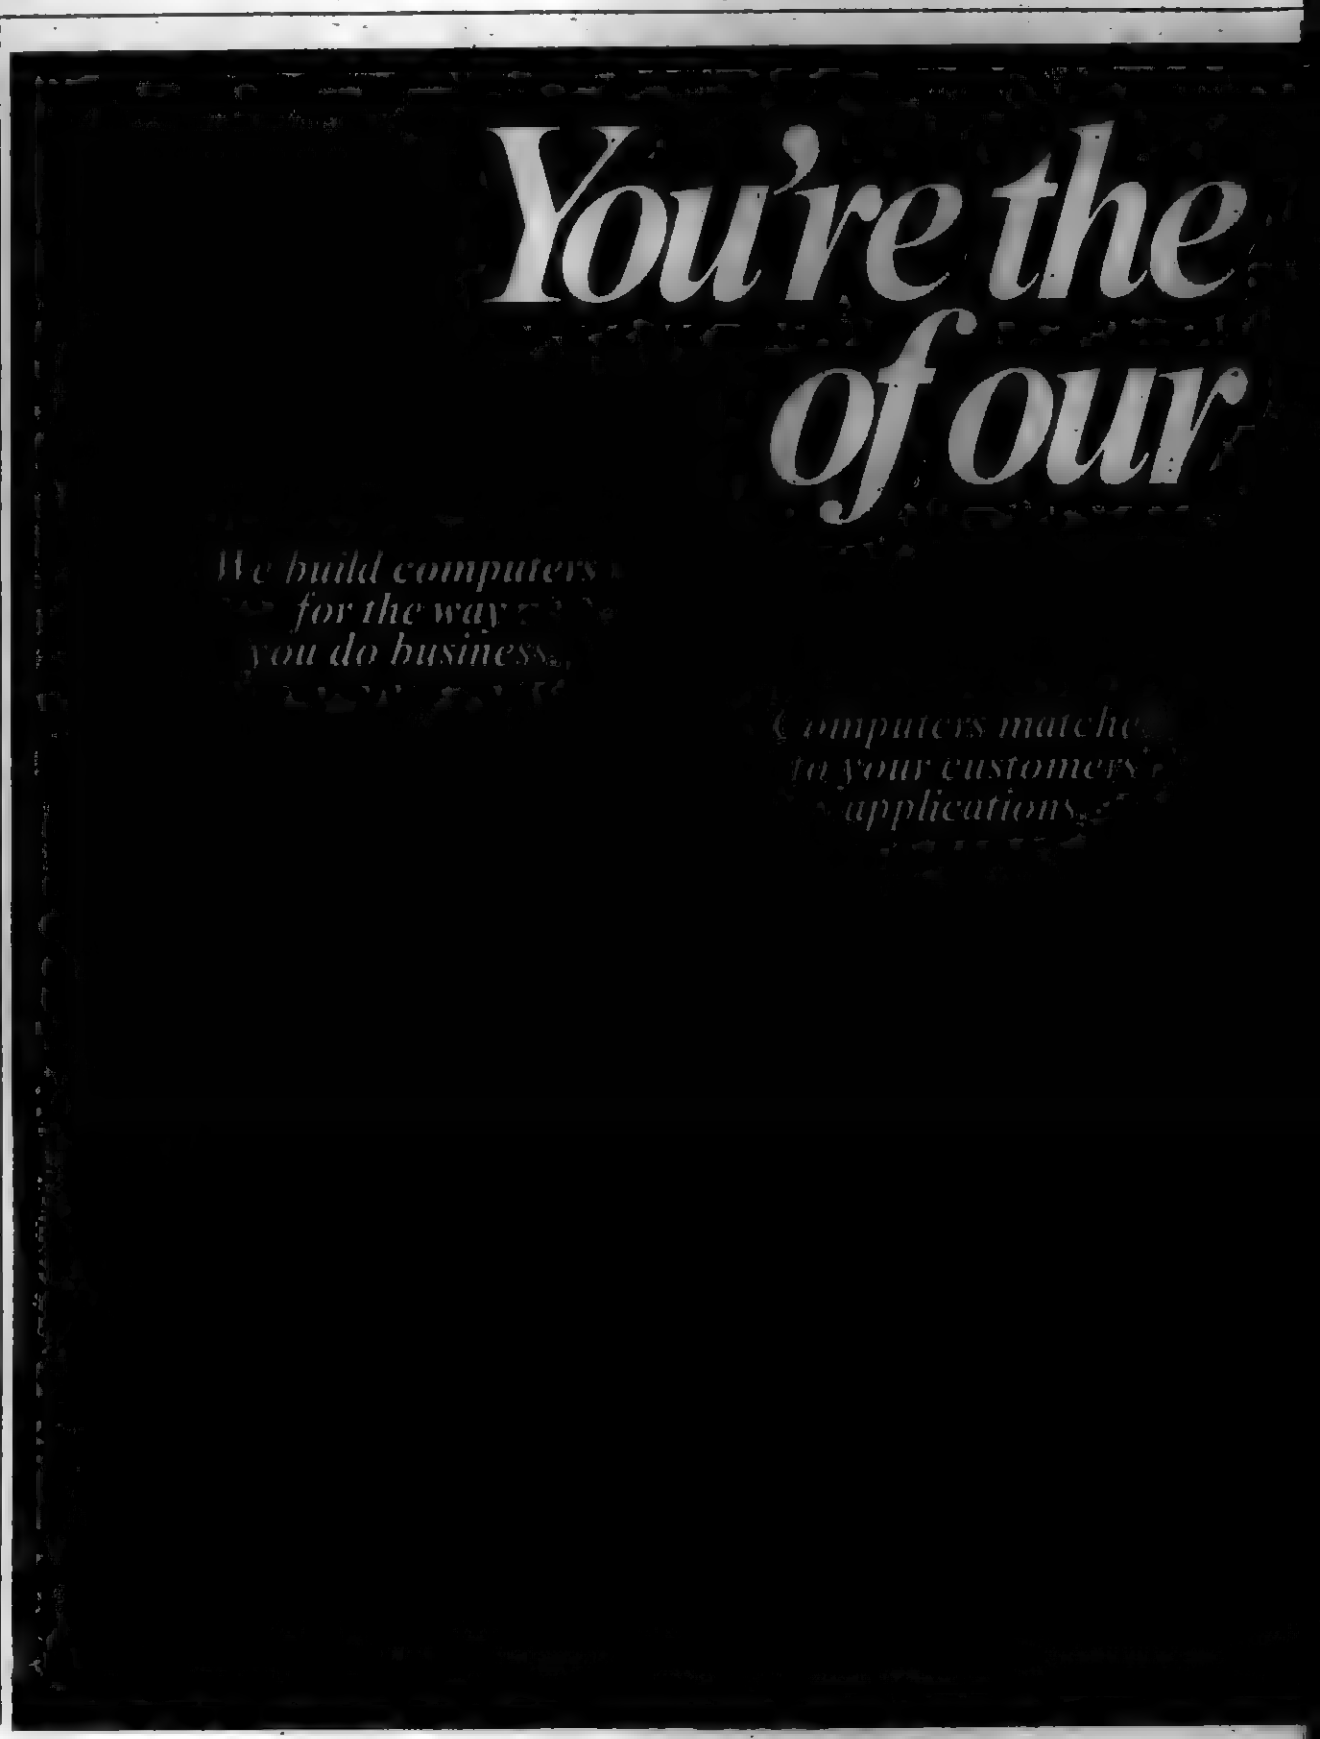
Gilman has been involved for 10 years in building mathematical models of the global, dynamic properties of the sun, in particular, convection, differential rotation and the solar dynamo — the mechanism by which magnetic fields are amplified and maintained. Before large, very fast computers were developed in the 1960s, Gilman said, it was impossible to explore systematically the theory of differential rotation and the solar cycle.

"These models do not have exactly the same physics in them that the sun does; in fact, they're considerably simpler," Gilman said. "Nevertheless, they are still very complicated and require enormous amounts of computer time." He said that performing just one large modeling calculation can require 50 hours of computing time on the Cray alone.

Supercomputers that can perform massive number-crunching calculations are now "clearly indispensable" in his work, Gilman said.

The center's computing facility is one of the largest in the U.S. dedicated to scientific research and is the only one used solely for atmospheric science and solar physics, according to an Ncar spokesman. Ncar is operated by the University Center for Atmospheric Research under the sponsorship of the National Science Foundation.

Some 80 qualifying universities and research organizations in the U.S. and Canada are linked to the center's computing facility by remote terminals.



NEWS

Upcoming electronic novels to let readers twist the plot

By Edward Warner
CW Staff

SUNNYVALE, Calif. — A woman is strolling on a beach. She spots a handsome man seated on the sand. Should she stop and talk with him? Go for a swim with him? Accompany him to the nearby bar?

Readers will get to make that decision — at their computers — in a diskette-based novel called *Island Love*, soon to be released by Home Computer Software, Inc. here.

Island Love is one of a series of interactive novels — stories where the reader decides the plot's twists — that are about to be unleashed on the reading public by several software publishers. Simon & Schuster, Inc. has signed Robert Heinlein, author of *Stranger in a Strange Land*, and six other science fiction writers to script "floppy books" for its Baen Software label, a series scheduled to debut in April. Synapse Software is said to be ready to release seven electronic novels this spring which, unlike the Home Computer Software products, will reportedly not require users to interact at all if they choose not to.

It is Home Computer Software, though, that is going for the widest ranging market, from adventure stories to mysteries, historical novels and science fiction. For the readers of romance fiction, the company will publish both teenage and adult interactive novels, said Bob Katz, Home Computer Software's marketing and sales vice-president. But, he noted, the adult romance, *Island Love*, will have no steamy beach scenes in its range of plot options.

"They're not going to get too racy; we're going after the mass market," Katz said.

The company will also market a story called *What if Lincoln Had Lived?* that will give users a chance to affect events in the Reconstruction-era South. Another, called *Your Championship Season*, makes the reader a team coach, complete with a player who has a drug problem. "That's real life, you know," Katz pointed out.

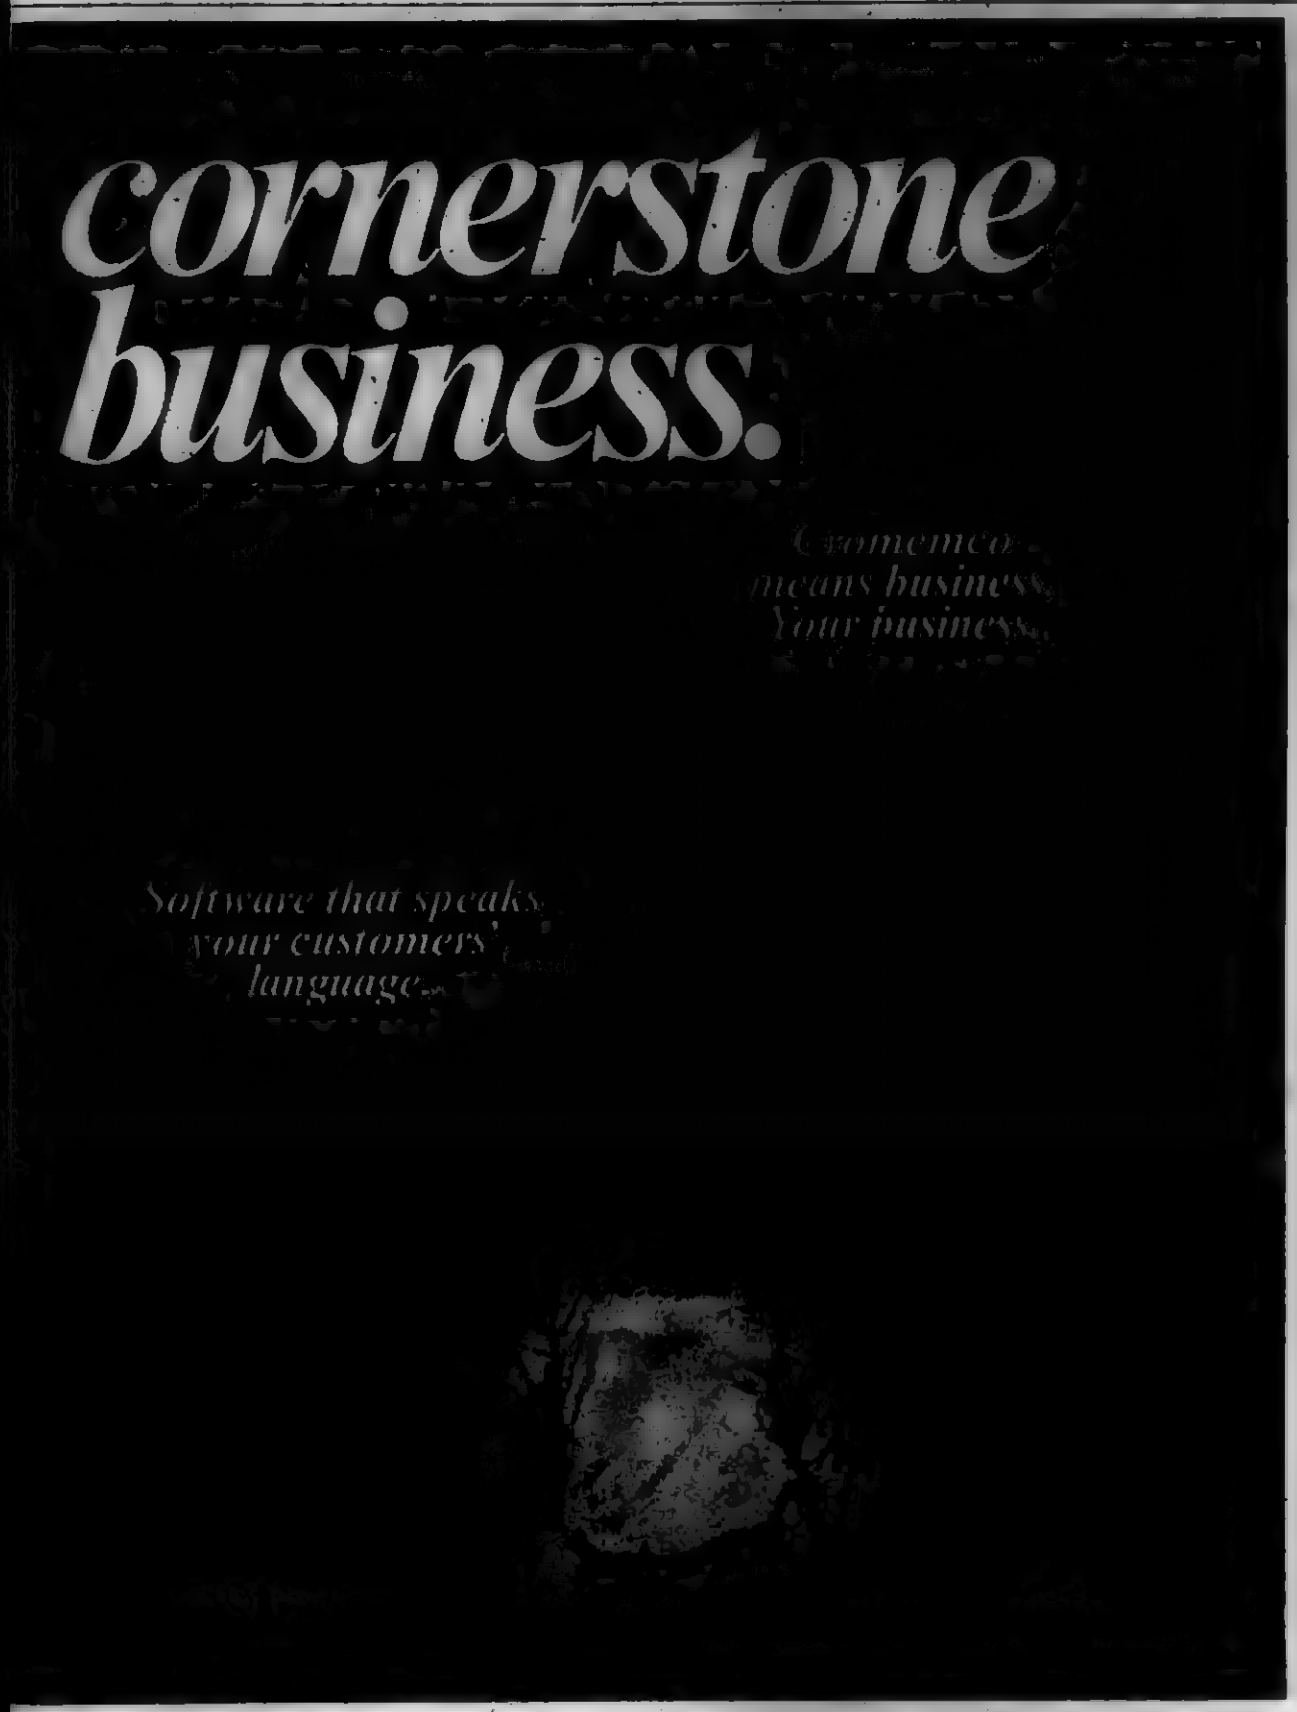
Katz said the stories, some of which have as many as 50 possible endings, will encourage reader creativity. The stories will include graphics and eventually will include electronic "bookmarks" that allow readers to shut off their novels, then turn them on again and instantly pick up where they left off.

Between 30 and 40 authors, including many teachers, are writing for the series, Katz said, adding that none have balked at turning over creative decision making to their readers. "They love it," he said. "This gives the writer the option to develop all those endings."

The Home Computer Software "Stories Alive" series will be delivered to retail book and computer stores in about 90 days, Katz said, and novels in the line will average in cost from $19.95 to $29.95, with none over $39.95. They will run on the Apple Computer, Inc. Apple II, Commodore International Ltd.'s Commodore 64 and the IBM PCjr.

Synapse Software will provide its electronic novels in July at an average price of $40, according to a spokesman. They will run on all Warner Communications, Inc. Atari computers, the Apple II series and the IBM Personal Computer and PCjr.

Simon & Schuster's Baen Software will reportedly carry an average retail price of $25 to $35 and will be available for the Apple II and IIe computers, the PCjr, Atari 400 and 800 models and the Commodore 64.



Martin seminar to open April 2

SANTA MONICA, Calif. — The Spring 1984 James Martin seminar, a four-city, five-day seminar on "The New DP Revolution," will be held first April 2-6 at the Marriott Crystal Gateway in Washington, D.C.

Sponsored by the Technology Transfer Institute, the seminar is geared toward general managers, DP managers, systems analysts and designers, programmers, data base staff, teleprocessing and networking specialists, planners, end users and business people.

Some of the topics included in the seminar include "The Information Center," "Information Engineering," "Fourth-Generation Languages," "User-Driven Computing," "Automation of Data Base Design," "Superintelligent Networks," "IBM's Architecture for Future Office Automation," "Techniques Analysis," "Automated Application Generation," "Electronic Office Integration" and "An Information Systems Manifesto."

The seminar will also be given April 9-13 at the Hyatt on Union Square in San Francisco; April 23-27 at Chicago's Hyatt Regency; and April 30-May 4 at the Hyatt Regency in Cambridge, Mass. The registration fee is $1,495.

Further information is available from the Technology Transfer Institute, 741 10th St., Santa Monica, Calif. 90402.

Capacity management conference set

Author of 'Megatrends' to keynote April 9-12 event

WASHINGTON, D.C. — John Naisbitt, the author of the best-selling book "Megatrends," will be a keynote speaker at the sixth annual International Conference on Computer Capacity Management here April 9-12.

Titled "Information Engineering — The New Frontier," the conference will examine the changing role of information management over the next 30 years.

Other keynote speakers will be William Synnott, senior vice-president of the Bank of Boston and author of "Information Resource Management," and Frank Reeder of the U.S. Office of Management and Budget's Information Policy Branch, according to the show management.

The president of Boole & Babbage, Inc., Jack Van Kinsbergen, and the originator of "Murphy's Law," Edward Murphy Jr., will also speak, according to the conference management.

Topics to be addressed at the conference will include the banking industry's approach to information engineering, successful information management, decision support systems, information as the asset of the 1990s and new computer architectures, according to meet sponsors.

The conference is sponsored by the Institute for Information Management and will be held at the Capitol Hilton.

Conference registration fees are $395 for IIM clients and $495 for nonclients. The conference's day-long tutorials are $195 each, and one-day conference attendance is $195, according to the show management.

Further details are available from the Institute for Information Management, which is located at 150 Oakmead Pkwy., Sunnyvale, Calif. 94086.

Cincom forum to target MRPS users

CINCINNATI — Cincom Systems, Inc. has announced that its second annual North American MRPS User Conference will be held April 1-4 at the Marriott Inn here.

Cincom's MRPS is a production and inventory control software package that operates on IBM mainframes and the Digital Equipment Corp. VAX-11 series of superminicomputers, according to a Cincom spokesman.

Conference activities will include user presentations on particular MRPS applications and discussions led by the Cincom staff about product and strategic plans, a Cincom spokesman said.

The conference registration fee is $250 for the first representative of a company and $150 for each additional person.

More information is available from Cincom Systems, Inc., located at 2300 Montana Ave., Cincinnati, Ohio 45211.

AMS '84 meet slated for June 12

CHICAGO — "The Computer: Mind of the Factory of the Future," will be the theme of the Advanced Manufacturing Systems Exposition and Conference (AMS '84), scheduled for June 12-14 at McCormick Place here.

The show and conference, sponsored by Clapp and Poliak (a Cahners Exposition Group), will feature demonstrations of information systems and automated production systems directed to the needs of manufacturing companies.

More than 50 sessions are reportedly scheduled focusing on areas such as productivity improvement systems, planning for closed-loop systems, advanced manufacturing systems technology and material control systems.

Information-related exhibits are expected to include computer-aided design and manufacturing systems, computer accessories and peripherals, various-size computers, duplicating systems, data collection and communications systems, distribution systems and software for manufacturing, according to show management.

Production-related sessions are scheduled to include robots and robotics, automated inspection equipment, programmable controllers, flexible manufacturing systems, optical measurement systems and laser equipment.

The price for the three-day conference is $295. One-day conferences are priced at $150 and half-day conferences at $85, according to the show management.

More information is available by writing AMS '84, 708 Third Ave., New York, N.Y. 10017.

VISUAL 50/55

The expert's choice in low cost terminals

VISUAL 50 is widely acclaimed as the best performing low cost terminal. Experts say it is in a class by itself for visual quality and price/performance.

VISUAL 55 extends its predecessor's performance even further by adding 12 user-programmable non-volatile function keys, extended editing features and selectable scrolling regions.

Both the VISUAL 50 and VISUAL 55 offer features you expect only from the high priced units.

- Tilt and Swivel Monitor
- Detached Keyboard
- Non-Glare Screen
- Smooth Scroll
- Large 7x9 Characters
- Menu Set-up Mode

And both VISUAL terminals are code-for-code compatible with the Espirit™, ADDS Viewpoint®, Lear Siegler ADM-3A and DEC VT52.® Plus the VISUAL 55 also emulates the Hazeltine 1500/1510.

VISUAL 50 and VISUAL 55. The choice of those who know terminals best.

Data Access Systems, Inc., the choice of those who want a single source supplier with widely acclaimed capabilities. DASI sells, leases and services the corporate user from a multi-million dollar inventory of PC's, CRT's, printers and modems. Its nationwide service locations give you same day on site service. And with an extremely large leasing base, DASI will tailor a financial package to meet any budget.

INTERNATIONAL REPORT
CW International News Network

BRAZIL

RIO DE JANEIRO — A software product developed at the State University of Rio De Janeiro features a special man-to-machine interface that is said to reduce application development time significantly. The software is called Gim, and its interface reportedly prompts the user by talking him through the development process with voice commands, a University spokesman said.

■

RIO DE JANEIRO — Brazil's Special Department of Informatics has two months left to establish a firm policy for the medium-size computer systems market, which traditionally has been reserved exclusively for Brazilian companies. The computer manufacturing projects that are most often granted government approval have come from Brazilian companies that rely on their own technology or on IBM-compatible foreign technology. Four conflicting legislative proposals for a national computer policy (Informatics Law) are currently under debate and are mobilizing all political factions. The proposal of Democratic Party representative Cristina Tavares calling for strict market reservation is favored by the Brazilian business community, while it is also considered to be the most radical, sources reported.

■

RIO DE JANEIRO — While other sectors of the Brazilian economy found themselves deep in the throes of depression, the information processing industry continued to show exceptional growth in 1983, according to a recent report from the Association of the Brazilian Computers and Peripherals Industry (Abicomp). The report cited computer industry sales last year of $450 million, with personal computers and financial terminals showing the highest growth margin. The report also claimed some 16,000 jobs were created last year by the indigenous computer industry.

FRANCE

PARIS — An additional operating system plus three dual processors for its DPS 7 range of systems were unveiled here last week by Bull, the French computer conglomerate formerly known as CII-Honeywell Bull. The Gcos 7 operating system reportedly features some 20 software programs and languages for users with and without computer expertise. The operating system will run on all members of the DPS 7 family and is compatible with its predecessor, Gcos 64, according to Bull.

Falling in the medium to high end of the company's product line, the three dual processors — DPS 7/60P-Dual, DPS 7/70-Dual and DPS 7/80-Dual — feature increased memory capacity to 8M, 12M and 16M bytes, respectively. Pricing on this series begins at approximately $1 million for a 4M-byte DPS 7/60P-Dual with two 1,200 line/min printers, two 6,250 bit/in. tape drives and a front-end processor capable of managing up to 14 communications lines.

JAPAN

TOKYO — AT&T Japan, in conjunction with Tokyo University, is in the process of creating a standard for a Japanese Unix operating system that would support Kanji characters. Toshiba Corp., the original maker of Japanese Unix, is making plans to keep pace with AT&T. According to sources, a standard for Japanese Unix is needed badly because several different and incompatible Japanese versions of Unix by various Japanese vendors have sprouted up around the country.

■

TOKYO — The Ministry of Finance recently granted permission to credit companies to communicate with banks' computers. Credit-card holders will be able to use cash dispensers or automatic teller machines of the affiliate banks as of April 2.

WEST GERMANY

BONN — The German federal government has earmarked over $1 billion for technological research in microelectronics, information processing and communications over the next four years. The program is intended to bring new technologies to a practical level of use here.

A RATIONAL APPROACH TO RELATIONAL AND DECISION SUPPORT SYSTEMS

A One-Day Seminar with Bill Inmon

If you use relational and decision support systems—or if you're getting ready to use them—you won't want to miss this seminar. You'll learn about:

- Hierarchical versus relational systems
- Operational and decision support systems
- Actual cases of success and failure

In Cleveland: April 26 • In Boston: April 27

For more information, please call Lynn Kolenich in Cleveland at (216) 241-4380; in Boston, please call Sam Carroll at (617) 574-5244.

Coopers & Lybrand

Give your Information Center users the world.

An Information Center should be a company-wide resource taking advantage of modern technologies through the integration of hardware, software and data communications.

There are many communications companies in the world. There are many software companies. But for full integration of communications and software, there is only one I.P. Sharp.

With I.P. Sharp's products for the Global Information Center, your users enjoy:

- IPSANET...one of the world's most advanced private communications networks providing secure error-free transmission anywhere your company operates.
- Integrated Software...a library of end user productivity tools to reduce your applications backlog. Products for today's decision making.
- Worldwide User Support...through I.P. Sharp offices in 22 countries.
- Online Public Data...access to over 100 numeric data bases to complement corporate data and help your organization make informed decisions.
- Integration of PC's and mainframes...with a single application development language, SHARP APL.

Ready to install, ready to run, and already proven on an international scale by I.P. Sharp clients, the Global Information Center gives you the most advanced implementation of the Information Center concept.

Why not let them have the world?

Call your nearest I.P. Sharp office in one of the cities listed below and we'll show you how your Information Center users can have the world.

Library's computer course swamped with registrants

TACOMA, Wash. — When the Tacoma Public Library started a free computer education program last year, library officials anticipated a good deal of public interest.

But they never imagined that more than 600 people, including the mayor, would wait for hours in long lines outside the library's main branch during a two-day class registration.

"It was quite a shock to see the overregistration that occurred," said Phillip L. Maxfield, an assistant director for the library. Today, the pilot program, named Compulit, is still a big hit with Tacoma-area residents.

Library officials developed Compulit after learning that while computer education courses were available in area schools, no such programs were available for adults. Compulit consists of three computer literacy classes, a microcomputer laboratory and a computer checkout service in which class enrollees are allowed to take home a Timex Computer Corp. Sinclair/1000 microcomputer.

The classes offered are "Computer Literacy," "Programming in Basic" and "Selected Microcomputer Applications." Designed by the library staff and consultants, the courses are restricted to persons 18 years and older. Classes are held once a week for four to eight weeks.

The computer laboratory is equipped with a variety of microcomputers — an Apple Computer, Inc. Apple II, an IBM Personal Computer, a Kaypro Corp. Kaypro II, a Morrow Designs, Inc. Micro Decision, a Radio Shack TRS-80 Color Computer and TRS-80 Model III and a Victor Technologies, Inc. VIC-20. Many popular home and business software programs are available for the various systems. Six Sinclair/1000s are available for at-home use.

The Compulit courses have proven popular with all age groups. Slightly more than half of those enrolled have been between 36 and 64 years old. The students have been about equally divided between men and women, according to library statistics.

First-year funding for the program came from a $40,000 Library and Construction Act grant from the Washington State Library Commission and $20,000 from the library budget. Maxfield said the library would like to continue, and perhaps expand, the program after the grant money is exhausted in June if a new source of funding can be found.

Update stresses productivity

ATLANTA — The Life Office Management Association (Loma) has released "The Productivity Challenge II," an update of "The Productivity Challenge," which covered the start of an extensive productivity program at The Hartford Insurance Group.

"Productivity Challenge II" follows The Hartford's program into production and describes 1982-83 developments, indicating lessons learned about specific products, implementations and support methods and organizational structures. It was written by John T. Crawford, director of MIS at The Hartford.

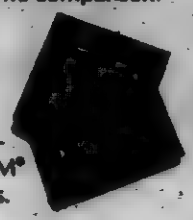
Crawford and his staff discuss reusable code, unit testing, high-level languages, business and flow graphics and software evaluation.

"The Productivity Challenge II" costs $12 for non-Loma members, $8 for members plus $2 for postage and handling from Nancy Taylor, Accounting Department, Loma, 100 Colony Square, Atlanta, Ga. 30361.

The TeleVideo IBM PC compatibles. The best hardware for the best software.

TeleVideo versus IBM. Make a few simple comparisons and you'll find there is no comparison.

RUNS IBM SOFTWARE.



With the TeleVideo® IBM Compatible line—PC, XT and portable computers—you'll get the most out of all the most popular software written for the IBM® PC—more than 3,000 programs.

Because every TeleVideo Personal Computer offers the highest level of IBM compatibility on the market and has the standard—not optional—features you need to take full advantage of every job your software can do.

THE BEST HARDWARE FOR THE BEST PRICE.

Features	Tele-PC	IBM PC	Tele-XT	IBM XT
Monitor	YES	OPTIONAL	YES	OPTIONAL
Screen Size	14"	12"	14"	12"
Tilt Screen	YES	NO	YES	NO
Quiet Operation	YES (NO FAN)	NO	YES	NO
Memory	128K	128K OPTION	256K	256K OPTION
Graphics Display (640 x 200 resolution)	YES	OPTIONAL	YES	OPTIONAL
Printer Port	YES	OPTIONAL	YES	OPTIONAL
Communication Port	YES	OPTIONAL	YES	YES
MS™DOS/BASIC®	YES	OPTIONAL	YES	OPTIONAL
System Expansion Slot	YES	YES	YES	YES
RGB and Video Port	YES	OPTIONAL	YES	OPTIONAL
Typical System Price	$2998	$3843	$4695	$5734

Study the chart below. It proves that TeleVideo—not IBM—offers the best hardware for the best price.

Note that TeleVideo's ergonomic superiority over IBM extends from fully sculpted keys and a comfortable palm rest to a 14-inch, no glare screen that tilts at a touch.

THE BEST MICROCHIPS.

What is perhaps most impressive about the TeleVideo IBM PC Compatible can be found deep within its circuitry. We use the same 8088 central processing unit that runs an IBM PC. But we also employ new VLSI (Very Large Scale Integration) microchips that are designed and built exclusively for TeleVideo. These interface more efficiently with the powerful 8088 and yield numerous benefits.

For example, our tiny custom chips do the work of many of the larger, more expensive circuit boards in an IBM PC. So we can offer a computer system that comes in one attractive, integrated case, is ready to run and occupies less desk space. A computer that edges out IBM's added-cost component system for reliability, ease of service and purchase simplicity.

Fewer circuit boards to cool also allowed us to eliminate the noisy, irritating fan IBM and most other PCs force you to put up with. And TeleVideo compatibles accept any IBM hardware options without modification.

THE BEST PORTABLE FOR THE BEST PRICE.

Features	TPC II	COMPAQ
High Capacity Storage	YES	NO
2nd Disk Drive	YES	OPTIONAL
Quiet Operation (No Fan)	YES	NO
Ergonomic Display	YES	NO
Communication Port	YES	OPTIONAL
International Power Supply	YES	NO
MS™DOS 2.11	YES	NO
Graphics Display	YES	YES
Typical System Price	$2595	$3719

THE BEST LINE.

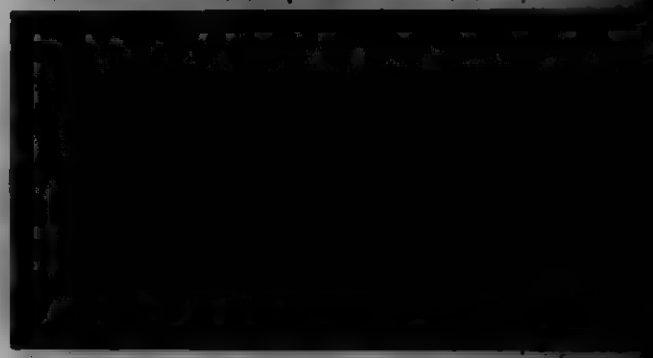
But the Tele-PC is only one element of the TeleVideo IBM PC Compatible line.

The TeleVideo XT is the best hardware for users of popular IBM XT software who would appreciate an extra 10 megabytes of storage capacity along with the advantages listed on the chart at the left.

As the chart above demonstrates, our portable IBM compatible computer, the TPC II, is far and away better hardware than COMPAQ.™ Better hardware—standard—at a better price.

THE BEST MANUFACTURER.

The TeleVideo IBM PC Compatible line is made



by the world leader in multi-user computer systems and the number one independent manufacturer of terminals.

Our compatibles are available at participating ComputerLand and Entré (call 800-HI-ENTRE) dealers or you may call 800-538-8725 for the dealer nearest you. In California, call 408-745-7760.

Before you invest, make a few simple comparisons. You'll find that TeleVideo—not IBM or COMPAQ—has the best hardware for the best software. At the best price.

IBM is a registered trademark of International Business Machines. MS is a trademark of MicroSoft Corporation. GW Basic is a registered trademark of Microsoft Corporation. COMPAQ is a trademark of COMPAQ Computer Corporation.

Info center package links firm's diversified services

PHOENIX — The choices available when assembling an information center come down to two: Select from a diverse range of tools, or go with a tailored package. Talley Industries, Inc. here chose the latter, with considerable success, according to company officials.

Talley and its 16 diversified operating companies generate $300 million in annual sales. The company's commercial group manufactures clocks and timing instrumentation under the trade names Westclock and Seth Thomas. The government and technical segment is in the business of aerospace engineering and manufacturing products. A third segment consists of companies producing apparel and soft goods for major retailers. Talley's fourth segment is its realty group, involved largely in the development of industrial properties.

Executive management at Talley continually confronts the problem of improving parent company performance by analyzing the performance of subsidiary companies. But each subsidiary has a fairly high level of autonomy, which has spawned incompatibility among Talley's DP reporting systems, according to Rodney D. Palmer, manager of financial analysis and reporting.

Talley requests that each company provide the headquarters office with a financial data sheet every 30 days. "Without computer help, we found we simply could not handle that periodic outpouring of data," Palmer said. "Trying to furnish our executives with meaningful summaries and special statistics within any reasonable length of time had become virtually unattainable."

Talley chose remote on-line services offered by Xerox Computer Services, Inc. of Los Angeles. "Xerox offers a wide range of business management programs, with integrated packages available for manufacturers, distributors and public service agencies," Palmer said. "And the Xerox customer has a choice of on-line services, licensing Xerox software or a turnkey hardware/software installation on user premises."

Mixed approach

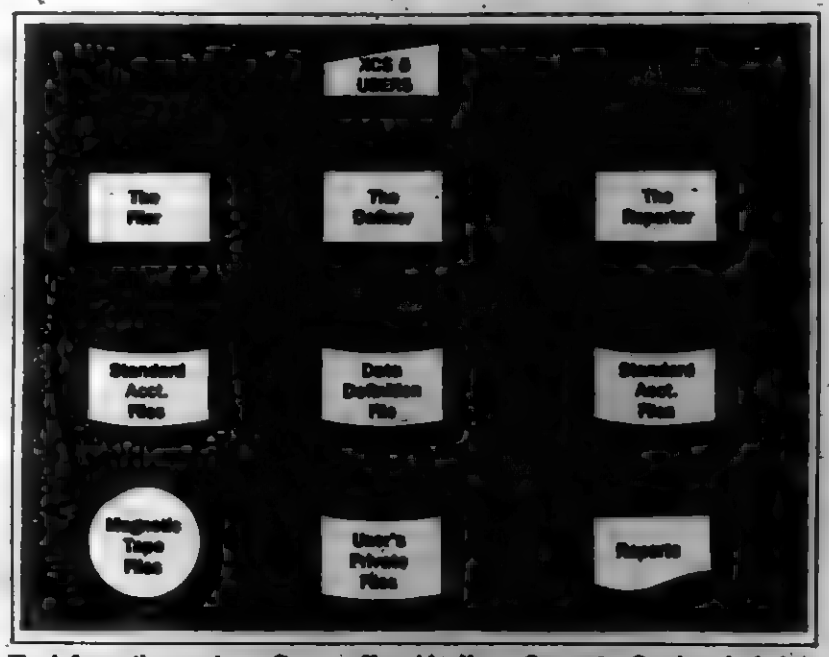
Talley went with a mixed approach, choosing the general ledger and accounts payable applications and accessing them via two Xerox terminals in the Phoenix offices and contracting for Xerox's package of information center tools. These consisted of software for creating special reports not normally produced by the application programs.

The information center package includes Xerox's Reporter report writer, Definer definition package, Filer file creation and manipulation system and Control decision support system.

Every 30 days, each operating company provides its financial data sheet covering prespecified items. They include a summary profit-and-loss statement, balance sheet, depreciations taken, capital expenditures, capital expenditure commitments, various inventory levels including finished goods, income tax information and other administrative items.

"Using the two terminals in our office, we transmit the information to the Los Angeles data center. Then, from those updated files, we create four categories of reports most useful to our executive management," Palmer said. The reports are:

■ Consolidated profit-and-loss statements.



The information center software offered by Xerox Computer Services includes these management tools, plus a decision support system called Control.

■ Consolidated financial statements.

■ Operating highlights for each company, with comparisons of actuals vs. budgets for current month and year and against the prior four years.

■ A performance report that compares on a five-year basis a number of key statistics on both a company-by-company and consolidated basis. This 30- to 35-page report offers details regarding inventory levels, receivable levels, inventory turns, day sales in receivables and so on. It also presents a graphics picture of the stockholders' investment in each company vs. the return on that investment.

Talley also uses Xerox information center tools to develop subapplications for functions unique to the business. "For example, if we wanted to establish a warranty tracking system, we would use the Filer program

See TALLEY page 38

POWER TOOLS VAX PBS

■ SOFTKEY
Customize your keyboard. Redefine any key or gold sequence as a string of up to 2000 characters. Recall and edit the last 10 lines of command or program input.

■ PHOTO
Photograph and playback your terminal session. Document bugs; create mail and handouts.

■ SPY
Watch other users with or without their knowledge: real-time or recording mode. Give demos from remote sites!

■ ADVISOR
Assist other users by entering commands or program input from another terminal. Great for remote training and problem diagnosis.

CICS PRINT FACILITY

CPF

CPF now unties more knots! Release 3.0.0 is more user friendly and more efficient than the previous release. Print online or batch reports anywhere within your CICS network with greater efficiency than ever before possible. CPF makes it as easy as loosening your tie!

Standard CPF features (new functions highlighted)

FOR THE USER: Active index of all reports, security network, menu driven, *individual page print, ability to affect all reports displayed on index with one entry*, help screens, report display on terminal, print interrupt and restart, screen copy, message sending, multiple copies, multiple destinations.

FOR THE PROGRAMMER: Online Spooling, Multiple Task Spooling, Batch Spooling, *Array Mode*, Predefined Report, *Automatic ENQUEUE and DEQUEUE, Enhanced BMS Support, Direct Spooling.*

FOR THE SYSTEM ADMINISTRATOR: *Three tier security network. Unlimited number of system and domain administrators, automatic report aging, CPF control file, Sync point and recovery restart, direct spooling to CPF report data set, blocking of data from batch sources.*

CPF operates under MVS with JES 2 or JES 3, and is not release dependent upon CICS. CPF will work with BTAM, VTAM, or TCAM.

Call or write today for more information or a free 30 day trial and loosen your tie!

It is no longer enough to be IBM compatible. Not even for IBM.

It was the personal computer circus.

And it had gone on too long.

The crowd grew restless as each new act continued to perform varying degrees of IBM compatibility.

Suddenly, the crowd gasped. It was the unexpected finale—the arrival of Sperry, with a performance no one could have imagined possible.

Ladies and gentlemen, it was the Sperry PC. It ran IBM compatible software.

But that wasn't the show stopper.

Because it soon became quite clear the Sperry PC didn't just *run* the IBM programs, it ran them *better*.

Better because it ran them faster—up to 50% faster.

It ran them with breathtaking graphics, far more dramatic than the IBM PC could provide.

And it ran them from a keyboard that drew roars of approval, for it was not only easier to operate, but far more comfortable than IBM's.

And as the crowd cried out for more, that's just what Sperry gave them: the ability to plug right into a company's main computer, whether that system was IBM *or* Sperry. Or both.

As the crowd sat stunned by this final flourish, Sperry left all with a most provocative question. Was it possible that the Sperry PC could do all of this and yet cost less?

Again, the crowd gasped.

Could it be?

Come see for yourself. Hands-on, side-by-side. Call 800-547-8362, toll-free. Or write us. Sperry Corporation, Computer Systems, Department 100, P.O. Box 500, Blue Bell, PA 19424.

SPERRY PERSONAL COMPUTER SPECIFICATIONS

OPERATING SYSTEM MS DOS Version 1.25 or 2.0 with G.W. BASIC	KEYBOARD 84 keys, 6 ft. cord
MICROPROCESSOR High-Speed 16-bit 8088	AUXILIARY MEMORY Up to two internal 5¼" diskettes 10MB internal fixed disk when configured with single diskette.
DISPLAY SCREENS High Definition monochrome display IBM compatible graphics.	USER MEMORY Standard 128K bytes, expandable to 640K
COMMUNICATIONS Built-in Asynchronous	DIAGNOSTICS Power-on self test.
	CLOCK Time-of-day with battery back-up

Course to cover local nets

WYCKOFF, N.J. — "Local-Area Networks" will be the focus of a two-day course being co-presented by Dr. Ira Cotton and Dr. Marshall Abrams next month. The course will be offered April 11-12 at the Fairmont Hotel in Denver and April 24-25 at the Marriott Hotel in Orlando, Fla.

The course will address such topics as current governmental and corporate experiences with local-area networks, the major considerations in implementing them and their selection criteria, among other topics. The key local-area network interfaces and communications protocols will also be discussed.

Cotton, who is with Booz, Allen & Hamilton, Inc., was formerly the manager of local-area networks and office systems at the National Bureau of Standards (NBS). Abrams, with Mitre Corp., is a former NBS employee whose work centered on network quality and performance measurement and evaluation.

The registration fee is $690, which includes meeting materials, lunches and a cocktail reception. A discount of 15% is available for three or more employees who register as a group. Additional information is available from the Special Projects Conference Management Center, c/o Information Breakthroughs, Inc., 445 W. Main St., Wychoff, N.J. 07481.

Multinational telecommunications seminar scheduled for April 11

WASHINGTON, D.C. — A seminar to help multinational corporations best use their telecommunications facilities in the face of foreign postal, telephone and telegraph regulations and data flow barriers will be held here April 11.

The seminar, titled "Optimizing Multinational Business Telecommunications," will feature Congressman Michael Oxley (R-Ohio) of the House telecommunications subcommittee as a speaker, a conference spokesman said.

Other speakers will include Herbert E. Marks, a Washington attorney specializing in telecommunications law, and Richard G. Mills, a consultant on business telecommunications strategy development.

Also speaking will be G. Russell Pipe, editorial director of *Transnational Data Report*.

The seminar is sponsored by Transnational Data Reporting Service, Inc.

Registration for the seminar is $45, according to the conference spokesman.

More information about conference registration is available from Transnational Data Reporting Service through P.O. Box 2039, Springfield, Va. 22152.

Shared DASD users, don't leave your data integrity to chance.

Protect it with Super-MSI™,
the integrity protection package designed exclusively for multiple-CPU environments.

Easy to install. Easy to maintain. Super-MSI requires no modifications to your operating system and can be implemented in an active system in as little as ten minutes—assuring complete data integrity from the moment it is installed.

Super-MSI guarantees data integrity.
No complicated job scheduling. No elaborate control schemes. No software changes. Super-MSI spans inter-system activity to give "unified system" integrity to your entire multi-system complex.

Super-MSI preserves integrity under MVS, MVS-SE, MVS-SP, SVS, MVT, VS1 and MFT systems.

Super-MSI prevents data destruction.
Inadvertant modification, simultaneous access ....Super-MSI stops the damaging data abuses that multiply in a multi-systems environment. Prevents the errors that can so easily occur—and too often go undetected—when users operate in a multi-systems complex.

Super-MSI eliminates hardware RESERVEs.
Super-MSI completely protects your data integrity and frees your systems of RESERVEs and RESERVE lock-outs. Super-MSI converts selective RESERVEs to logical controls that securely protect your data without inhibiting system throughput.

Super-MSI does more.
As part of the CGA family of single-image software for multiple-CPU sites, Super-MSI works together with MSM®, our Multiple Systems Manager which manages tape and disk storage devices and GCD®, our Global Console Director which consolidates consoles; cutting costs and streamlining operations. The result is a unified single system image that is transparent, flexible and powerful. Use them together or in any combination, CGA's multiple systems software is a must for large users.

More than 1,000 CGA single-image software packages are in use around the world, preserving data integrity and helping multiple-CPU sites hum like they're supposed to. Call today. Set up a free trial of Super-MSI, GCD or MSM.

Speak software. Talk to CGA.

Electro/'84 set for May 15-17

BOSTON — An estimated 45,000 engineers and managers in fields from data processing to microelectronics are expected to attend the Electro/'84 conference here May 15-17.

Sponsored by the Institute of Electrical and Electronics Engineers (IEEE) and the Electronic Representatives Association, the conference will focus on active and passive electronic components, fiber optics, instrumentation and production and packaging, among other topics.

The estimated 600 exhibitors will be divided between Hynes Auditorium, which will house displays of computer hardware, peripheral assemblies, computer graphics and software; and the Bayside Exposition Center, the site of the Electro Professional Program. Exhibitors will reportedly include Data General Corp., Raytheon Data Systems Co., GTE Corp., Mitre Corp. and others.

Registration for the conference is $10 at the door for IEEE members and $20 for nonmembers. Preregistration for the conference is $5, a discount received via a coupon available by writing the sponsor. Further information is available from Electro/'84, P.O. Box 92275, Worldway Postal Center, Los Angeles, Calif. 90009.

TALLEY from page 36

to build a new data file based either on new inputs or on extractions from an existing file. And we'd use Reporter to design the desired report," Palmer said.

Definer allows users to define the contents and formats of special files, of records within those files and of fields within those records, Palmer said. "It lets us list the definitions for those files all without knowing anything about bits or bytes," he said.

Control uses an English language dialog and offers a library of 17 report formats and a custom-designed report facility, Palmer said. "But the major distinguishing features of Control are its capabilities to construct and exercise business and financial models," he said. "It lets us do all sorts of planning and analytical tasks."

"The computer is down."

Every day another business goes "on line." Every day the world becomes more dependent on computers. And every day it becomes more important for the world to have a computer that won't go down, or even skip a heartbeat.

Over the past decade there have been computers designed to withstand hardware failures and eliminate downtime. However, all previous approaches depend heavily on software techniques to provide fault tolerance. A comparison of these old systems with the new Stratus/32 Continuous Processing™ System will illustrate how far we have come in one leap, by using advanced hardware technology instead of complex software.

How the Stratus Hardware Solution Supersedes the Software Solutions.

Stratus's hardware design means that fault tolerance is invisible to your application programs and users. You can even move previously developed applications to Stratus with NO CHANGES and NO PERFORMANCE LOSS for fault tolerance. In contrast, the software-based systems require complex, performance-stealing software in order to implement fault tolerance. This means that new programs are more difficult to develop, they run slower, and existing programs can't be run without major changes.

An added benefit of the Stratus fault tolerant design is that you can expand your system with additional processors as your computing needs grow. In fact, you can have up to 32 fault tolerant processors, 2000 communication lines, and 100 billion bytes of storage in a single Stratus system.

Hardware Self-checking Causes a Breakthrough in Service.

Each Stratus/32 tests itself EIGHT MILLION TIMES A SECOND while it executes your programs, so faults are detected BEFORE they corrupt your data. And when there is a failure, there's no need to rush to call your Stratus service technician. For one thing, the failed component, be it a CPU, controller, disk, or power supply, has a partner that continues operations as usual (without slowing down the system), so there's NO DOWNTIME. In addition, repairs can be made WITHOUT STOPPING THE SYSTEM. It is so easy to repair a Stratus/32 that our service is provided at about one-half the average price charged by other computer manufacturers.

$140,000, Software Included.

Our prices are competitive with "normal" systems (i.e. ones that do not provide fault tolerance), and substantially lower than the software-based fault tolerant systems. $140,000 buys you a complete four megabyte 32-bit system with 60 megabytes of disk storage, magnetic tape drive, and system SOFTWARE. If you like our hardware, you will be even more impressed with our software. (A common reaction among our users.) Briefly, our software offering includes VOS (a virtual operating system), transaction processing, networking, IBM communications, data management system, interactive forms builder, symbolic debugger, COBOL, Basic, PL/I, Fortran, Pascal, word processing...

To get more information call us at 617-653-1466.

The computer you can count on has arrived.

Manufacturer fine tunes planning with MRP system

OBERLIN, Ohio — After outgrowing a software system developed in-house and struggling for two years with a packaged system that created more confusion than it resolved, Gilford Instrument Laboratories, Inc. needed a new manufacturing resources planning (MRP) system.

Gilford, a subsidiary of Corning Glass Works, manufactures research and clinical instrumentation needed to identify biochemical examples. It has built an international reputation on the precision of its instruments. Unfortunately, in planning and controlling its production line, that same sense of precision was missing.

The company first implemented an MRP package when it became apparent that it needed a more versatile system than the one Gilford's own staff had developed in-house. Gilford operated with the package for two years, but planners felt they never really got the capabilities they needed. Inventory levels continued to rise, visibility to the shop floor was poor and work scheduling remained tied to "hot lists."

"Everybody dreaded the end of the month," recalled Dave Morrison, Gilford's production control manager. "Even though we had this formal system in place, there was no discipline in using it. We were still running the shop by an informal system out of little black books kept in shirt pockets. Every month closed with a rush to fulfill shipping quotas."

Inventory items

Gilford needed a system that could keep track of its more than 17,000 inventory items and schedule and track the 1,500 assemblies that pass through the production line.

After management reviewed several MRP packages, Gilford chose Management Science America, Inc.'s (MSA) Manufacturing System software.

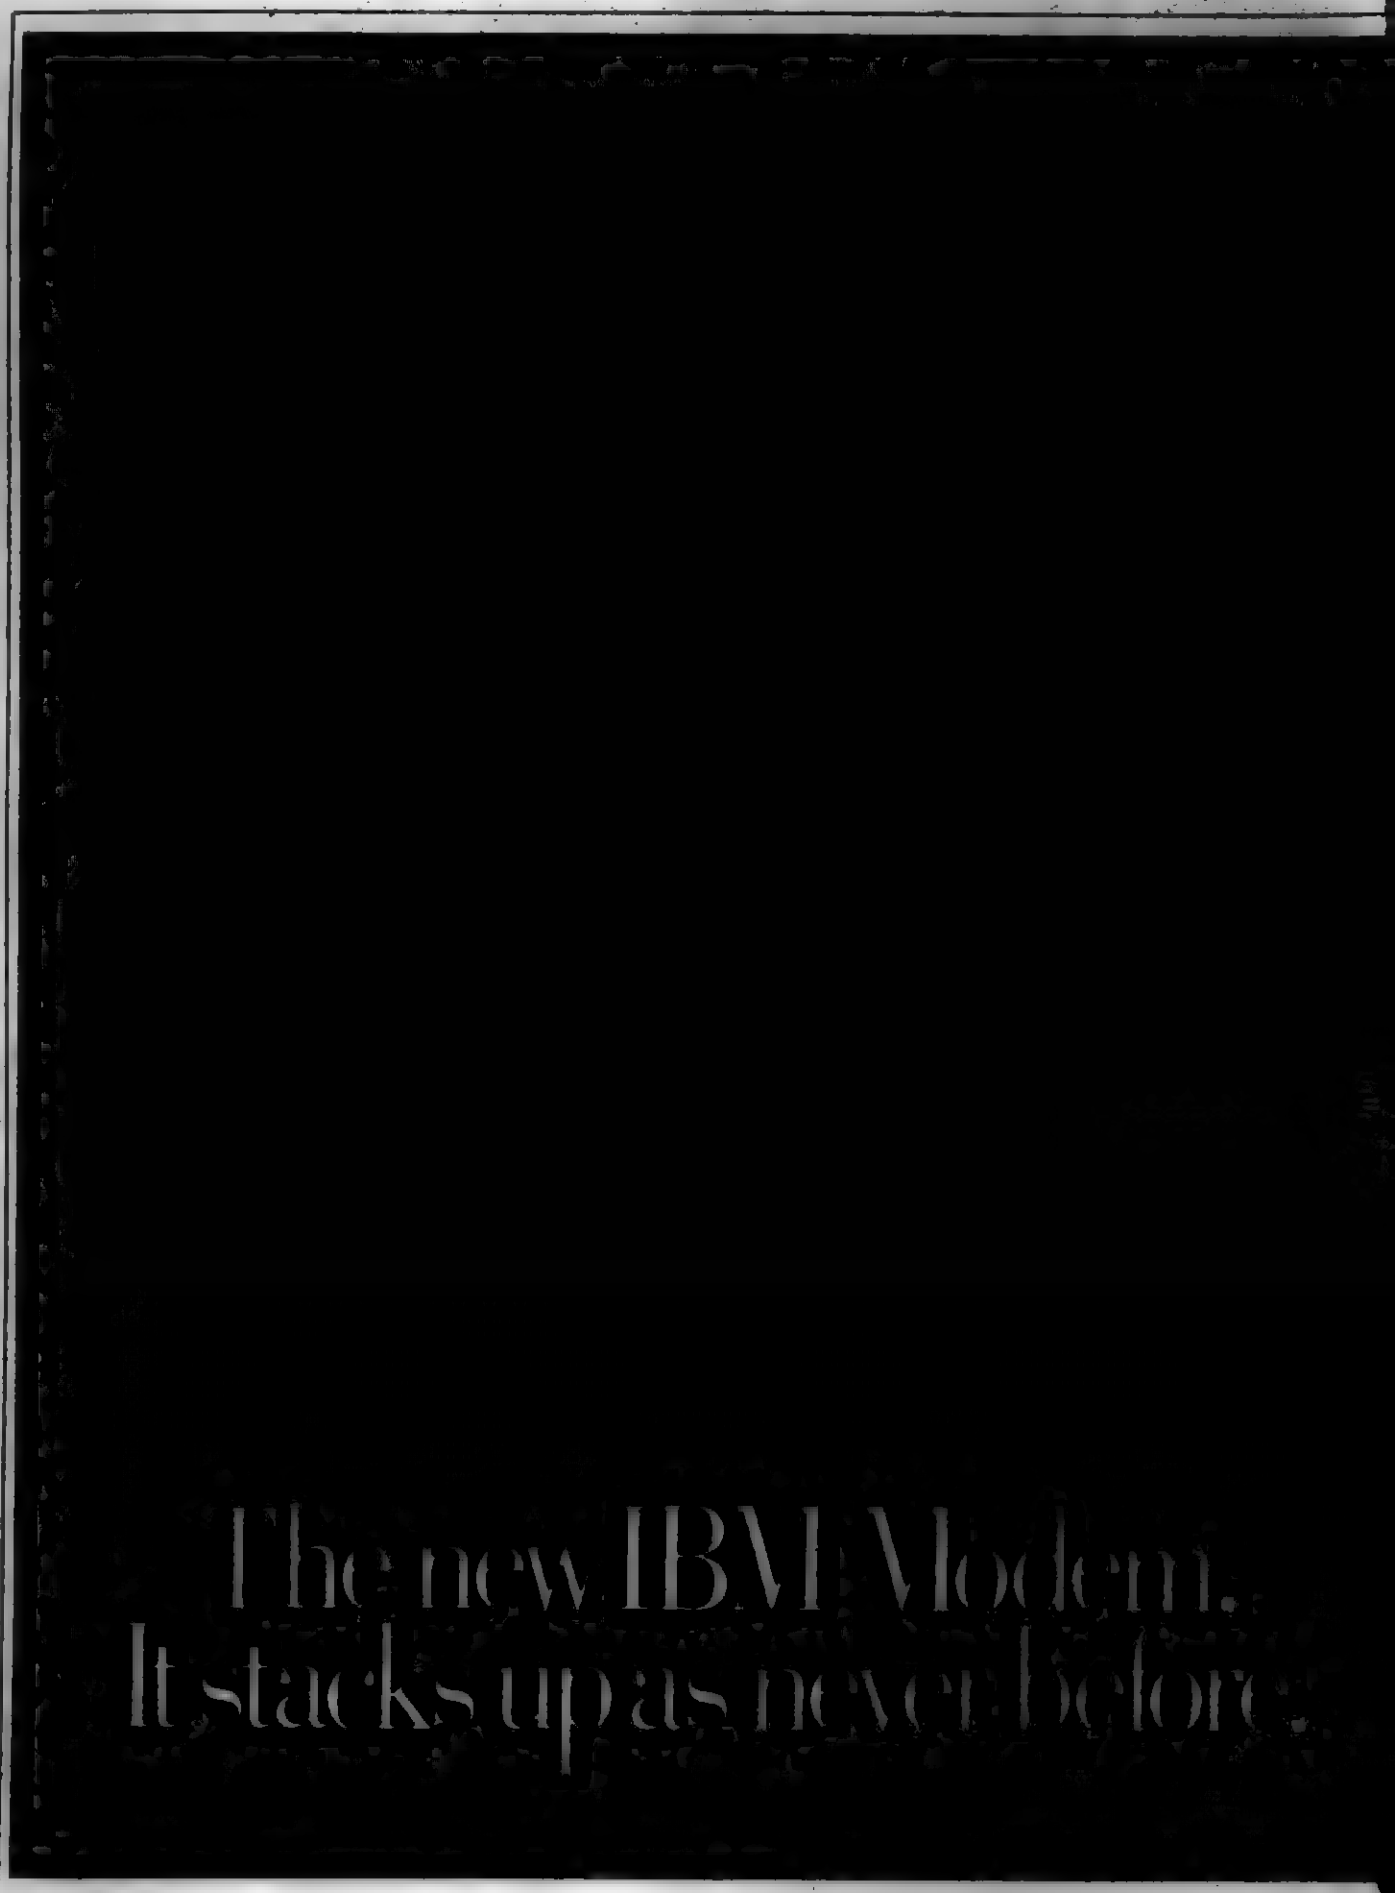
Having been involved in MRP implementations in the past, Morrison was chosen as project leader for the implementation of the MSA package on Gilford's new IBM 4300 series mainframe.

Gilford had chosen the IBM hardware in order to be compatible with the 4300 series equipment at Corning's Medfield, Mass., facility, which serves as headquarters for the corporation's Medical Products Division. MSA's Manufacturing System had also been successfully implemented at several other Corning facilities, Morrison said.

"What impressed us was the MSA Master Production Scheduling module," said James Sutorus, director of management information systems at Gilford. "Our old system was very crude. There was no time-phased schedule, and it wasn't sophisticated enough to tell the supervisors on the shop floor what they needed. They couldn't see what was coming at them down the road.

"We established a very aggressive schedule for full implementation of the MSA package," Sutorus continued. "We decided we were going to put six modules up and have them ready for operation within three months. In December 1982, we received shipment of the software, and by the last day of the year, we had the test data base up and running. In the middle of March we went live, and we've been relying completely on the package since then."

With the MSA system, according to Sutorus, all manufacturing orders to be released to the floor are time-phased, giving management the control it needs to determine when changes in the schedule are no longer cost-effective. Material planners also gained visibility into what was happening on the shop floor. Through shop order status, they can now "see" how an order is actually moving through the plant.



Firm's DSS consolidates data from five subsidiaries

For developing corporate plan dealing with different business levels

STAMFORD Conn. — An energy, cement, iron and coal conglomerate here found itself faced with a problem in 1980 when it began developing corporate plans.

It had to consolidate information from five subsidiaries to come up with a five-year corporate plan, a two-year profit plan for individual products, annual reports for each subsidiary and the parent company and quarterly forecasts that tracked performance against the two-year plan.

"At each level of the business, we were dealing with different processes: several time-sharing services and manual procedures," recalled Andrew Langlois, director of MIS at Moore McCormack Resources, Inc. "Subsidiary planning often would be done manually and figures would then be entered again for the corporate planning model. We were running up significant time-sharing charges, and there were inconsistencies in the models used by the different subsidiaries."

These problems clarified the need for a single, in-house decision support system (DSS). Subsidiary and parent company personnel identified 124 individual modeling and planning capabilities that were used or needed. These specifications were sent to 10 DSS vendors, who responded by indicating features their products offered.

Vendors were then asked to demonstrate their products to corporate users. The user group compared the software packages' ease of use, capabilities and price. The MIS department analyzed the compatibility of the products with its one IBM 3031 and two 4300 series mainframes running in the MVS operating environment.

At the end of the study, Moore McCormack Resources selected PCS-EPS from EPS, Inc. of Windham, N.H. Initially, long-range profit planning and forecasting systems were developed. Applications for departmental budgeting, subsidiary operational planning, economic forecasting and pension plan analysis followed.

Significant savings

"At last, we had a single DSS with a group of 24 to 30 people trained in its use and a variety of well-developed, stable models," Langlois said. "We experienced significant savings over external time-sharing — over $100,000 and probably closer to $150,000 a year. But just as we became comfortable with the product, in came the micros."

As IBM Personal Computers invaded Moore McCormack, MIS had to revise its strategy. Moore McCormack added a help desk, which aids users by testing new products, introducing new software, solving problems and providing DSS support. Approved forecasting software used by the company includes PCS-EPS for solving large problems on the mainframe, EPS' Micro-PCS for complex financial problem solving and Lotus Development Corp.'s Lotus 1-2-3 for most problem solving needs.

"Most users' requirements are filled by Lotus," Langlois said, "but there are a number of functions and capabilities that run on the mainframe which just can't be completed on a microcomputer. For complicated forecasts, a user will use PCS."

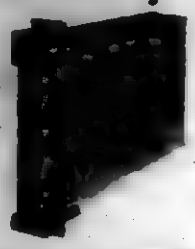
Langlois said the advantages of the current strategy are common tools, trained users at all locations and lower costs. "By incorporating Lotus 1-2-3 and Micro-PCS together, our former nucleus of 24 hard-core decision support users has expanded to 75 to 100 people."

The new rack-mounted IBM 3868 Modem saves you space. And money. And effort.

Space, because IBM's new one-inch-wide vertical package allows you to mount up to 12 modems in one enclosure that fits a standard 19-inch rack.

Money, because each enclosure needs only one power supply and cooling system to support all of its modems.

And you manage your network with less effort because the IBM 3868 Modem has the same high availability and rock-steady reliability as other modems in the 386X Series—plus an enhanced Link Problem Determination Aid (LPDA).



Working with software available for many IBM host systems, the LPDA performs greater end-to-end management. Now line conditions are identified further downstream from the host, and in more detail. For example, conditions in any multi-point circuit can be pinpointed to a particular leg, including tailed configurations off multi-plexed links.

In fact, to help you keep your network humming, the LPDA and host software monitor and provide you with a line quality value, a receive signal level, an error-to-traffic ratio and modem self-test results to help you isolate line problems. Now you can more precisely communicate them to your communications carrier.

And because the 3868 Modem is so reliable, it's backed by a full three-year warranty.

Try them for up to four weeks; just select 2400, 4800 or 9600 bps line speeds. If you purchase in quantity, discounts are available.

To get your copy of a free brochure, or to arrange to have an IBM representative contact you, call toll-free, 1 800 IBM-2468, ext. 90. Call your IBM representative or return the coupon.

It's just not fair to claim that TEMPLATE® is the best graphics software available. Our competition's already discouraged.

And we like competition. We really do. It's just that it's difficult, if not impossible, to find graphics software as efficient and functional as TEMPLATE. Try as you might. TEMPLATE is the hands-down winner. With true device-independence and intelligence, total graphics functionality for CAD, scientific analysis, seismic work, process control, molecular modelling, and a host of other applications.

In almost any environment, whether it's batch or interactive, 2D or 3D, TEMPLATE wins. Benchmark tests prove it. TEMPLATE, besides being a true 3D graphics package for 32-bit or larger computers, features powerful commands that provide matchless productivity. TEMPLATE makes optimal use of available computer resources, giving you fast, efficient computer graphics program execution. And it supports over 125 graphics devices, from dumb terminals to sophisticated systems.

We also provide on-site installation and training, continuous updates, a regular flow of new device drivers, and ongoing documentation. What's more, we back you up with a telephone hotline so TEMPLATE software specialists can provide help if you need it.

But let's be fair. If you're looking for graphics software, call our competitors first. Find out what they have to say about theirs. Then call us, and find out why TEMPLATE really has no competition.

And why the competition has been so discouraged for so long.

Info management system hems firm's paperwork

TORRANCE, Calif. — Just as an elaborately detailed pattern is woven into a fabric, so must the design of an information resource management system be interwoven throughout a corporation's day-to-day business operation.

While that may sound poetic, the parallels are quite evident at S. Harris & Co. here, the oldest fabric and wall-covering distributor in the West. In early 1980, Harris decided it had two options: either pull back and economize its operations or else take an aggressive stance and position itself for the post-recession period. It opted to go the latter route in order to stay competitive.

The manual inventory and accounting systems of the 77-year-old firm were unable to support the company's daily business objectives.

"We knew we had a problem when it started taking us three days out of every month just to age our receivables," recalled Bill Crawford, Harris' executive vice-president, noting that, while overtime became "a fact of life," Harris was still swamped with paperwork.

This spurred Harris to retain the consulting services of Michael R. Wood, president of Helix Corp., to plan and design an automated information system for Harris using the corporation's Helix Methodology. Key to this methodology is Helix's approach to the selection and implementation of automated information systems, which incorporates the disciplines of management, behavioral science and organizational and systems theory, according to Wood.

"We selected the Helix Methodology because it is the only approach that integrates such dynamic [humanistic] planning techniques into the development process," Crawford said.

Helix's first step was to find out the impact that new information systems would have on the company and its employees. Harris employees, from clerical on up to top management, all gave their input on how they thought the systems could work best in their particular departments, detailing the changes they wanted to see included in the new systems. Once it became clear to the employees that they would be playing an active role in the system's design, their anxiety and fear slowly disappeared.

As a result of user involvement, Harris was able to identify the major goals necessary to support the corporate objective of same-day shipment of 95% of all orders. The goals included the ability to update inventory files to reflect immediately the impact of a customer's order; to retrieve a customer's order during a two- to three-minute telephone inquiry; to produce a variety of sales reports based on pattern, color and yards sold; to monitor sales by salesman and territory; to check all sales and purchasing activity related to any given pattern or color; and to produce a daily stock alert report and a back-order report that would assist in the purchasing function.

Next, Helix selected several vendors for Harris' consideration. Interactive, Inc., a software writer and turnkey vendor, was chosen because Harris felt it was the most flexible and mature of the bidders. Interactive chose Ultimate Corp.'s Ultimate operating system, which is based on Pick Associates, Inc.'s Pick operating system, to run on a Honeywell, Inc. Level 6 minicomputer, using Interactive's proprietary application software.

In July 1982, Harris installed 21 Volker-Craig, Inc. CRT terminals, a 600 line/min Printronix, Inc. printer and two 125 char./sec Texas Instruments, Inc. printers. The Interactive

IBM selects Management Decision Systems as value added remarketer for IBM 4300 with EXPRESS®.

IBM has selected Management Decision Systems, with its industry-standard decision support software EXPRESS, as a Value Added Remarketer for IBM's 4300 computer family. The agreement enables Management Decision Systems to package its powerful decision support software with IBM's 4300 series. Now, it is easier than ever before for major corporations to meet the increasingly critical need for integrated planning and analysis.

Offering you the total decision support solution, Management Decision Systems' EXPRESS combines data base management with extensive analysis, reporting, graphics, and statistics capabilities. Backed by quality installation, training, and customer support services, EXPRESS meets all your needs for applications development and micro-mainframe integration.

With this new agreement, there has never been a better time to use the best available information technologies as your unique strategic weapon in today's world of data overload. Put the power of the IBM 4300 and Management Decision Systems on your side—and develop the winning edge.

Management Decision Systems + IBM 4300 = the total decision support solution.

TI researcher to get IEEE award at Compcon Fall '84

SILVER SPRING, Md. — Harvey Cragon, senior fellow in computer research at Texas Instruments, Inc. will receive the Emanuel R. Piore Award of the Computer Society of the Institute of Electrical and Electronics Engineers, Inc. (IEEE) at the organization's Compcon Fall '84 conference, which will be held Sept. 16-20.

Cragon will receive the award for his "creative contribution and leadership in uniting computer architecture with inherent capabilities of integrated circuits," according to an IEEE representative.

Cragon worked on the first integrated circuit computer, delivered to the Air Force in 1961, and was a major contributor on the TI Advanced Scientific Computer, according to Prof. Ned Cornfield, a member of the committee that chose Cragon for the award.

The award, established in 1976 through an agreement between IBM and the IEEE Foundation, Inc., consists of a bronze medal, a certificate, $2,000 and a $2,500 international travel grant.

Compcon Fall '84 will be held at the Hyatt Regency Crystal City Hotel in Arlington, Va. Its theme is the "Small Computer (R)Evolution."

The registration fee is $125 for members and $150 for nonmembers.

The conference registration deadline is Sept. 2, after which conference registration costs will rise approximately 5%.

Registration can be made through Compcon Fall '84, P.O. Box 639, Silver Spring, Md. 20901.

HARRIS from page 43

software has a response time of less than one second for 90% of those entries.

Training was minimal because of user involvement and hands-on experience during the planning phase. Harris even felt confident enough not to install a DP department.

"We trained one of our own people to be our troubleshooter," Crawford explained. "With no prior computer experience, she now handles about 80% of the equipment-related problems that arise." Interactive takes the other 20%.

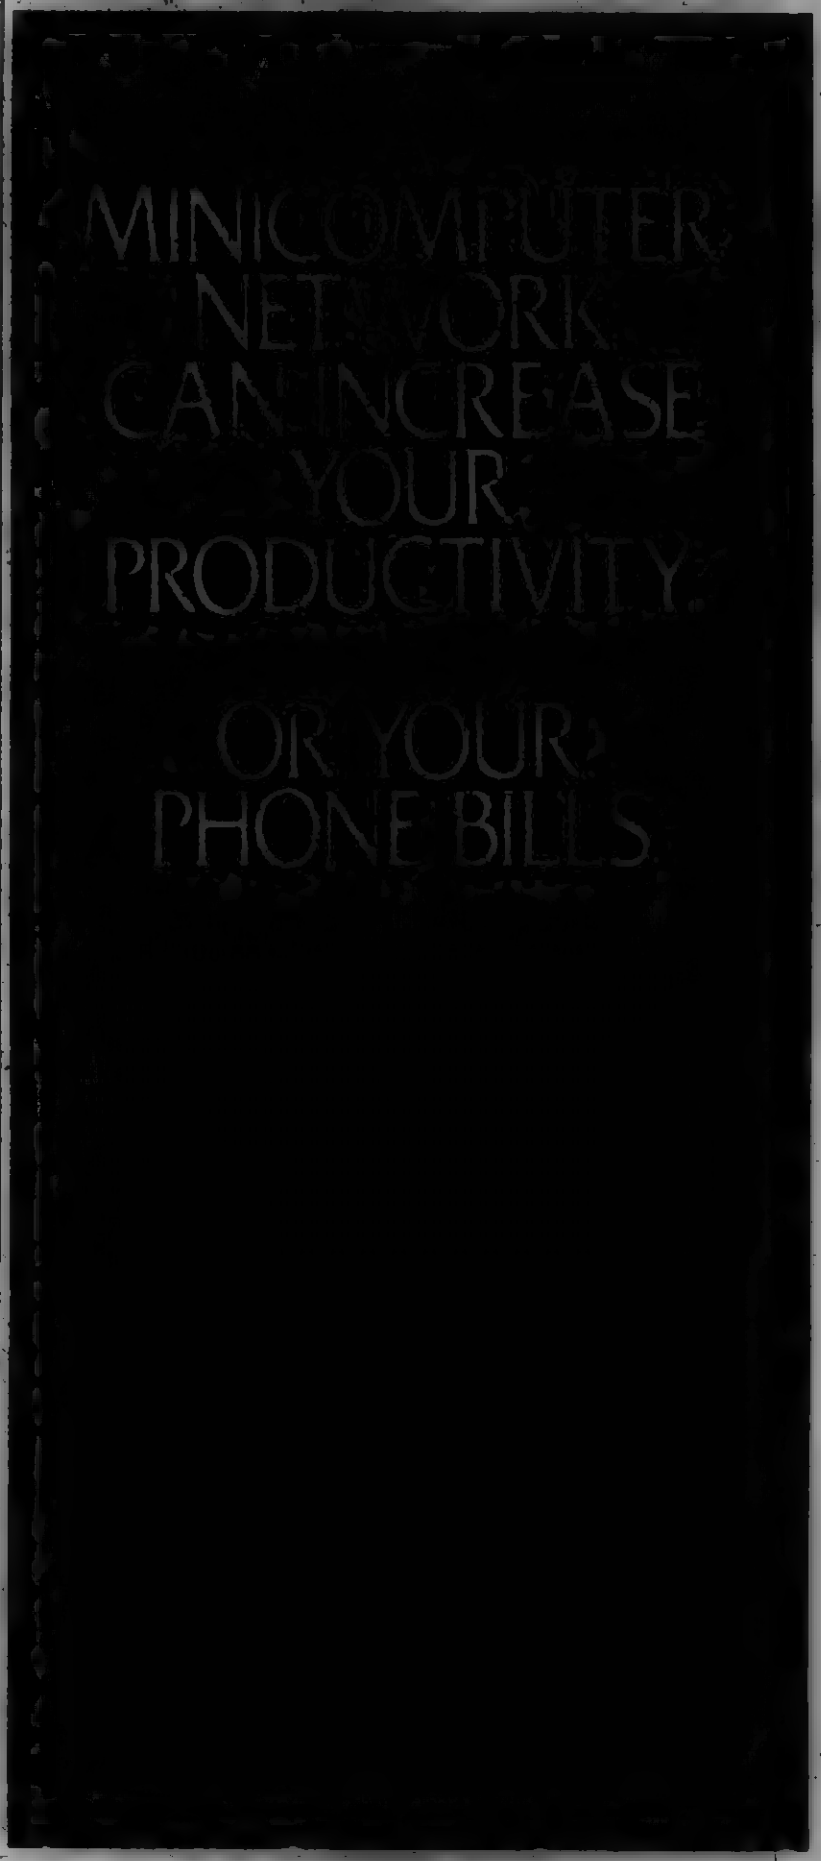
The company decided not to maintain its old manual system on a parallel basis while implementing the new system. The firm felt its employees would learn, accept and use the new system faster if they didn't have the old one to rely on.

Also, running two systems at the same time was cost-prohibitive. Because of the planning, it took only three days to transfer the entire 25,000-item inventory onto the new system.

Before the changeover, there was an eight- to 48-hour gap from the time an order was taken to the time inventory was updated. The company has now reached its goal of 95% same-day shipment service, and Harris is now able to handle three times the volume of orders with less manpower. Overtime is a thing of the past — through attrition, Harris has been able to cut its work force without overburdening those who remain.

"We expect to save over $25,000 this year in overtime expenses alone," Crawford said.

Harris believes the key reason its information resource management system is running so successfully is the company's ability to plan for any potential future data base requirements properly. "You have to think in terms of broad goals when planning for a new information system," Crawford said. "We are now at the threshold of reaching many of our goals. The planning and preparation took a relatively short period of time. When you see the results of proper planning, you realize it's the only way to go."



Most companies experience the same thing when they start tying remote terminals to their minicomputer.

Much higher phone bills.

But now there's an inexpensive solution to that costly problem: The new Codex 6002 Intelligent Network Proposesor.

This low-cost multiplexer will save you money even if you're using as few as two terminals. The 6002 boosts operating efficiency, reduces the number of needed lines and protects data from errors due to line disturbances. And it can handle any mix of up to 16 asychronous "terminals", including graphics terminal., word processors and personal computers from virtually any manufacturer.

Plus, only with the 6002 can you add asychronous equipment without worrying if your multiplexer is compatible or not. So not only will it save you money now, but also later as your network grows and grows.

The Codex 6002 Intelligent Network Processor. It's just one of our many products that enable minicomputer users to develop and efficiently manage a growing network.

To learn more about the 6002, call 1-800-821-7700, ext. 892. Or write: Codex Corporation, Dept. 707-92, 20 Cabot Boulevard, Mansfield, MA 02048.

Automated office helps firm customize client data

CHICAGO — Conversion to an automated office meant that people "who had never seen a computer before" increased productivity and made higher quality reports and presentations to clients of SEI Corp.'s Funds Evaluation Division.

The division was formed in 1965 as the nation's first organization to provide performance evaluation and consulting services to corporate pension plan sponsors and institutional money managers. But to do so, a 1980 internal study found, client representatives spent a considerable amount of time manually customizing information for clients in the form of text, graphs, tabular data and special studies.

The Funds Evaluation Division has 250 employees handling 1,500 clients. To improve productivity, it launched plans to develop an automated office, vice-president for Product Design Mirella Shannon said.

At that time, the parent company of the division was A.G. Becker Paribas, Inc. Becker completed a separate automation research project and recommended selection of Wang Laboratories, Inc. word-processing systems.

The division installed a Wang Office Information System (OIS) 140 Model I — later upgraded to a Model III — in its Chicago office. It also installed an OIS 130-A in New York, OIS 115-2s in San Francisco, Los Angeles, Atlanta and Toronto and Wangwriters in Boston and Philadelphia.

In the first phase of implementation, personnel were trained and existing operations automated over a 12-month transition period. In the second phase, the computing, programming and telecommunications capabilities of the system were implemented. The systems were used to calculate internal and time-weighted rates previously determined by using desk calculators. Basic programming was used to develop prototype fund performance measurements, such as attribution analyses.

Also, a computerized data base containing information on more than 300 fund managers was developed for use in searches.

The systems are capable of communicating with each other and are equipped with IBM 2780/3780 and 3270 protocols for batch and on-line communication with IBM 3032 and Amdahl Corp. 470V/8 mainframes in Becker's data center, which SEI uses as a service bureau. Multifunctional Wang 5536-4 workstations are used as IBM 3270 terminals.

The division designed an interface between the OIS systems and a Xerox Corp. 9700 laser printer in the data center. The interface capability and a Wang list-processing capability are used to send quarterly seven-page letters to clients, providing summaries of fund performances.

The final phase of implementation involved development of a new client reporting system.

Although report production had been automated and accelerated in earlier phases, the documents were still providing only summary data. That meant that representatives were spending time analyzing and interpreting data and preparing additional reports and letters for clients.

Therefore, the division developed a mainframe program to prepare quarterly textual analysis of individual fund performance data automatically in the form of letters 20 pages or more in length.

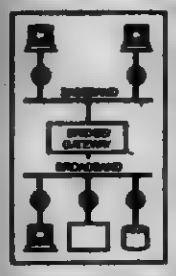
"The program composes the letters, which are customized and have the capacity for infinite variation, based on fund performance data," Shannon said. "The key result is an executive summary that provides more thorough, accurate, up-to-date and standardized information in the form of both written analyses and detailed graphics."

LAN.
THE DECISION TO WAIT AND SEE JUST PAID OFF.

Now there is a company that can satisfy your LAN needs both today and ten years from today. A company with flexible solutions backed by over 20 years of networking experience.

Codex.

In the 4000 Series LAN, we offer a system that lets you configure and control the precise mix of LAN technologies that suit your company needs.



A system, for example, that lets you combine a broadband backbone for data, video and voice applications; and less expensive Ethernet baseband feeders to support individual work areas.

A system that supports a wide array of industry standard interfaces. So you can connect practically any vendor's equipment.

Later, when your needs for internetworking and network management expand, those needs can best be met by the company that has literally written the book on adaptive routing, network management, protocol intervention, and statistical multiplexing.

Codex.

We just made the decision to get into local area networking a safe decision to make.

For more information, call 1-800-621-7700, ext. 879. Or write: Codex Corporation, Dept. 707-79, 20 Cabot Boulevard, Mansfield, MA 02048.

TELEVIDEO'S 970: GET IN ON THE ANSI BOOM.

The TeleVideo 970 Terminal. The computer professionals' most powerful way to utilize the advantages of ANSI X3.64 code structure.

The 970's 16 non-volatile function keys (shiftable to 32) literally automate ANSI code command entry. Other features include VT-100 compatibility, block mode operation, 32 non-embedded visual attributes and a reconfigurable keyboard. An RS-232 printer port with built-in buffer is standard.

For operator comfort, the 970 keyboard offers a naturally contoured palm rest and sculpted keys, and non-glare 14-inch tiltable screen. You can utilize either the 80 column format, with 3 pages of memory, or 132 columns with 2 pages.

The 970. A combination of power, ease of use and TeleVideo reliability at a time you need it most. The ANSI boom is here. Get in on it with the TeleVideo 970.

Dasd tool cuts retailer's need for additional storage

KANSAS CITY, Kan. — Montgomery Ward and Co.'s data center here, one of four across the country, discovered it could do without an additional mass storage system after obtaining a data set residency management system that automated the management and contents of its direct access storage devices (Dasd).

The center operates IBM 3033 and 370/168 systems, running under the MVS JES3 operating system. On-line storage is provided with 48 IBM 3350 Winchester drives and 12 IBM 3330 Model 11 rigid disk drives, which are hooked to a 3850 B2 mass storage system.

Before obtaining a new Dasd management system, center personnel "had to clear the pack on a data set level using the IBM utilities, or dump the whole pack onto tape and restore [it] to another disk drive," according to Bob Dwyer, systems software specialist. "To do that, we needed a free pack to restore it. With DMS/OS, it is a much faster, much cleaner method, and I don't have to have a spare pack sitting out there just spinning and doing nothing."

About 1¼ years ago, the center obtained Sterling Software Marketing's data set residency management system (DMS/OS), which Dwyer said has performed better than expected.

System order canceled

He first learned of DMS/OS at a Sterling seminar, and after he discussed the product with Montgomery Ward's corporate DP cadre, the company decided to evaluate the product. An IBM 3850 B2 mass storage system had been on order, but he subsequently recommended that the order be canceled, and the center has "gained back" two disk packs formerly committed to restoring.

He continued, "One of the most helpful capabilities of DMS/OS is that you can clear a pack quickly in a critical situation. When you have a pack out there that is taking some temporary hits, for example permanent read errors, and you want to get off that spindle so your customer engineer can work with it, it is just super to be able to hit the pack with the Vsam support, move the Vsam, hit the pack with the Volume Configurator and move everything else to a string of packs.

"It's very quick. You don't have to sweat, and DMS/OS has taken care of the cataloging for you," he added.

Much of the regained space, according to Dwyer, was attributed to the Vsam Support feature of DMS/OS: "The big thing is being able to move Vsam around and get rid of some of my sub-allocated space and create the data sets as unique. I then know exactly what I have out there so I don't have to come up with a figure arbitrarily on how much space I'm going to need in the sub-allocated space to put my data sets in. Now, I can treat it almost like a sequential data set because I can look at my maps and see how much space a data set is taking up instead of going through the Idcams listing and looking at the relative byte address, which is really a very slow method of figuring out how much I am using.

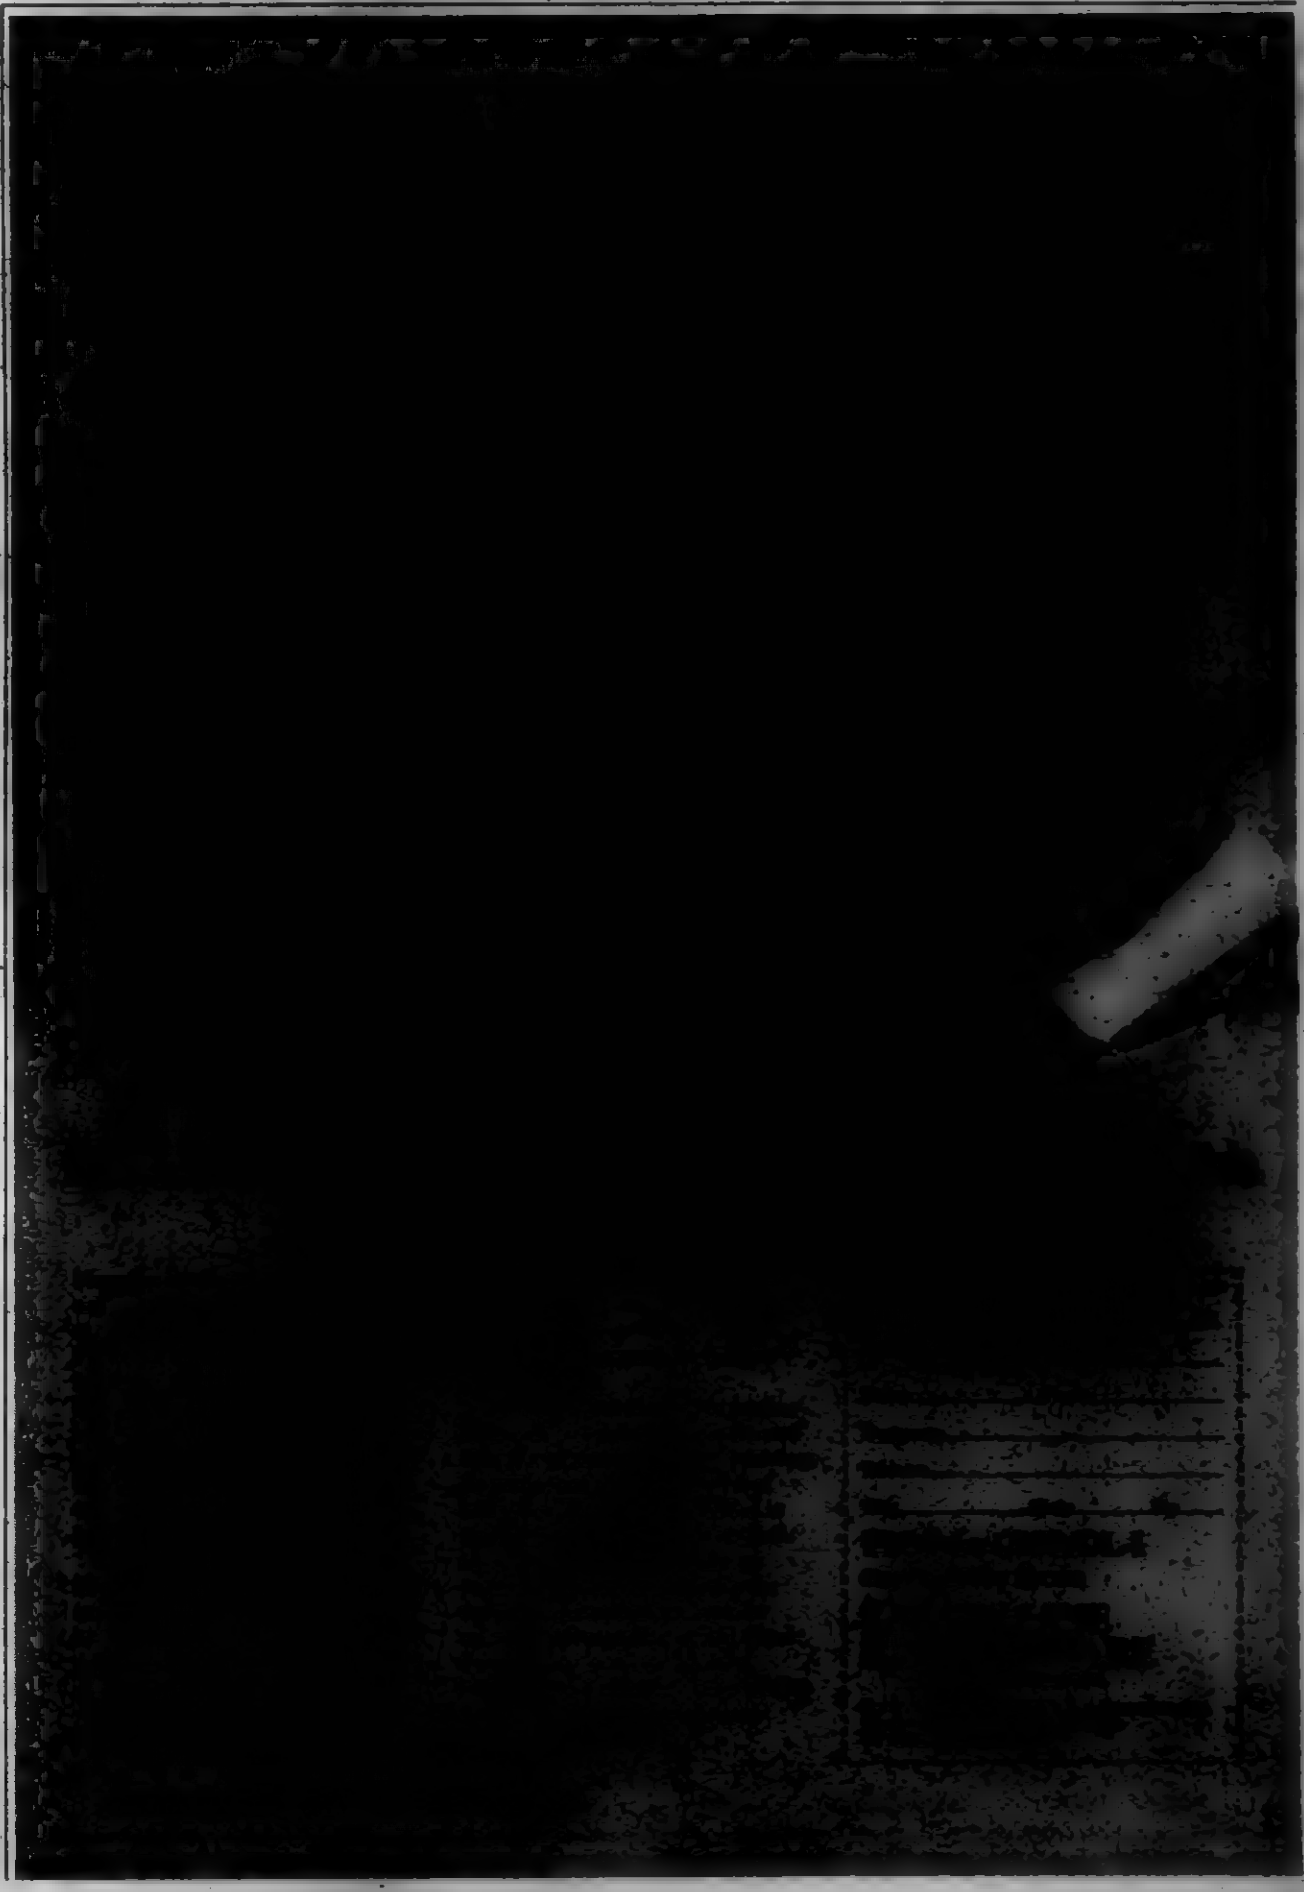
"I can't say enough about DMS/OS' ability to move Vsam data sets. . . . IBM's Export method was very slow and was done cautiously."

Dwyer was also pleased with the new System Productivity Facility (SPF)/Menu Selectable Unit of DMS/OS.

"I moved a lot of Vsam with the SPF option, which meant that I could sit right here in my chair and still get the job done.

"Without SPF, it would be a little tougher because you are dealing with building control cards," he said. "DMS/OS' method of building control cards is simple, but the SPF option takes the guesswork out of it. You get the TSO/SPF panel screen,

See DASD page 50



NEWS

Time short for public schools' system implementation

CLEVELAND — The Cleveland public school system didn't have much time to learn the best method of implementing a new computer system. "The school department decided last April to install a new system using IBM Personal Computers in each school. The scheduling and attendance applications had to be working when school opened in the fall," said Roberta Settles, administrative assistant for automation for the Cleveland public schools.

Previously, Cleveland schools used a system dependent on the city's IBM 3033 mainframe. "They wanted a decentralized system so each school could control its own attendance and grading," Settles said. "Administrators often had to wait for reports to be produced."

Pentamation Enterprises, Inc., in Bethlehem, Pa., was awarded a $1.7 million, three-year contract to tailor each school's scheduling, attendance and grading applications. "When we designed the system, it had to meet Cleveland public schools' needs," said Daniel Knerr, divisional manager for Pentamation. "Each school district has a distinct way of completing its daily attendance, scheduling and grading. We were on very tight deadline."

New experience for Pentamation

Pentamation's software is used by approximately 300 school districts. But working with a district the size of the Cleveland public school system — 78,000 students — was a new experience for Pentamation.

A training program had to be developed and implemented when Settles was hired in May. "To train Cleveland school personnel, we brought our people to Cleveland and held training sessions in each school," Knerr said. "We limited the training sessions to small groups. There were a few problems, but training was completed during the summer."

The tight deadlines were blamed for problems with the system when school opened last fall. Administrators complained about a lack of training and support.

"The people who did not use a computer before followed instructions more closely than those who were familiar with computers," Knerr said. "We sent one employee to Cleveland to answer any questions or problems an administrator had with the system."

Questions were raised about the vendor selection process. In April, the school board voted by a 5:2 margin to use the Pentamation system in its 42 junior high schools and high schools. Since Superintendent Frederick D. Holliday had used the system in two other school systems, Pentamation was awarded the contract without competitive bidding.

Today, with the Personal Computers in place, each school can produce its own reports. Reports for the entire school system require that each school transmit its data to the city's 3033. The city's mainframe then sends the data to Pentamation's host system, which consists of an IBM 4341 and two Magnuson Computer Systems, Inc. M80 computers. Data is sent back to the Cleveland school system.

Pentamation is in the process of enhancing the system. "We have a new release that some of the districts are using," Knerr said. "It has enhancements to the grade reporting and daily attendance software.

"Some administrators have asked that we add word processing and other personal computer capabilities. These enhancements will be available in the future," according to Knerr.

DASD from page 49

and it is very simple to tell DMS/OS what you want to do, which you can simulate or go in live mode. It gives you that option; otherwise, you have to bring up the Job Control Language and build your control cards. Instead, DMS/OS asks you what you want to do. You can forget about that type of function because you have it on the screen."

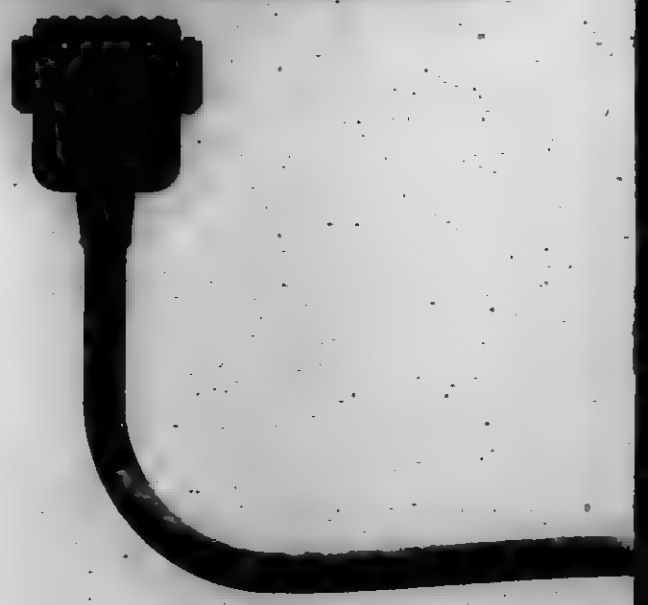
Need for 'stand-alone restore'

Sterling Software Marketing addressed initial shortcomings through enhanced releases, adding multivolume Vsam with the latest version, Dwyer said. One remaining shortcoming, he said, is the need for "stand-alone restore so we don't have to maintain two sets" of backup.

Dwyer has an additional need — the support of multivolume sequential data — that probably won't be addressed, "probably rightly so," he said; the product will not restore to more than one device.

After attending a DMS/OS seminar, Dwyer discussed it during a field managers' meeting, which included managers from all of the Montgomery Ward data centers. He was assigned the task of benchmarking it here, and a copy was sent to the Chicago corporate site. As a result, Montgomery Ward purchased DMS/OS for three sites, with the justification it would eliminate the need for a 3085 B2 at each site.

NOW CCA'S MODEL 204 DBMS CAN DO SOMETHING EVERY EXECUTIVE CAN APPRECIATE.



NEWS

OA system helps city, police grapple with crime stats

WASHINGTON, D.C. — A limited office automation system is helping this city's Office of Criminal Justice Plans and Analysis quickly generate reports on crime, repeat offenders and police finances, among other topics.

The OA system also permits that office to produce in one day the city's annual report on offenses and arrests, something that once took a full year's worth of effort, according to Robert Lester, the agency's assistant director.

Included in the system are a Sony Communications Products Co. SMC-70 microcomputer and Series 35 word processor, a Sony daisywheel printer and dot matrix printer and two Sony portable word processing units called Typecorders.

The system also includes a Hewlett-Packard Co. HP 7470A two-pen plotter and a Corvus Systems, Inc. Corvus 6MB 6M-byte Winchester disk storage unit.

Statistics and other data from the city's criminal justice agencies are entered into the SMC-70, stored on 3½-in. diskettes and retrieved using the latest version of Condor Corp.'s Data Base Management System.

City agencies that provide data to the Office of Criminal Justice Plans and Analysis include the police department, corrections department, parole board, prosecutor's office, courts and a service agency that reports on suspects' pretrial status.

That data becomes the basis for the office's reports, which research such questions as which parts of the city have the highest crime or what percentage of arrests have resulted in convictions.

The agency, a branch of the mayor's office, was always able to do those studies, Lester reported, but had to spend much more time producing them when using the police department's mainframe computer. Now, he said, many more reports will be produced than before.

The microcomputer, he said, "enables people to be aware of the month-to-month changes [in crime data] much more accurately."

Final drafts of reports are written on the office's Sony System 35 word processor, which receives data and tables from the SMC-70 over office phone lines.

The charts and graphs produced by the SMC-70, using Redding Group, Inc. Graf Talk software, are reproduced by the HP plotter.

They mark the first time the office was able to use such graphic devices in its reports and, Lester said, "if you can translate data into a bar [graph] or a pie [chart], you can understand it."

Trust the name

Lester said the Sony-based system was chosen over that of several other vendors because "we were very impressed with their word processing, and we trust the Sony name."

He also said that the portable Typecorders, which use microcassettes to record both voice and text, made the package attractive because first drafts of reports could be written on the Typecorders and then loaded into the System 35 without the need for retyping.

His only regrets, he noted, are that the system is not IBM-compatible, a drawback that prevents the agency from swapping diskettes with national associations using IBM data processing products, and that it has an 8-bit processor. The system cost the city roughly $19,000, $9,000 for the word processing system alone, Lester said. The system came on-line six months ago.

TALK SENSE TO THE IBM PC.

Introducing PC/204, a link that lets PC users turn mainframe data into spreadsheets effortlessly.

PC/204, the newest productivity tool from Computer Corporation of America, is a powerful, efficient, easy-to-use software link between IBM personal computers and mainframes. It effectively answers the pressing problem of how to let corporate managers take full advantage of today's personal computers for making decisions, while also giving them access to the corporate database in a format they can use.

First, PC/204 guides PC users as they browse through the MODEL 204 database. Then it extracts the data they need and converts it into meaningful management information for spreadsheet analysis. Lotus 1-2-3 for example. And PC/204 does all that automatically. Without the PC user having to understand anything about mainframe technology.

If you aren't already using Lotus 1-2-3, we can supply it along with PC/204. Or you can use any current IBM PC business package.

While PC/204 is helping business managers, it's also helping MIS directors.

PC/204 uses the power and intelligence of the personal computer for increasing the overall efficiency of an application.

For one thing, it improves performance of the mainframe by offloading some of the processing to the PC, while reducing PC users' response time. It also makes communication between the PC and the mainframe more efficient.

What about security and control? PC/204 provides individual management views of the corporate database while still allowing PC users access to all the information they need.

PC/204 is the latest reason to get MODEL 204 DBMS which has been so highly rated for performance and programmer productivity.

For more information or to arrange for a demonstration of PC/204's capabilities, simply return the coupon or write to us on your letterhead.

'Whole Earth' covers software

SAUSALITO, Calif. — The publisher of the *Whole Earth Catalog*, the compendium of New Age items, has launched a new venture: the *Whole Earth Software Catalog*.

As a preview of the software catalog, publisher Stewart Brand has unveiled "The Whole Earth Software Review," which lists only those software products tested and approved by the publication's staff, according to Brand.

The review, which went on sale last month, also lists recommended books, hardware and dial-up services.

The premiere issue includes a roundup on using computers for writing, the result of a two-month teleconference.

Also in that first issue is an article titled "MeMicro: Why the IBM Personal Computer Is a Lousy Standard for the Industry."

"The Whole Earth Software Review" is slated to be published quarterly, as part of the research process for the *Whole Earth Software Catalog*, scheduled for release late this year.

"The Whole Earth Software Review" is priced at $15 (increasing to $18 in April) and is available from The Whole Earth Catalog and Review, 150 Gate Five Road, Sausalito, Calif. 94965.

NEWS

Data base listing out

DETROIT — Gale Research Co. has announced the publication of its "On-Line Data Base Search Services Directory," which provides detailed descriptions of the on-line information retrieval services offered by public, academic and private information firms in the U.S. and Canada.

Entries in the directory furnish up to 17 points of information about each organization, including items such as on-line systems available, subject areas, associated services, availability and charges.

Six indexes provide analyses of the information contained in the entries to assist users in locating the most appropriate search service for their needs, according to the vendor.

The directory is priced at $75 from Gale Research, located at Book Tower, Detroit, Mich. 48226.

Visicalc, Easywriter aids offered

NAPERVILLE, Ill. — Software that teaches microcomputer users to use Visicorp's Visicalc spreadsheet program and Information Unlimited Software, Inc.'s Easywriter II word processing program is available from Deltak, Inc.

"Managing Your Business with Visicalc or Visicalc Advanced Version Program" provides users with an understanding of return on equity, the use of return on sales to manage operations and asset and financial structures management, according to a Deltak spokeswoman. The package runs on IBM Personal Computers with at least 64K bytes of memory and Apple Computer, Inc. Apple II or Apple IIe microcomputers with at least 48K bytes of memory.

"Training for the Easywriter II" provides instruction on how to create, change, store and print documents using the word processing program. It consists of four diskettes and a printed guide.

The Visicalc tutorial is priced at $70 for the IBM version and $60 for the Apple version. The Easywriter II tutorial is priced at $70. Both are available through Deltak sales offices.

Deltak is located at the East-West Technological Center, 1751 W. Diehl Road, Naperville, Ill. 60566.

Multimedia courses unveiled on management, DP, personal skills

ARLINGTON HEIGHTS, Ill. — Advanced Systems, Inc. (ASI) has announced eight multimedia management, data processing and personal skills courses.

The courses include "Information Systems Project Management: Life Cycle Management"; "Information Systems Project Management: Project Control and Monitoring"; "Technology Perspective: Features and Differences of IMS/VS Release 1.3"; "MVS/SP: Sort/Merge Program"; "The Making of a Salesman"; "Dynamics of Sales Management"; "Supervisory Safety Series"; and "[VME] 2900 Concepts and Facilities."

The course times range from 1½ to 32 hours. Prices range from $1,500 to $12,600 per course.

Course tapes are also available on a rental basis.

ASI, 2340 S. Arlington Road, Arlington Heights, Ill. 60005.

Book details Northeast DP job sites

SCITUATE, Mass. — The Bradford Co. has published a directory containing 600 listings of New England companies that use computers or employ computer professionals.

The 1984 New England Directory for Computer Professionals includes information such as the company's major business, latest fiscal year sales, sales growth rate and locations. The listings also include the names of company officers, department managers and size of work force.

Information about the company's data processing department includes the type of hardware, software, computer languages, data bases and major applications that are used. The directory contains appendixes about employee benefits and user hardware.

The directory costs $26.50 and is available from The Bradford Co. through P.O. Box 256, Scituate, Mass. 02066.

ATTENTION COPICS USERS

A truly on-line, integrated Receiving, Quality and Material Control System replaces the COPICS Field Developed Receiving Module.

In addition to updating your MRP, Purchasing and Inventory Control data bases, this powerful system, RQMCS, features:

- Automatic Back Out
- Flexibility
- Only One Data Base
- Total Audit Trail
- Quality Control
- On-Line Updating
- Posting Options
- No Conversion

RQMCS users are enthusiastic about the system's processing speed and the immediate control it has provided for their entire receiving operation. For more information call:

CALENDAR

WEEK OF APRIL 8

APRIL 9-13, SAN FRANCISCO — **The New DP Revolution.** Contact: Technology Transfer Institute, 741 10th St., Santa Monica, Calif. 90402. Also being held April 23-27 in Chicago and April 30-May 4 in Boston.

APRIL 10-11, WASHINGTON, D.C. — **Personal Computers: A Hands-On Experience.** Contact: Datapro Research Corp., 1805 Underwood Blvd., Delran, N.J. 08075.

APRIL 10-13, WASHINGTON, D.C. — **CICS/VS Application Design.** Contact: Applied Technology Associates, Inc., Suite 200, 131 Park St. N.E., Vienna, Va. 22180.

APRIL 11-13, WASHINGTON, D.C. — **How to Build and Use a Data and Information Resource Directory.** Contact: Barnett Data Systems, 19 Orchard Way N., Rockville, Md. 20854.

APRIL 12-13, NEW YORK — **The IBM Personal Computer: Making It Work in the IBM Mainframe Environment.** Contact: Art Solomon, Techtran, P.O. Box 10212, 72 Cummings Point Road, Stamford, Conn. 06904.

APRIL 12-13, NEW YORK — **Micro/Personal Computer Operating Systems.** Contact: Digital Consulting Associates, 339 Salem St., Wakefield, Mass. 01880.

APRIL 12-14, CHARLOTTE, N.C. — **Carolina Computer Show.** Contact: L & J Associates, Inc., Suite 102, 115 Broadfoot Ave., P.O. Box 59729, Fayetteville, N.C. 28305.

APRIL 13-15, ALBUQUERQUE, N.M. — **International Personal Robotics Conference (IPRC).** Contact: IPRC, 1547 S. Owens St. 46, Lakewood, Colo. 80226.

WEEK OF APRIL 15

APRIL 16, NEW YORK — **Introduction to the IBM Personal Computer.** Contact: Center for Advanced Data Processing, Inc., Suite 402, 450 Seventh Ave., New York, N.Y. 10123.

APRIL 16, NEW YORK — **Word Processing with Multimate.** Contact: Center for Advanced Data Processing, Inc., Suite 402, 450 Seventh Ave., New York, N.Y. 10123.

APRIL 16-18, CHICAGO — **Introduction to Data Communications.** Contact: Systems Technology Forum, 9000 Fern Park Drive, Burke, Va. 22015.

APRIL 16-18, DENVER — **Data Communications: An Introduction to Concepts and Systems.** Contact: Datapro Research Corp., 1805 Underwood Blvd., Delran, N.J. 08075.

APRIL 16-18, BOSTON — **Data Communications: Effective Network Design.** Contact: Datapro Research Corp., 1805 Underwood Blvd., Delran, N.J. 08075.

APRIL 16-18, ROCHESTER, N.Y. — **Data Communications Systems.** Contact: Center for Advanced Professional Education, Suite 110, 1820 E. Garry St., Santa Ana, Calif. 92705.

APRIL 16-18, WAKEFIELD, MASS. — **Data Base Management.** Contact: Center for Advanced Professional Education, Suite 110, 1820 E. Garry St., Santa Ana, Calif. 92705.

APRIL 16-18, NEW YORK — **Advanced C Language Programming Workshop.** Contact: Structured Methods, Inc., 7 W. 18th St., New York, N.Y. 10011.

APRIL 16-18, ATLANTA — **VM/SP Structure, Flow and Tuning.** Contact: Goal Systems International, Inc., 5455 N. High St., Columbus, Ohio 43214.

APRIL 16-18, LOS ANGELES — **DP Disaster Recovery Seminar.** Contact: EDP Security, Inc., 181 West St., Waltham, Mass. 02154.

APRIL 16-18, LOS ANGELES — **Managing Application Software Support.** Contact: Infosci, Inc., Box 7117, Menlo Park, Calif. 94026.

APRIL 16-18, WASHINGTON, D.C. — **Personal Computers: Strategies for Managing.** Contact: Datapro Research Corp., 1805 Underwood Blvd., Delran, N.J. 08075.

APRIL 16-18, CHICAGO — **Videotex '84.** Contact: Sally Summers, London Online, Inc., Suite 1190, 2 Penn Plaza, New York, N.Y. 10121.

APRIL 16-18, SOUTHFIELD, MICH. — **Local-Area Networks.** Contact: Center for Advanced Professional Education, Suite 110, 1820 E. Garry St., Santa Ana, Calif. 92705.

APRIL 16-18, DENVER — **Data Communications for Microcomputers: Acquisition, Application and Implementation.** Contact: Datapro Research Corp., 1805 Underwood Blvd., Delran, N.J. 08075.

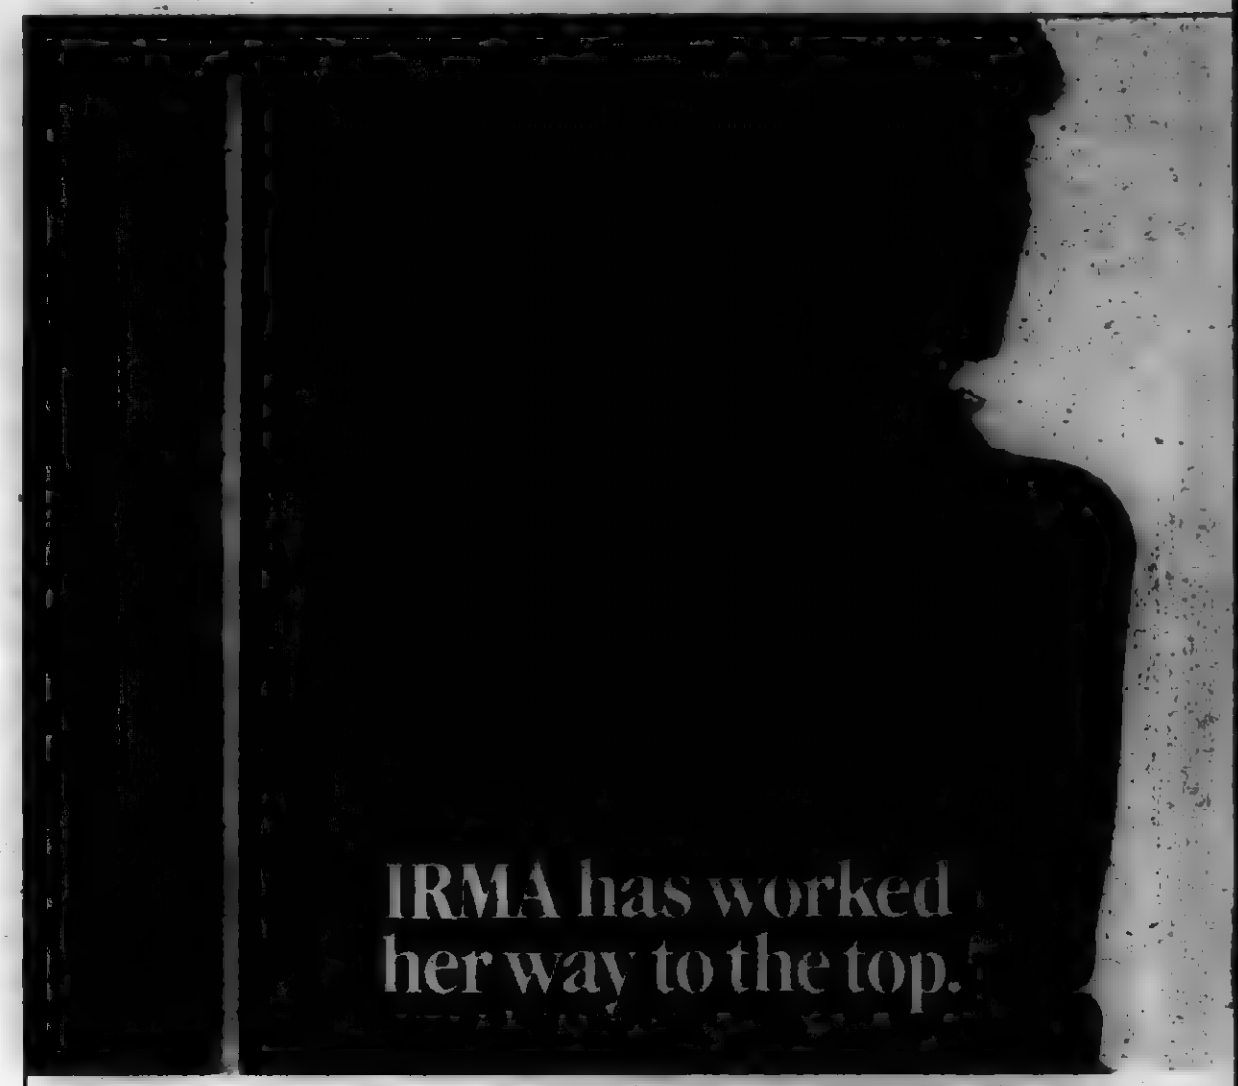
APRIL 16-18, SAN JOSE, CALIF. — **Network Communications Protocols.** Contact: Center for Advanced Professional Education, Suite 110, 1820 E. Garry St., Santa Ana, Calif. 92705.

APRIL 16-18, SAN FRANCISCO — **Office Automation Strategic Planning, Design and Implementation.** Contact: Datapro Research Corp., 1805 Underwood Blvd., Delran, N.J. 08075.

APRIL 16-18, SALT LAKE CITY — **Personal Computers and Networking.** Contact: Center for Advanced Professional Education, Suite 110, 1820 E. Garry St., Santa Ana, Calif. 92705.

APRIL 16-19, ATLANTA — **Technical Association of the Pulp and Paper Industry (Tappi) Computer-Aided Design Seminar.** Contact: Tappi, P.O. Box 105113, Technology Park/Atlanta, Atlanta, Ga. 30348.

APRIL 16-19, SADDLEBROOK, N.J. — **Structured Requirements Definition.** Contact: Georganna Carson, Ken Orr and Associates, Inc.,



She's Director of Decision Support, the leader in IBM 3270 mainframe/PC networks.

IRMA is taking charge! Her performance in over 25,000 IBM 3270 mainframe/PC installations has made her the industry's leading Decision Support Interface.™ Why? Because IRMA works. Easily and economically, IRMA's on the job giving PC users mainframe data access, selection, storage and communication back to the mainframe.

She's more capable than ever.

IRMA is a printed circuit board that slips into any available IBM PC/PC XT slot and attaches via coaxial cable to a 3270 controller. She's as easy to work with as the PC itself and provides standard text file transfer software

IBM PC and IBM PC XT are trademarks of International Business Machines Corporation. Apple Lisa is a trademark of Apple Computer, Inc. DEC Rainbow is a trademark of Digital Equipment Corporation.

Afips OAC '85 to take place in Atlanta

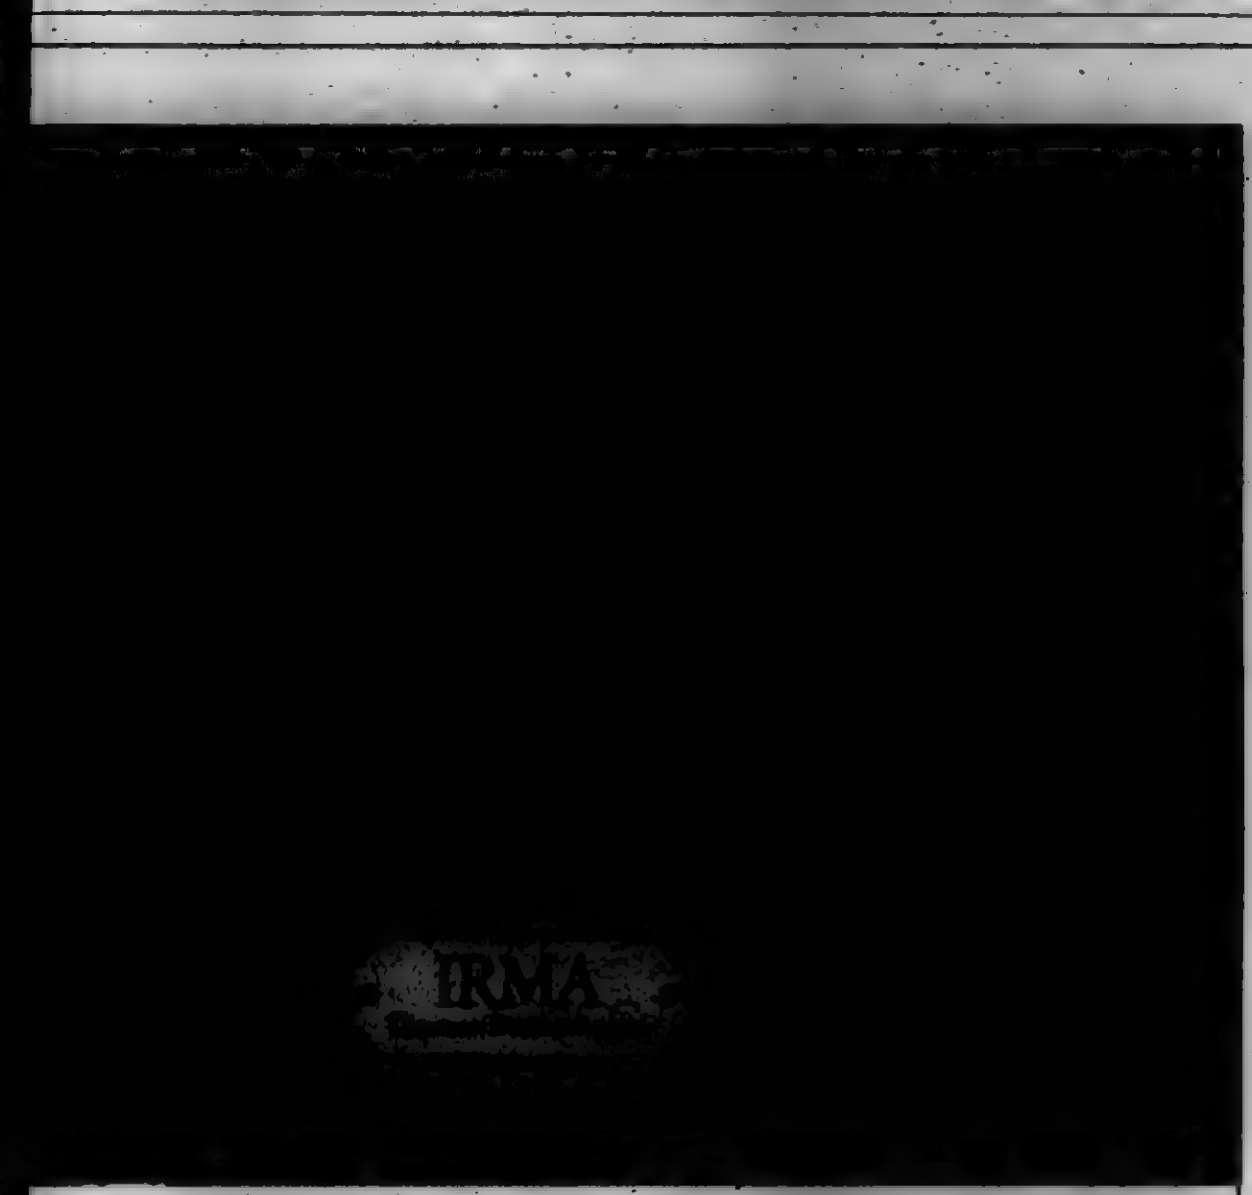
ATLANTA — "Today's Partnership: People & Technology" will be the theme for the 1985 Office Automation Conference (OAC '85), which will be held next Feb. 4-6 at the Georgia World Congress Center here.

The focus of the conference, sponsored by the American Federation of Information Processing Societies, Inc. (Afips), will be on the business value that can be achieved through the use of office automation technology. It will examine office solutions that can improve individual and organizational performance.

Emphasis will be placed on successful approaches for achieving integration and compatibility between systems, user needs and business strategies, Afips said.

The conference program will offer over 45 sessions in six tracks, including organizational impacts, "Office Workstations," "Ergonomics of the Work Place," "Communications Technologies & Issues," "Productivity & Requirements Evaluation" and "Networking Applications."

The registration fee for the full conference is $100 in advance. Further information is available from OAC '85, Afips, 1899 Preston White Drive, Reston, Va. 22091.



for VM/CMS and MVS/TSO mainframe environments, in addition to optional APL Terminal Emulation.

She's got more to offer.

Other IRMA products give you more ways to build cost-effective IBM 3270 and IBM PC-based decision support networks.

IRMALINE™ is the first coaxial link between 3270 networks and remote personal computers, including the IBM PC/PC XT, the Apple Lisa, the DEC Rainbow and others. IRMALETTE,™ the Asynchronous Interface, lets you run the same IRMA software in your remote personal computer that you run in the office.

So connect with success. With IRMA products from DCA. Call 1-800-241-IRMA.

EDITORIAL

The risk of 'look-alikes'

When a vendor hits upon a successful product, a group of look-alike products traditionally follows. In the case of the class of machines into which Digital Equipment Corp.'s VAX-11 and IBM's 4300 falls — superminicomputers through low-end mainframes — that group has grown into a swarm.

At last count, better than 95 processors fit into the same general arena as the VAX-11 and 4300 [CW, Jan. 30]. Some are plug-compatible, or "me too," products. Others offer very similar performance characteristics. Still others offer similar performance, but with a twist, such as fault tolerance or a specialized local network.

One of the latest entrants in the supermini market is Gould, Inc., which has announced the Powernode 6000 [CW, March 19]. Introduced in a big "VAX attack" campaign, the Powernode 6000 is Gould's first virtual memory processor.

While fierce competition has been a keystone of the American way of doing business, the overload of machines in the 4300/VAX-11 marketplace is getting silly. And the situation will probably get worse; lurking on the edge of this overcrowded marketplace are hordes of up-and-coming vendors of supermicrocomputers that have set their sights on a segment of the mid-range market.

Are there really enough users out there to support the throngs of vendors claiming to have the perfect mid-range processor? Probably not. And the result could be a huge vendor shakeout from this market segment.

Some manufacturers of 4300-compatible products have already felt the sting of the overcrowded marketplace. IBM has 11 systems aimed at the mid-range processing market. As a result, firms like Magnuson Computer Systems, Inc. have fallen victim to sagging sales. Now IPL Systems, Inc. appears to be having problems coping in the IBM 4300 marketplace.

Computer companies know the risks when they embark on a new product line. But what about the users? Who will service a mid-range computer system from a defunct vendor? These are not $5,000 throwaway microcomputers; most cost better than $100,000, some closer to $500,000.

And what about enhancements to a system that is no longer marketed? Users may find themselves buying up parts on the used market or forced to convert to another vendor's system.

If and when the mid-range shakeout finally arrives, the vendors who find themselves facing Chapter 11 will have no one to blame but themselves. Countless uncharted marketplaces are just waiting for a clever entrepreneur or a progressive, established company to crack open with an innovative product.

Five years ago, then-struggling microcomputer companies like Apple Computer, Inc. had a hard time getting anyone to listen to details about their new class of processor. Now a speech by Apple Chairman Steve Jobs can pack an auditorium.

Who will pack the auditoriums 10 years from now? Certainly not the vendors of look-alike products. Chances are, many of those in the 4300/VAX-11 market will have been long forgotten. It will be executives of companies that decided to offer products different from those available from DEC, IBM and other major vendors who will draw the crowds.

LETTER

One-minute DP management no panacea, can cause loss of confidence

One-minute management, as described in J. Daniel Couger's In Depth article "The one-minute DP manager" [CW, Feb. 27], is no panacea.

A project leader once took a minute to tell me that if I knew anything about structured programming, I should know that each IF is successively indented, that ELSE goes on a separate line and so on.

Rather than show off that structured programming meant reducing flow of control to three basic types to enable proof of program correctness, I showed him that a lengthy case statement — IF . . . ELSE IF . . . ELSE IF — would cause difficulty on his terms.

He said I could get around that, and he showed off his power by leaving then.

He was not describing structured programming, but a particular implementation of it: a standard. I was not allowed to defend myself or to show how the current standards manual specifically supported me.

The project leader's standards were issued six months later.

In only one minute, by directly and unjustifiably challenging my competence, my project leader completely destroyed his manager's 10 minutes of representing to me that potentials were wide open in that shop.

I never again felt confident about working there.

Computerworld is a member of the CW Communications, Inc. group, the world's largest publisher of computer-related information. The group publishes 92 computer publications in 19 major countries. Nine million people read one or more of the group's publications each month. Members of the group include: Argentina's Computerworld Argentina; Australia's Australian Computerworld, Australian Micro Computerworld, Australian PC World and Directions; Brazil's DataNews and Microideia; China's China Computerworld; Denmark's Computerworld Danmark and Mikroverden; Finland's Mikro; France's Le Monde Informatique, Golden (Apple) and OPC (IBM); Germany's Computerwoche, Mikrocomputerwelt, PC Welt, Software Markt, CW Extra/Sonderausgabe, Computer Business and Communications Magazine; Italy's Computerworld Italia; Japan's Computerworld Japan and Focus Committee; Mexico's Computerworld Mexico and Computerlandia; Netherland's Computerworld Benelux and Microfacts; Norway's Computerworld Norge and MikroData; Saudi Arabia's Saudi Computerworld; Singapore's The Asian Computerworld; Spain's Computerworld Espana and Micro Sistemas; Sweden's ComputerSweden, Mikro Datorn and Alla Hemdator; the U.K.'s Computer Management and Computer Business Europe; the U.S.' Computerworld, Hot CitiOs, In-Office, Infoworld, J., Macintosh, MICRO MARKETWORLD, Microcomputing, PC World, PC Jr. World, Run, 73 Magazine and Software.

VIEWPOINT

Distributing centralized data entry function

THE DATA CENTER
John P. Murray

If you are a data center manager that is still operating a centralized data entry function, there is a very effective method you should consider to reduce your data center operational costs, while at the same time improving the level of satisfaction of your data center clients. The method is to install software that will allow you to distribute the centralized data entry function. In addition to the acquisition of appropriate software, the process is to develop a plan that will assure the success of the venture and then to act on that plan.

The first step is the selection of a software package that will allow data center clients to enter their own data. The criteria for such a package are rather simple: It must be easily installed and maintained, the input screens should be easy to build and to change, and the vendor should have a proven record of a continuing high level of support to those who purchase the software.

Price has not been listed as an item of importance. The reason is that, at least in my experience, not only is the expense associated with the purchase of such software reasonable, but the potential pay back, even in a small data entry section, is so good that the purchase price of the package should not be a serious factor. In the situation with which I am familiar, a 10-member data entry section was distributed for a net annual savings (hardware and personnel) of $130,000. The software investment was a one-time investment of $15,000.

Reliable products can be found

It is increasingly becoming the case with much of what we do in MIS that the issues involved in the distribution of the centralized data entry function center more on the political, emotional and the managerial than on the technical. The reason for this is that the technology in most areas has evolved to the point at which, if care is exercised, very good, very reliable products in all areas of the technology can be found, and they are getting better all the time.

Given that circumstance, consideration of the process used to move the data entry function in a successful fashion from the data center to the client areas may prove helpful to data center managers who would like to carry out such an effort in their organizations.

A little background first: When we began to dismantle our data entry section, all client areas had CRTs, and the clients were comfortable with operating the units. We also had a standard, rigidly enforced data entry schedule for the keying forms to be submitted to the data entry section. If the input did not arrive on schedule, it would not be processed for the next cycle. From the MIS point of view, this was a necessary constraint; from the point of view of the clients, it was not always beneficial.

We began our project to disburse the centralized data entry function in the way we have found to be effective in many of our efforts to change and enhance our MIS environment. The first step, after we had obtained permission from senior management to move ahead, was to install and test the software thoroughly. The software was rented on a 90-day basis in order to assure its quality prior to purchase. Once the software was tested, we selected a client who had an interest in the process and began by moving several of his smaller jobs under the new system.

We used a sales/marketing approach in that we started small, worked very carefully and made certain we were successful in order to build credibility. The idea here was to build our case through the development of a successful track record. A requirement was to be able to demonstrate the productivity of that which we were proposing.

Not met with unanimous joy

The announcement of the proposal to distribute the data entry function and responsibility to the client areas was not met with unanimous joy. There was understandable concern on the part of the clients who had the largest volume of data entry work that they would not be able to handle what they viewed as an increased work load. However, an examination of the function, which had been done by the data entry section prior to the announcement of the project, showed that the result of the change would not mean any increased work, only a change in function.

The crux of the argument was that, because the clients had been entering all information onto forms that then had to be delivered to the data center for keying, the direct entry of the input via the clients' currently installed CRTs would not take any longer and in many instances would be faster.

Another positive aspect of this change was that clients would gain an additional three or more hours of time every day for entry of their data. This was because the keying, which would be done in the client areas, could continue almost to the time of the processing of the various batch jobs that required that input. Under the centralized function, time had to be provided each day to receive the input forms from the client areas and then key and verify the input data.

The project, which required eight months of time, was completed on schedule. A plan was developed to move the project ahead on a phased basis. The process was to identify a particular department, correct all the work in that department and provide the required training for the client department personnel before moving to the next area. The department with the largest volume of data was the last one to be converted. The plan was to begin with the small departments, not only to make more rapid apparent progress, but also to be able to identify areas of concern on a small scale and to learn as we went along. We viewed this as an appropriate way to minimize risk. The data entry section assumed responsibility for the project.

The plan to disband the data entry section was announced to the data entry personnel well in advance of its implementation. It was made clear that the process would be carried out on a phased basis and that as the work level in the data entry section was reduced, we would work with the organization's Employee Relations Department to find those who were interested in jobs within other sections of the organization. Through careful planning, all but one of the data entry employees were offered (and accepted) jobs in other departments of the company.

Aside from the positive aspects of the reduction of the data center work load and expense and the improvement of scheduling considerations for the clients, one more unexpected, yet pleasant, benefit came about for the data center as a result of the success of the project: Complaints about the quality of the data entry work have disappeared. In all respects, the project has been a success. I certainly recommend it to anyone who still has a centralized data entry function in operation. ‡

Look around at changing world instead of accepting compromises

Congratulations to Nissan Motor Manufacturing Corp. U.S.A., and congratulations to *Computerworld* for its editorial "Logic resting in the illogic" [CW, Feb. 20] on Nissan's bold decision to combine its information systems operation with its purchasing department.

Imagine! Information systems no longer reporting to or being "buried" in the finance or production departments. Instead, it reports to a function whose sole qualification apparently is that it is unbiased and "will not mold them to favor the parent department." Logical? Progressive? I think not. In fact, it sounds like a selection between the lesser of two evils.

Why not try a really radical approach: a function that operates as a full partner in the corporate plan and is recognized as the key strategic resource that it is quickly becoming. To do otherwise is to perpetuate an organizational convenience that has itself been a prime contributor to the information management problems that corporations like Nissan are trying to escape.

And while we're at it, why not select an information management cum business professional as the department director.

What? You say that data processing people capable of managing a business function don't exist? Look again. Leading corporations that have come to recognize the importance that information systems have on their future are making these decisions every day.

I suggest that Nissan and *Computerworld* take another look at the rapidly changing world around them and stop being so content with compromises.

F. Richard Lennon
Vice-President, Administration
United Technologies Sikorsky Aircraft
Stratford, Conn.

Info function: little new in concept of Nissan's 'two-in-one' department

In the article "He heads 'two-in-one' department" [CW, Feb. 13], Robert A. Prinier, vice-president of purchasing and information systems since Jan. 1, describes Nissan Motor Manufacturing Corp. U.S.A.'s "two-in-one" department as a "concept [that] might knock the computer industry on its ear."

I find little new in the concept. For years, organizations have been trying to control the information function through other divisions headed by non-DP vice-presidents. Only the maturely managed corporations recognize the need to place the responsibility of information systems under an independent vice-president who is recognized as a professional information systems person.

Patrick J. Shirley
Lacey, Wash.

Overlooking the obvious: info systems, services tie together other departments

It is interesting to note that both Nissan Motor Manufacturing Corp. U.S.A. in the article "He heads 'two-in-one' department" [CW, Feb. 13] and *Computerworld*'s editorial "Logic resting in the illogic" [CW, Feb. 20] have overlooked the obvious.

Well-designed and functioning information systems and services tie together all the other production and supporting departments within, as well as the customer and vendor interfaces to, an organization.

An integrated information systems and services department is most effective when headed by an

VIEWPOINT

LETTERS from page 57

executive-level vice-president reporting directly to the president.

However, with today's inexpensive hardware, a case can be made for the following distributed information systems and services organizational structure:

- The development of new subsystems resides in the engineering department using its own developmental computer.
- The operation of the existing production system resides in the production (manufacturing) department using its own production computer.
- Newly developed subsystems supposedly ready for production operation are first independently tested by the quality assurance department, using its own quality assurance computer identically configured to the production computer.
- The following personnel are trained, prior to turnover of the new subsystem to production status, by the training department on its own training computer, which is identically configured to the production computer: production personnel who ultimately must operate the new subsystem in the production environment; maintenance personnel who ultimately must maintain the new subsystem in the production environment; and user personnel who will use the new subsystem through terminals, phones and so on.

Each of these departments — engineering, production, quality assurance and training — having a portion of the information systems and services function as a subunit under it, reports to the president in the traditional organization structure.

Which information systems and services structure, integrated or distributed, is most cost-effective depends on many factors. But either is inherently superior to the situation in which an entire information systems and services department is subordinate to one of the other organizational units.

A sound case cannot be made for each department independently developing and operating separate systems. Live business information needs to be consistent in meaning and content at any given point in time throughout the organization. This cannot be effectively achieved without the use of an organizationwide data base, standards and data dictionary. Furthermore, much business information must be readily and simultaneously accessible by executive management and other departments in the organization.

Information standards and the data dictionary are maintained by the engineering department in the distributed structure or by the information systems and services department under the integrated structure.

All other things being equal, the integrated information systems and services structure provides the most efficient opportunity to undertake effective disaster recovery facilitation and data security measures. Information systems inherently ties together the entire organization. It doesn't make sense either to split it or subordinate it.

Major reason for 'snake-oil' image of DP salesman: too much snake oil has been sold in form of computers

In response to Joseph P. Zammit's reader's-platform article "Are computer vendors getting a fair shake? How to avoid the 'snake-oil' salesman image" [CW, Feb. 13], the major reason for the "snake-oil" image of computer salesmen is simply that too much snake oil has been sold in the form of computers.

There are many small businesses around that have nonfictional horror stories to tell, and most of the businesses never sued. No plaintiff's computer lawyer is going to succeed in telling a farfetched computer fraud story to a judge or jury when Zammit or any other skilled attorney is representing the vendor.

It is quite common for a user to believe the salesman's claim, "This new model, the B3X, will meet all your computer needs." That salesman is usually billed as a "sales engineer" and is usually good at appearing to know what he is talking about. But too frequently, the salesman doesn't have the foggiest idea of that user's needs or the capabilities of the computer in question. Certainly, the user can be blamed for believing the salesman instead of clearly defining his needs and getting them written into the contract. Con men have flourished for centuries because most people don't insist on everything written in blood.

I've always admired the lawyer who is able to put forth, with a straight face, the following defense: "Your Honor, the plaintiff should not recover in this case if he was stupid enough to believe my client's sales talk."

It is interesting to note that some juries have rendered rather large verdicts in the past couple of years for users who have been victimized by fraud.

Because of those verdicts, some vendors have cleaned up their acts. One used to be proud of the general perception that it was the "bastard" of the industry. Now it has matured and provides even some nonexpert users with support.

Other vendors did not have much of an image problem to begin with, because they stood behind the products they sold, instead of hiding behind the small print in their standard form contracts. Tightening up their standard form contracts will help responsible vendors, but not the others.

Admittedly, the first-time computer user market is a difficult one for vendors. Those users are typically naive, unskilled and generally unwilling to appreciate the dedication of their own resources necessary to get a functioning computer system. Of course, the salesman is not going to make the sale if he emphasizes the difficulty of getting the B3X to work. But that doesn't mean that the salesman can prey on the user's naivete. It is at least deceptive, and probably fraudulent, to state that the B3X is the right computer if that's only a guess, even an educated one.

Vendors who encourage their salesmen to have the attitude "Tell them anything in order to make a sale" are going to continue to have an image problem.

Edward G. Sallaberg
Woburn, Mass.

finish the job. This approach hurts both our development and our maintenance productivity in two ways.

First, our developers and maintainers must learn and retain their skills in multiple languages — they must know both the syntax of the generator and the syntax of the shop's traditional language. This requirement means a steeper learning curve for new personnel and generally higher level skills for all personnel.

Second, the two-language approach creates confusion when testing or production problems arise. There is no single place to go to review the overall control flow of the application since the flow implied in the generator syntax may be contradicted or altered by the exit code.

Multiple debugging tools

Isolation of a problem in this environment may require multiple debugging tools — one for the generator syntax and one for the traditional code. The need for more tools increases the requisite troubleshooting skills of the programmer and reduces the potential performance of the product.

An example of good continuity is Information Build-

First, our developers and maintainers must learn and retain their skills in multiple languages — they must know both the syntax of the generator and the syntax of the shop's traditional language.

ers, Inc.'s Focus. This high-level information management system provides facilities for report preparation, data base management, interactive query and update. The following syntax example illustrates how the product provides essentially one syntax supporting a broad range of functions:

```
   SUM QUANTITY AND COMPUTE
NEWPRICE
      IF CLASS EQ 'A' THEN
         PRICE * 1.10
      ELSE
         PRICE
   BY ITEM
```

This statement will pass an inventory file and produce a report showing the total on-hand quantity of each item across all stocking locations. It will also compute and report a 10% price increase for all Class A items.

Passing a file, handling the break processing and summarization are large, high-level functions. Yet in the same statement and with the same style of syntax, we have an if-test on a single field of each record passed. It is this type of continuity that we desire.

Extensibility. Extensibility features of an application generator allow the developer to implement new syntax, which allows productivity improvements that are unique to a given shop.

We accept that the basic syntax provided by you cannot be customized to the needs of diverse industries such as banking, manufacturing and distribution or functional areas such as general ledger, order entry, material requirements planning and decision support. Certainly the product cannot consider the unique architecture and demands of each application or enterprise. Extensibility features allow industries, functional areas and enterprises to extend and broaden the power of

Announcing the birth of the *Personal* Information Center™ — a new concept in intelligent data access for your company's end users.

And you're invited to a FREE, half-day Seminar to learn all about this innovative *first* from Informatics.

At this free Seminar you'll see how the *Personal* Information Center can help you:

- Manage and control the continuing proliferation of hardware and software in your Information Center.
- Integrate your Information Center with today's mainstream DP and IBM® Personal Computer tools.

But that's only the beginning. At the Seminar there will be a lively discussion of such vital Information Center issues as...

- Selecting appropriate hardware and software for your users' needs.
- Offering immediate versus deferred processing.
- Using production data bases or duplicating files.
- Balancing unlimited data access with system security concerns.

The Seminar will also address the entire issue of the micro-mainframe connection, and many more topics of immediate interest to data professionals like you.

Plus, we will introduce Informatics up-to-the-minute solutions to your Information Center needs, including reporting and inquiry systems and micro-mainframe integration tools.

The *free* Personal Information Center Seminar is being offered in or near your city. But attendance is limited. So, mail the coupon or call toll free today to reserve your place at this valuable *free* Seminar.

Pre-register for the *free* Personal Information Center Seminar and get a free bonus. We'll send you a reprint of the *Computerworld* article, "The Micro/Mainframe Link," by Merrill Lutz.

the generator. We desire more than a CALL, PERFORM or DO function as a means of extending products. Subroutines can provide common functions for our developers, but they do so at the expense of clarity. The usual interface to subroutines involves defining and formatting data areas that provide communication between the main routine and the subroutine. When maintaining or debugging the code, we must often trace back through the program to determine the exact contents at the time of the error.

Furthermore, it is often more work to invoke the subroutine than to recode the function in-line. This means the common function must be fairly large before it is economical to provide it to developers.

We would, therefore, prefer to extend the functions of our development environment by defining new syntax. New syntax can document the function being performed more clearly than subroutine call interfaces that have to be examined closely to reveal the same information. For example:

```
CONVERT DATE FROM JELIAN (WS-JELIAN)
    TO CALENDAR (WS-CALENDAR).
```

is far more descriptive than

```
CALL "DATACONV" USING
WS-CMD
WS-FROM
WS-TO.
```

Another advantage that syntax has over subroutines is that it can be partially validated at the time it is entered or prepared for execution. A call interface can only be checked by the subroutine during the execution of a test.

Finally, syntax extensions support our first requirement of continuity. Training programs for developers should include both the basic and extended syntax as opposed to basic syntax and a potentially diverse set of subroutine interfaces.

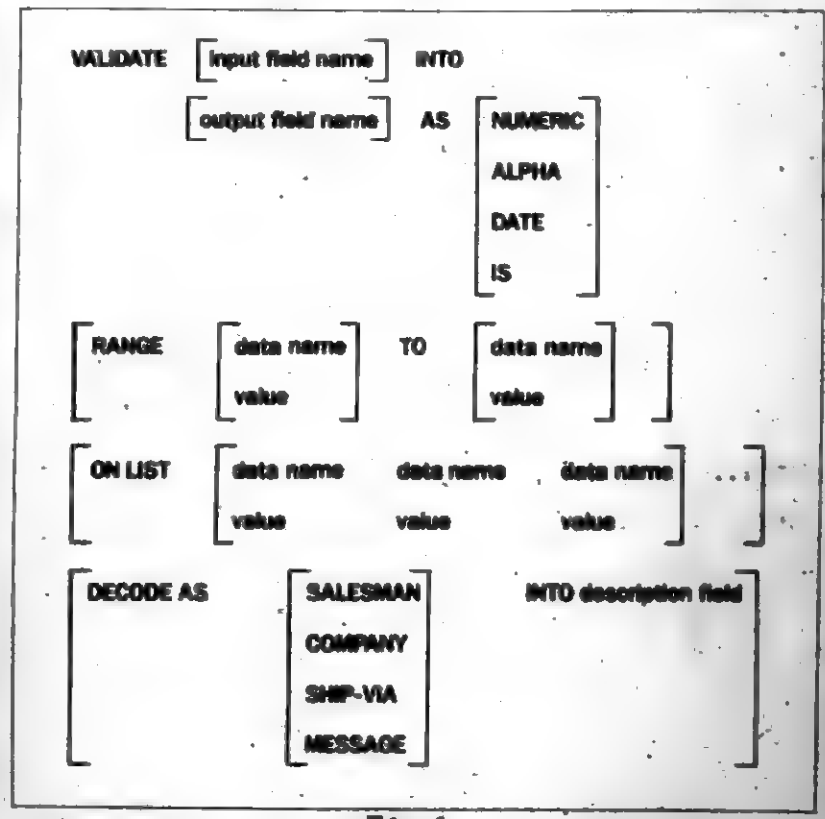

Figure 1

Pansophic Systems, Inc.'s Gener/ol is one product that provides extensibility features by allowing developers to augment the existing syntax. Gener/ol is an interactive on-line program development system that allows developers to add commands to its vocabulary, specify syntax rules for the new commands and pass data through the syntax to a user-written command processor. A potential use of this feature is to provide access to data base management systems other than those already supported by the vendor of the product.

A second example of an extensible product is Applied Data Research, Inc.'s Meta-Cobol. Meta-Cobol provides, among other things, a macro preprocessor for the Cobol language. This preprocessor allows a development group to extend the Cobol language with powerful statements that still maintain the style and data definitions of the original syntax. Figure 1 is an example of the use of this product.

This example shows two types of Cobol language extension. First, there is an application-independent function — validating the format of input fields and editing the data into a known, fixed format. Second, the implementation of the DECODE syntax references tables that are specific to a given shop such as the SALESMAN and COMPANY tables. This same syntax has been used to generate Cobol validation code for batch programs and for on-line programs that interface with IBM's CICS/VS.

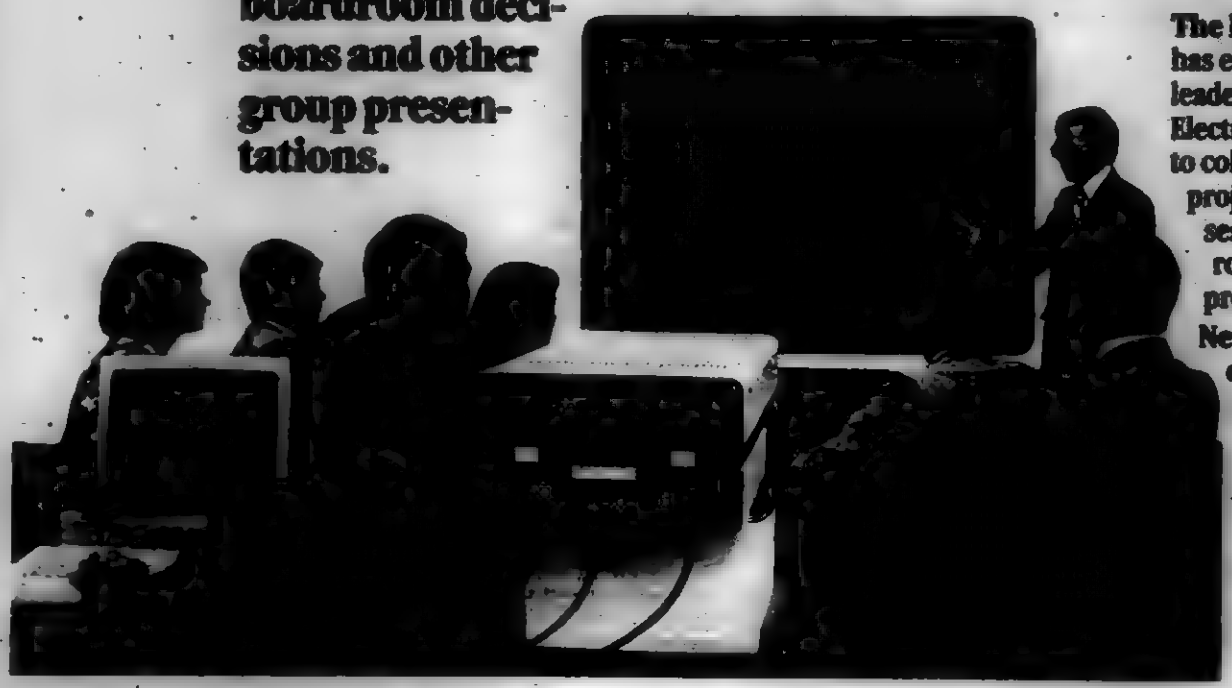
Performance. The performance of the application generators should be sufficient to allow implementation of all but a few of the application functions. Remember the 1977 Kendall Report?

Figure 2 implies that even an inefficient generator can be used to generate 50% of our programs since they

NOW ELECTROHOME HAS SIMPLIFIED

Electrohome EDP 57 has achieved worldwide success in monochrome computer projection for training sessions, sales meetings, boardroom decisions and other group presentations.

Now Electrohome ECP 1000 makes it just as easy to project color computer graphics and data or videotapes to big screen size.



The EDP 57 monochrome system has established Electrohome as a leader in computer projection. Now Electrohome is ready for your move to color computers—and your need to project color videotapes in training sessions, sales meetings, boardroom decisions and other group presentations.

New ECP 1000 is so sophisticated, it's simple. You can't imagine how easy it is to set up and operate. Colors are automatically converged in the unit and projected through a single lens—thanks to the Electrohome breakthrough in Laser Aligned Dichroics (LAD).

only consume 5% of the CPU. The diagram also suggests that we take great care with the 2% of the programs that consume 50% of the CPU, since relatively minor inefficiencies in implementation could dramatically increase the cost of running these applications.

The key to productivity is the remaining 48% of the programs that consume 48% of the CPU. If the generator can support these programs with adequate performance, then application generation can be the development approach used for at least 98% of the shop's applications. We can concentrate developer training on the proper use of the generator and retain a few people familiar with traditional languages to support the last 2% of the shop's jobs.

If the generator devours too many hardware resources to be considered for the middle 48% of our programs, then we must either support a split staff and two training curricula, or we must make everyone competent in both traditional and generator-based development techniques. The former approach is expensive and limits the flexibility with which we can assign people to projects. The latter approach tends to provide personnel who are adequate, but not expert, in both approaches.

Responsiveness. A responsive product allows the developer to define processing requirements interactively and then begin testing without a significant delay or disruption in the work flow.

Some generators require a lengthy preparation time after logic entry and to translate, compile and link the logic into executable code. Under these conditions, developers usually fill their time by working on several programs concurrently. However, when moving back and forth from one program to another, the developer's concentration is broken. The time and effort spent in regaining focus on a particular set of logic and test conditions lowers productivity and may lessen the quality of the final product.

Figure 2

We users have found substantial morale differences between developers working in environments that provide immediate reinforcement and those that do not. This points to a more subtle way in which delays can hurt productivity. Behavioral psychologists say we learn most quickly when we receive immediate positive reinforcement for correct behavior and immediate negative reinforcement for incorrect behavior. A delay between coding and testing robs us of the immediacy and satisfaction of the reinforcement that testing should provide.

A number of application generator products are very interactive and do not require an off-line preparation procedure. Oxford Software Corp.'s UFO briefly prepares code for immediate execution without having to submit the code to another environment for preprocessing. IBM's Cross System Product/Application Development allows interpretative execution of application logic during testing. The interactive nature of these products has enabled us to make significant strides toward meeting our goal of responsiveness.

Power. A powerful application generator will allow us to manipulate sets of data instead of individual elements or aggregates. Also, it will allow us to perform many or complex operations with a few simple commands.

Power allows our design, coding and testing efforts to rise above the

COLOR COMPUTER PROJECTION.

By comparison, other systems have three lenses and dozens of controls that must be adjusted by trial and error to converge colors on the screen. You have easy one-button switching from high resolution data and graphics to brilliant video with lock-in picture size. Ideal for portable or permanent use and for front or rear screen projection. And you can benefit from the last word in color video projection even before you move up to color computers.

IN DEPTH/LETTER TO VENDORS

Figure 3

level of detail required in traditional approaches. In some cases, power has actually decreased when we moved from our traditional languages to the application generator. For instance, some generators have particularly weak table and array handling, a feature we take for granted with traditional languages such as Cobol or Fortran.

Another common weakness is the failure to provide field edit and reformatting facilities that will automatically perform validation and data reformatting functions when entered by the end user from a terminal.

An example from Focus emphasizes power:

```
SUM QUANTITY AND ROW-TOTAL AND COLUMN-TOTAL
  BY PRODUCT ACROSS LOCATION
```

This statement might produce a report that looks like Figure 3.

This statement navigates the data base looking for all inventory segments and then totals the QUANTITY amount across all stocking locations and reports the totals by product and by location with both columnar and row totals. This is all performed without our having to code loops, low-level data base navigational commands, control break or page break logic. Hence, the importance of power in an application generator becomes quite apparent.

Compatibility. Compatibility features allow applications created by the generator and applications created by traditional approaches to present a single system image to the terminal user. Without this feature, the users of our systems may have to follow a procedure such as the one shown below:

- Sign on to the execution component of the application generator.
- Request the desired function.
- Sign off the execution component of the application generator.
- Request a traditional application function.
- Sign back on to the application generator.

In many instances, vendors have designed a separate environment within the on-line monitor. Within this sheltered world, application generator functions are implemented. What has been neglected is a programmatic means of entering and exiting this environment in order to execute functions that reside in traditional applications.

Some of us have not been too affected by this problem. Either our users have had work assignments that did not encompass both traditional and generated applications or we have based our entire application inventory on the generator. Most of us, however, must continue to live with both old and new applications until the older ones can be retired through attrition.

To date, the best examples of compatibility have been found in approaches that create or assist in the creation of traditional language programs. IBM's Elias provides Cobol or PL/I shell programs into which "bricks" of code are placed as the developer specifies the processing needed. Application or shop-specific logic is then added to the shell to complete the program. Since the resulting program is in the traditional language, it can provide a programmatic interface with existing applications.

Testing support. Interactive debugging facilities should be integrated with the development and execution components of the application generator. These facilities should include the following features:

- The ability to place breakpoints at any statement.
- The ability for breakpoints to be conditioned on data values.
- Symbolic display of records and working areas from any breakpoint.
- The ability to correct errant logic at any breakpoint and to continue processing.
- The ability to trace the application logic flow interactively.
- If the execution components or user extensions to these components are written in the language of the generator itself, the debugging facility should not lead the developer into this code. The developer should need to debug only the logic that he has coded.

Maintainability. The structure of the generator syntax should encourage the creation of maintainable code.

Good structure can be encouraged by prompting the developer to specify his logic in levels of progressively more detailed program definition oriented to the inputs and outputs of the major data structures.

Separation of control logic from processing logic can be encouraged by controlling the use of statements that effect major changes in the flow of logic. These statements should be confined to specific areas of the program that reside at a high level in the logic hierarchy.

At each level the developer can be prompted for a description of the major business functions being performed at that level. The syntax should be self-documenting as to how the function is implemented; the comments are required to describe what the business problem is.

An example of a highly structured generation dialogue is found in IBM's Cross System Product/Application Generation. This product guides the developer through definition of the processing logic in a top-down, step-by-step fashion. A developer using this product is prompted to describe an application in terms of a group of processes.

By forbidding the developer to jump from process to process in code other than the flow section, a discipline is imposed on the resulting program that tends to enhance the system's reliability. It cannot thwart a pathological programmer, but it can at least encourage sound programming practices.

Processes consist of statements and statement groups supporting input or output of data from a file or terminal. Each process has three separate sets of statements associated with it.

First, the Before statements prepare for the I/O by formatting the data to be displayed or the key of the record to be read. Second, the After statements manipulate the data input or examine the return code of the I/O function. Third, the Flow statements alter the default flow of one process to another based on function keys, entered data or other conditions.

By forbidding the developer to jump from process to process in code other than the flow section, a discipline is imposed on the resulting program that tends to enhance the maintainability and reliability of the system. It cannot thwart a pathological programmer, but it can at least encourage sound programming practices.

Postscript to developers

We have cited a number of areas where you could improve your products to deliver more productivity benefits to us. But what do we do while we wait for the requested changes?

There are a number of strategies that offer an interim solution and, although the choice of strategy depends on the needs of each specific shop, some general recommendations can be offered:

1. Decide whether or not to use a generator for a particular application during the technical design of

In 6 hours you can protect your investment in software and enhance its capabilities

Time is tight. The software revolution is already here, and it's moving at full throttle. To keep you apprised of where it's going and how to get there before your competition does, Martin Marietta Data Systems is presenting "New Dimensions in Software: A Strategy for Managing Information". This informative seminar series will examine the trends, issues and emerging solutions that will greatly affect the way you conduct operations in the very near future.

Corporate data management, the micro-to-mainframe connection, PC proliferation in the corporate office, the application development backlog, CPU utilization . . . each of these topics share one common characteristic: the need for a unified software solution.

Not as Simple as 1 . . . 2 . . . 3 . . .

Today's corporate information needs can no longer be met piecemeal, with a software package here, a productivity tool there and everywhere a logjam of vital but inaccessible data. A comprehensive software strategy is the new order. Based on corporate-wide perspectives and the harmonious interaction of all information systems.

Integration and the Martin Marietta Difference

Martin Marietta's commitment to software technology speaks for itself: From our MAS family of high-performance application software packages . . . to RAMIS® II, the world's leading fourth-generation language and foundation for the most advanced line of productivity and systems software available anywhere . . . to the ITSoftware series of personal computer programs for transforming your desktop computer into a total information center. Plus an expertise in custom-built systems based on real-world experience.

We invite you to explore our New Dimensions in Software during this seminar series. Two distinct sessions will be held: Seminar A for corporate executives and vice presidents of manufacturing, MIS, and finance, and Seminar B for data processing executives and management. Attendance is free. And the potential benefits could have substantial impact on capital investments and productivity.

To register or receive more detailed information on the seminar series, call toll-free (800) 638-7080. In Maryland: (800) 492-7170. Or write:

the system rather than when you begin to implement. This will allow the designers to weigh the continuity characteristics of the tool, its performance, its power and its compatibility with existing systems against the complexity of the application and the needs of the users.

For instance, some tools can perform simple tasks very easily, particularly if the designer uses the strengths of the product instead of battling its weaknesses. Also, many applications may have a relatively short expected life span and, therefore, are insensitive to the fine points of maintainability.

2. Provide proper training in the use of the application generator for both the programmers and the designers. If the designers are to evaluate correctly the product for use in a specific application, they must understand its strengths and weaknesses. If programmers are to attain the advertised benefits, they must understand how to use properly the tool. The generator should be treated with the same respect as we have given traditional languages in terms of training and technical support.

3. Analyse where the time is really being spent in your shop. Perhaps you concentrate on maintenance and do very little development, or perhaps your systems strategy has emphasized the installation and tailoring of application packages over custom development. In these cases, an application generator can do little more than support the creation and maintenance of test data.

They may still provide significant value, but their requirements of the package are a bit different in this environment than in the custom-development environment.

4. Get control over your traditional language development. Until the generators improve or unless they are suitable for your shop as they stand, important systems will continue to be built using traditional languages. However, there are many opportunities for productivity improvement in these situations.

The generator should be treated with the same respect as we have given traditional languages in terms of training and technical support.

To seize these opportunities, you need:

- Management commitment to treat systems development as a normal business activity.
- An established methodology for systems development that can provide a framework within which productivity and quality can be managed.
- A well-defined technical architecture that will result in the use of a small set of well-tested techniques.
- A training program that teaches the prescribed set of design and implementation approaches.
- Software that insists or encourages that the standards and approaches, described in the technical architecture and which are explained in the training, are consistently applied to the development process.

About the author

Glover T. Ferguson Jr. is a manager in the Technical Services Organization within the Management Information Consulting Division of Arthur Andersen & Co., Chicago. He has worked in systems development for nine years and is manager of the CICS Futures Task Force within IBM's Guide group.

IN DEPTH

Up from disaster

By Eli Hiller

Late last year, a Philadelphia-area company entered the final stages of converting its data processing operation. The firm anticipated a Jan. 3, 1984 cutover date from its Honeywell, Inc. 2200 mainframe to an on-line Data General Corp. Eclipse MV/10000 supermini. Necessary system modifications, procedure writing, system training and data conversion were complete by the Dec. 29, 1983 year-end accounting cutoff.

Through its 10 subsidiaries and affiliates, the firm serves the insurance, health-care and leisure markets. In November 1983, the company spun off its data processing subsidiary through a public stock offering. The data processing subsidiary developed three industry application packages: subscription fulfillment, floor-covering industry software and an insurance package. The latter was being installed by the insurance subsidiary with a planned Jan. 3 cutover.

When the holiday weekend arrived, the only remaining task was to perform a data base load that required some 30 hours of computer time — 27 of which had been completed — and the operation was started the morning of Dec. 31, 1983.

At approximately 11 a.m. on New Year's Day, a fire started in the heater area of the two-story, 25,000-sq-ft

A $25-million-a-year conglomerate with a substantial insurance business was three hours away from converting from a Honeywell 2200 to a Data General Eclipse MV/10000 system. Then, on New Year's morning 1984, fire wiped out corporate headquarters.

headquarters building. The building housed all of the various subsidiaries and affiliates and their records as well as several computer systems. The fire quickly spread and by 1 p.m. had gone to five alarms. When the fire was finally tapped out some 10 hours later, the building was a multimillion-dollar total loss. Both the Honeywell 2200 and the DG Eclipse suffered fire and water damage; they were completely unusable.

The co-located data processing subsidiary decided to move elsewhere, leaving the former parent company with an immediate need.

Our consulting firm, which had been hired to assist in the conversion, had previously written several disaster plans. Unfortunately, disaster planning was not part of the data processing system conversion engagement, even though the client was queried as to its preparedness in case of disaster. The client gave the usual assurances: There was an off-site tape storage system, a back-up insurance company microfiche system and accounting records kept in a fireproof safe on premises. For the most part, duplicate or backup accounting records were not maintained off-site.

The fire quickly spread and by 1 p.m. had gone to five alarms. When the fire was finally tapped out some 10 hours later, the building was a multimillion-dollar total loss. Both the Honeywell 2200 and the DG Eclipse suffered fire and water damage; they were completely unusable.

Upon inspecting the scene on Sunday afternoon and speaking with the company's executives, who were all in a state of shock, it became apparent that not only was an instant disaster plan required, but it would be necessary to oversee the execution of the plan as it would be several days before the shock subsided.

There are many consultants who have developed disaster plans, but few, if any, who have managed the execution of such a plan.

Recovery of the data processing capability as well as the corporation in general is most difficult for single-site companies with under $100 million in revenues. Larger companies weather disaster better through distributed processing: If one IBM 3081 goes down in a disaster, the company shifts the data processing load to another 3081 in the next city or state.

Two realizations were key in writing an instant plan on Sunday evening:

- Two-thirds of all companies fail after a major disaster, according to insurance statistics.
- The reliability and judgment of the generally capable executives of this company could not be completely trusted for several days because of the varying degrees of shock each continued to sustain.

The disaster plan, therefore, had to be simple as well as foolproof in restoring the company to a functioning condition within a very short period of time. The target date of Jan. 9, 1984 was selected as achievable given a Herculean effort and no mistakes in performing what had to be done.

The disaster plan developed had only six items, each of which was put under one of the executives as his only responsibility. Employees were assigned to each of the executives as work teams in executing that responsibility. The teams would be controlled and their progress monitored from a nearby hotel conference room. The company's executive vice-president and our consulting firm were put in charge of the conference room, which also served as the "command post."

In order to maintain open communications but control rumors and make vital information generally available, a daily meeting would be held to brief all of the executives on each team's progress. Additionally, problems encountered by a given team would be brought up for discussion and solution.

The disaster plan was as follows:

- Site security, salvage and records restoration.
- Public notification.
- Locating a new facility.
- Capital equipment acquisition for the new facility.
- Insurance negotiation.
- Processing restoration (manual and computer systems).

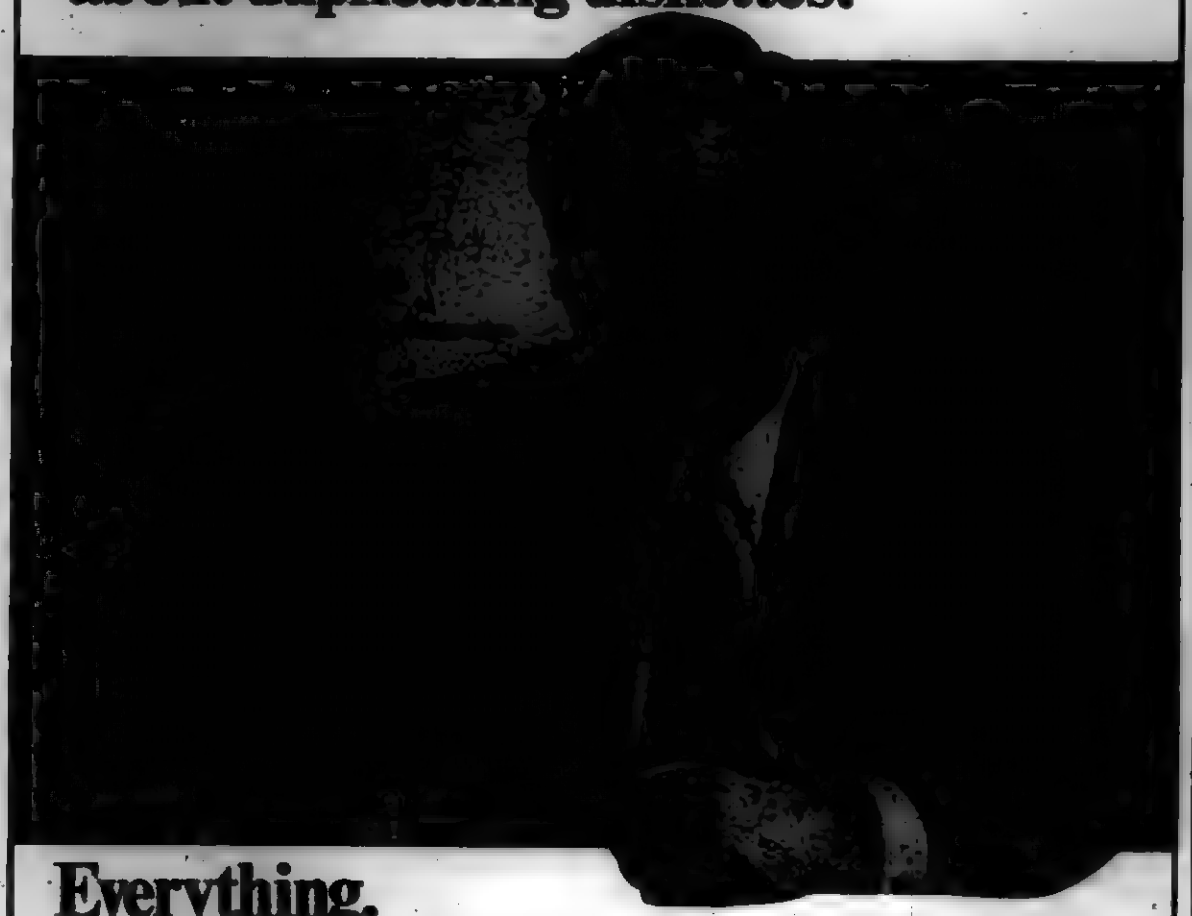
At 8 a.m., Jan. 2, the first executive meeting was held. The disaster plan was described to the company's executives, and each was assigned a responsibility.

Maintaining security

As there were some 10 subsidiaries and affiliates housed in the headquarters building, each wanted immediate access to its areas to salvage what it could. It was extremely difficult to explain to some of the middle-level managers who were trying to gain instant admission that what had not been burned had suffered extreme water damage, and they would have to wait until formalities were cleared. As a matter of fact, half of the building had collapsed and the other half was deemed unsafe.

After a major fire in Pennsylvania, the law provides that the state

What does America's foremost videocassette duplicator know about duplicating diskettes?



Everything.

Because magnetic media duplication is our business. And it has been for the past 15 years.

We've already got over 200,000 square feet of technical facilities at work daily for companies like IBM, Sony and Time-Life. At work on projects just like yours.

We've already got the systems in place to make your diskette copies, whether you need 200 or 2 million.

We've already got the people who know about labeling, package assembly, inventory and fulfillment services.

We're already geared to put your product in the proper hands according to schedule. Your schedule.

All of which is precisely why VCA Duplicating ought to be your duplicator.

When it comes to diskettes, it's all the same to us.

IN DEPTH/UP FROM DISASTER

fire marshal must inspect the premises before salvage operations can commence.

Additionally, a release from the insurance company must also be acquired. This was finally accomplished by the morning of Jan. 4.

Fortunately, some of the company's accounting and payroll records were spared because of the fireproof safe; these records were taken to a large ballroom of a nearby motel for cleaning and sorting. All salvaged company records, regardless of subsidiary ownership, went through the same process in order to maintain control and knowledge of the salvage operation. All salvaged documents were copied and the originals destroyed as the fire odor had permeated the paper.

The disaster plan developed had only six items, each of which was put under one of the executives as his only responsibility. Employees were assigned to each of the executives as work teams in executing that responsibility.

Documents that could not be copied were sent to a company in New Jersey that has a freeze-drying process to restore documents and remove the odor. The relocation of salvaged documents to a new facility would bring the undesirable odor into the new premises, and it would linger.

Surprisingly, the insurance company's microfiche was also salvaged, although it suffered smoke and water damage. Bell & Howell was notified, and two specialists from its Chicago-area headquarters arrived to instruct the salvage team employees how to treat the microfiche. That involved a rather labor-intensive ammonia process.

The team operated successfully and performed their assigned functions, including securing the old premises and salvaging a large number of documents from the disaster.

Most of the insurance files relating to ratings, agents and benefits were salvaged. About one-month's key entry could not be reconstructed.

Public notification

The company, which is a publicly held corporation, was required to notify the Securities and Exchange Commission, as well as the Insurance Department of Pennsylvania. During the course of the week, it also had to deal with insurance agents and policyholders, the press and the public at large.

Since a substantial portion of the company's vital documents had been salvaged, a news release was prepared that reflected the company's expectation to continue operations. Trading was suspended for one hour pending publication of the press release and resumed thereafter.

The Insurance Department of Pennsylvania visited the company's "command post" and discussed and analyzed the disaster plan. They were satisfied that the company could resume its insurance business given the proper execution of the disaster plan. The department then offered its assistance, particularly in providing copies of older insurance forms and rate tables (generally required for duplicate policy issue). The forms were on file in Harrisburg, Pa., as required by the insurance department's regulations.

The Consumer Services Department of the insurance subsidiary was organized to deal with the agents, policyholders and public through telephone contact.

Locating a new facility

The chief executive officer of the company wished to relocate in the same general area. He also decided to rebuild at the same location of the destroyed headquarters. The ground and building were owned outright by the company, and the executive had to deal with a host of realtors each

Innovator 300 LPM Printer System

Now! Compatible with nearly any micro, mini, and mainframe.

The Innovator printer system can interface with your IBM, Burroughs, DEC, RS-232 Serial and many additional communication protocols. Also, the highly reliable, field proven Teletype™ mechanism provides years of virtually maintenance free performance, significantly lowering your cost of ownership. Starting at..... $4,995

FEATURES:
- Impact printer with fully formed characters
- Ultra quiet acoustically damped cabinet
- BSC/SNA compatibility
- 132, 80 column, heavy-duty print mechanism
- Low cost nationwide service

Four-Phase is helping more than 2,000 DP managers win the productivity game.

Now it's your turn.

It's easy to win the distributed information processing game when you play it with the Series 4000 from Four-Phase. The Series 4000 is an integrated, growth-oriented system designed to communicate within your IBM environment. No other vendor gives you so many functions for so many years at such affordable prices. In the distributed processing arena, that's the way to score points with both end-users and top management.

You can win the DDP game with software.

Four-Phase provides one of the most impressive and complete collections of software ever offered from one company. Our packages make integrating Four-Phase computers remarkably easy. And guarantee a logical growth path for years to come. Here's just a sample of what we provide:

Interactive processing: VISION®—For creating custom applications from order entry to transaction processing. It provides a high level of functionality that can be used in any distributed environment. And VISION is easier and faster to program than COBOL.

Word processing: FOREWORD®—Our powerful shared-logic word processing system allows text to be entered, stored, edited, distributed and printed.

Graphics—For business graphics, the Graphics Management System (GMS/IV) gives you an easy way to condense and conceptually present data that's easily understood by decision makers.

COBOL—Industry standard COBOL is used to write programs for handling keyboard-entered data and general batch processing.

[illegible]

If your end-users are like most these days, they're clamoring for their own personal computers. We play that game, too. Because at the flick of a switch, our multifunction terminals suddenly become stand-alone PC's. So now you can give your users the distributed processing capabilities they need, AND the personal computers they want. All in one integrated system.

MFE

The action starts with the Multifunction Executive.

The key to the Series 4000 game plan is the Four-Phase Multifunction Executive (MFE). This unique and powerful control program monitors each multifunction terminal in your system. Its ability to run multiple software programs allows your users to perform 16 different tasks from any terminal on the system. And each of your users can access all of our software packages with one keystroke. You get maximum distributed processing capability and control.

Plus, MFE dynamically allocates selected peripherals so that each device can be used by more than one program. The result—MFE eliminates the need for multiple processors, duplicate terminals and other peripheral devices at installations that require concurrent execution of software.

[illegible]

Four-Phase was the first company to introduce the integrated approach to multifunction distributed processing. Today, there are more than 15,000 installed Series 4000 systems, helping people like you manage the information needs of over 150,000 end-users. And every machine is backed by our Customer Support Operation and over 1,000 field service people to provide continuing support and reliability at every level.

Four-Phase customers have been winning the DDP game for years. You can, too. To find out how, call us today at 1-800-529-6050, ext. 1599. In Arizona, call 1-800-352-0458, ext. 1599. For a free poster of this illustration, write to us at 10700 North De Anza Blvd., M/S 52-6A9, Dept. P., Cupertino, CA 95014.

VISION, FOREWORD and Multifunction Executive are registered trademarks of Four-Phase Systems, Inc. MOTOROLA and Ⓜ are registered trademarks of Motorola, Inc. Four-Phase and the Four-Phase logotype are registered trademarks of Four-Phase Systems, Inc. GMS/IV is a trademark of Four-Phase Systems, Inc.

Four-Phase Systems
The Office Automation Company

The problem was further complicated as a result of the AT&T divestiture. Three pieces of the old Bell system had to be contacted for a permanent restoration: Bell Atlantic for local and intrastate Wats, AT&T Communications for interstate Wats and AT&T Information Systems for equipment.

offering his available properties.

A short-term lease and a previously occupied office facility that would require minimal leasehold improvements was the most desirable course of action. Fortunately, they were found on Jan. 4.

The architectural plans were given to the coordinating team, and the facility was designed for the housing needs of all the subsidiaries and affiliates that evening, using as much of the existing layout as possible.

A meeting with the architects took place on Thursday, and the lease was executed Thursday evening. Alteration work began Jan. 6.

From the outset it became apparent that in order to restore functionality by Jan. 9, four items of capital equipment would have to be in place by that date. These items included a telephone system — private branch exchange (PBX) — office furniture, typewriters and copying equipment.

As part of its leisure group, the company owned a nearby motel. Bell Atlantic was contacted, and by the afternoon of Jan. 2, it had restored six of the 30 telephone lines the company had been using. The lines were hooked up to the motel, and the Consumer Services Department worked out of several motel rooms the entire week.

The process of reestablishing the entire telephone system was much more difficult. It was further complicated as a result of the AT&T divestiture, which became effective the first day of 1984.

Telephone troubles

Three pieces of the old Bell system had to be contacted for a permanent restoration: Bell Atlantic for local and intrastate Wats, AT&T Communications for interstate Wats and AT&T Information Systems for equipment. As of the first week of January, none of the three talked to each other except through a service-order paper process that none of the companies apparently understood.

For example, AT&T Communications had to issue a service order to Bell Atlantic to hook up the interstate Wats. That situation was alleviated by appealing to the old Ma Bell's common sense under an emergency condition, and slowly the lines were brought by Bell Atlantic to the new building's demarcation strip.

The slowness of the process was largely due to the company having 30 different listed and unlisted telephone numbers on two exchanges. With the exception of eight of the telephone numbers, (which no one could remember), none were in sequence as each subsidiary or affiliate had its own number.

Under divestiture, the responsibility of the Bell operating company ends when it literally brings the physical wire to a front door. It was decided that the company would take three proposals for internal equipment: the existing independent supplier (Ericsson), Bell/AT&T and Rolm Corp. The two independents both offered a temporary PBX that could be installed over the weekend of Jan. 7, including wiring the new facility.

Slow to respond

Bell Atlantic, strangely enough, proposed a Japanese-made PBX rather than a Dimension or Horizon system. The company encountered difficulties in attempting to contact AT&T Information Systems and

Normally, you might not trust a product with a new name. But while all of our products have a new name, they also have a proven history of quality and reliability.

That's because Genicom was formerly the Data Communication Products Department of General Electric. Now an independently owned company, Genicom will continue the same product line we established with GE...only the name has changed.

Our Genicom 3000 family, for instance, still offers the same performance features already preferred by users and the design flexibility so important to OEM's, distributors, retailers and dealers. Speeds from 40 to 400 cps. Single or dual mode printing. Type quality from EDP to NLQ. Multi-color printing. Graphics. Selectable type fonts, American craftsmanship and more.

Of course, we'll also offer Genicom 2000 teleprinters and the soon to be introduced 4000 shuttle matrix printers. You'll find we have the same complete product line that we had with GE. We have the same corps of experienced employees, the same facilities, and the same nationwide service network.

But above all, we have a new commitment to excellence. Which means, while we continue to serve existing customers with established products like our 3000 family, we plan to introduce more products to meet growing needs.

At Genicom, we've changed our name and we're planning to change the future with more innovations, and more of the quality you've come to expect from us under any name.

Genicom Corporation, One General Electric Drive, Dept. M321, Waynesboro, VA 22980. In Virginia, call 1-703-949-1170.

The genius of Team Xerox.

XEROX

The 8010 professional workstation has always been known as a computer of dazzling capabilities, especially in its graphics, information processing and document preparation.

But what some people may not know is that the 8010 is also the key element in Team Xerox, a system of office machines designed to work together like a team.

When part of an Ethernet network, the 8010 can work with a wide array of word processors, mainframes, personal and business computers, printers, electronic mail and file services, facsimile terminals, communicating Memorywriters, other networks and, of course, other 8010s. It also provides 3270 and TTY emulation.

Its full 17" bit-mapped screen lets you view two full pages simultaneously and open up to six documents at a time without covering up a previous document.

It's also the only workstation that can create and print documents in more than a dozen languages, including Russian and, for the first time, Japanese (Katakana, Hiragana and Kanji).

While other workstations may use Xerox innovations like the mouse, icons, windows, property sheets and combined text and graphics, the 8010 simply does more with them.

For example, the 8010's extensive software is fully integrated, to allow you to work with text and graphics simultaneously. You can draw a flowchart right in the middle of a full page of text without having to resort to a separate program and limited buffer "scratchpad" or "clipboard."

In terms of capabilities, ease of use and overall value, the 8010 would have to be considered the stellar workstation in the industry.

For more information, call 800-527-1922 (in Texas, 800-442-0152), or send in the coupon. Or ask anyone who's ever used the 8010.

Xerox Corp., Box 470065, Dallas, Texas 75247.

find the organization responsible for Dimension or Horizon equipment sales. Eventually, the appropriate organization was found, but the response did not seem to take into account the urgency of the situation.

The Rolm equipment was finally chosen and a temporary switch installed over the weekend of Jan. 7. The choice of Rolm and its Philadelphia-area distributor, PTC, was based upon the systems capability in handling both voice and data as well as its ability to provide and install a temporary switch over the weekend.

The final items of capital equipment selection needed for Jan. 9 functionality were typewriters and copiers. IBM Selectric IIIs and Xerox Corp. Marathon 75s were chosen based upon quality hardware, price and immediate delivery. Forty typewriters were shipped over the weekend and arrived on Jan. 9. Xerox provided loaner copiers and the first Marathon was delivered Jan. 13. A decision was made to leave the issue of noncapital equipment and supplies up to the individual departments because the ordering and delivery process is a routine matter.

Another area of concern in a multimillion-dollar disaster is insurance company negotiation. Based upon the experience of this disaster, the use of a public adjuster retained by the insured is generally worth the 5% fee. A public adjuster can achieve better settlements. His professional approach is superior to an inexperienced executive assigned to the task and helps eliminate the possibility of bias.

Processing restoration

Processing restoration was the most vital area of concern for the insurance company, which must collect premiums and pay claims. Both tasks are feasible on a manual basis for a short period of time, providing functionality has been achieved. There was little concern for the health-care and leisure operations of the company since both of those activities depended upon their own field facilities, which were not affected by the fire.

A team consisting of the underwriting manager and the claim manager of the insurance operation was assigned the task of developing a plan for manual processing. That plan was to be completed by Jan. 5 and reviewed by the executive committee.

However, it was also known that the off-site magnetic tapes and some of the salvaged tapes could be used to continue processing on a Honeywell 2200. A service bureau with a Honeywell 2200 about 100 miles away was found, and arrangements were made to use that facility. An agreement was formed to use the site until the DG equipment could be replaced and conversion restarted.

This choice eliminated the urgency of acquiring equipment overnight, including 30 terminals that could now be supported through the Rolm CBX without the need to wire the building for data. Also, recovering from the loss of the new procedure manuals, which were not salvaged, had to be considered in order to restart the conversion. The above plan, therefore, permitted an orderly conversion planning effort that could be undertaken during the rest of January to install the new system and have it operational by March 1.

This processing restoration approach covered all bases. There was little basic disruption, and the approach gave the insurance operation the ability to continue processing, including its unfinished year-end work. The only difference would be a delayed systems reference since listings would be provided, rather than a daily updated Honeywell file loaded onto the MV/10000 and accessed via a terminal. The plan also offered a carefully thought-out manual backup if the remote-site Honeywell 2200 became too burdensome.

Cutover is now planned for April 2.

About the author

Eli Hiller is a management consultant based in Cherry Hill, N.J. Eli Hiller and Co., Inc. specializes in contingency planning and business systems planning. Previously, Hiller was a manager in Coopers & Lybrand's Management Consulting Services Department.

"Oh no! Somebody got into the computer room last night."

"I don't know who was maddest - our data processing manager, our controller or our auditors. But they all came into my office and complained that anyone could get into the computer room - at any time. So, we installed an RES CARDENTRY® system, and now we control who uses the computer room. And our smart machines are protected by some other pretty smart machines.

As well they should be.

Without an RES CARDENTRY system to protect your data processing facility, it can be subject to information security breaches, as well as damage to your expensive computers.

An RES CARDENTRY system solves the problem of securing your data processing equipment. It also does away with employee keys (and the possibility of duplicating them), and lack of personnel accountability.

When we install a CARDENTRY system, we give each employee a RUSCARD™ with a personalized code. The cards are virtually impossible to duplicate. Your computer center utilizes compact CARDENTRY readers. You tell your system who's allowed in and when. Then, if an unauthorized person tries to enter the facility the door won't open.

What's more, the RES CARDENTRY system tells your security guard where and when an unauthorized entry has been attempted - in easy-to-read English text.

It's that easy to account for (and control) unauthorized access and activities. And it's that easy to save money.

Your RES CARDENTRY system can even turn utilities on and off at pre-determined times, streamline your data collection activities and provide real-time monitoring, pre-defined, and user-defined historical reports. Small wonder we're the world leader in access control & monitoring systems.

So if your computer isn't already protected by our system, it should be. After all, do you know who's using it right now?

IN DEPTH

Reusable code, reliable software

By F. Arnold Romberg
and Alan B. Thomas

Expert systems using knowledge bases derived from a library of program specifications will be essential to fifth-generation software development. Intelligent management of reusable code will be one of the major benefits provided by these development tools.

Whenever a radical improvement is made in either hardware or software, a new generation is hailed. Progress through the fourth generation has been somewhat independent in hardware and software. Improvements in one area

'We are concerned here with one way program verification and reusable code may be combined under the direction of an expert system to produce more reliable software in less time with fewer people. The necessary technology is in the development stage. . . . Fifth-generation hardware will support fifth-generation software development methodologies.'

have stimulated and benefited from improvements in the other. However, looking back, we can see that the progression from one generation to the next in hardware was not essential for the radical improvements in software that justify the recognition of a new generation, and vice versa.

The frontiers in both hardware and software have now arrived at the transition between the fourth and fifth generations. It does seem to be a happy circumstance, since the next major advances in both hardware and software will be much more closely intertwined than any prior advances.

The Japanese have committed their computing industry to leapfrog into a position of worldwide leadership. Their efforts center on development of large and small inference engines. These processors reference large amounts of information stored in knowledge bases to identify probable additional facts and verify and modify these through dialogues with users to develop more information. Coupling an inference engine with a particular knowledge base yields an expert system. Such a system combines hardware and software to provide great help to a user by supporting him in the same way that a human expert would.

Effective use of inference engines requires development of hardware and software tools to make these powerful devices less complex and more rewarding. The fifth-generation knowledge manipulation machine will dramatically

change the way software is developed.

We are concerned here with one way program verification and reusable code may be combined under the direction of an expert system to produce more reliable software in less time with fewer people. The necessary technology is in the development stage. The individual components are commercially available today. Fifth-generation hardware will support fifth-generation software development methodologies. Intelligently managed reusable code is one of the important elements of fifth-generation software development methodology.

Development woes

The many problems with software development are well-known: It takes too long to develop an initial package; package reliability will be poor at first and will improve only with intensive code maintenance; errors are uncovered only by attempts to use the package, and some may persist well into its useful life; and the whole process costs too much.

James Martin, in *Application Development Without Programmers*, cataloged these faults and identified a primary approach to solutions: Increase the use of high-level languages both by data processing professionals and by end users. That the term "software engineering" has come into use is itself an indication of our hope that software development can move from being an artistic endeavor to being a process of pragmatic construction.

That the term "software engineering" has come into use is an indication of our hope that software development can move from being an artistic endeavor to being a process of pragmatic construction. "Information engineering" concerns the whole range of information handling activities.

The replacement of "software engineering" with "information engineering" recognizes that this process is more and more one that must concern itself with the whole range of information handling activities. The process starts with determining the goal of the information processing to be done and involves analysis and design of all phases of information handling, not just construction of computer programs.

Computer systems producers, both analysts and programmers, are good targets for productivity improvement. In part, this situation is the result of labor economics: Relatively high salaries, resulting from great demand in a labor-intensive field, are a prime motivation for automation. In part, it is also a result of the increased opportunities for and willingness and ability of computer systems people to change jobs.

Turnover has made it imperative that means be found to make the developer of a system less a part of and less essential to its continued successful use. Fifth-generation systems development technology must reduce the need for system maintenance and for human expert knowledge when systems are extended, because the humans who have that knowledge are not staying with the systems they develop.

Significance for fifth generation

Each passage from one software generation to the next has been marked by a significant advance in the ease of producing programs. The second generation was marked by the advent of assemblers to relieve the programmer of much of the work of determining machine memory addresses and operation codes. Third-generation language processors took over the task of selecting the machine instructions. Now fourth-generation languages are letting the computer perform some of the decisions about how the processor should perform some of the tasks specified by the programmer.

Although these languages have been labeled "nonprocedural," it is much more accurate to call them "less procedural." The programmer is freed to concentrate on the aspects of the procedure that are of significance to the problem at hand, leaving the computer to take most of the responsibility for the aspects that are largely concerned with the details of the computer processing.

The term "fifth-generation software" has not yet been accorded a standard definition. However, it is generally used to refer to system development approaches in which the man/machine interface is only at the specification level, while the organization of the specifications into the facts needed to create an information processing system is carried out by the software development system.

Both fourth- and fifth-generation software development methodologies emphasize the statement of application system requirements and logic in problem-oriented languages. Requirements stated in these terms may then be reviewed, tested for consistency and completeness and used to produce preliminary results for prototyping. They become the basis for generating system components such as programs and data structures.

The availability of a well-

IF YOU'VE
EVER OUTGROWN
A FINANCIAL SYSTEM,
THIS IS A SEMINAR
YOU WON'T WANT TO MISS.

GL, AP,
MM, PO,
AND SOON ARC

The Walker "Once and for All" Seminar. If you're looking at financial applications software, you're probably planning to replace an unwieldy system. One that fails to meet your needs for information management, technological compatibility or operating efficiency. Even perhaps, all three.

Walker offers a full range of financial systems specifically designed to grow with you. Easily. Which means the Walker Seminar could be the last financial software seminar you'll ever attend.

You know the problem. Every time you have to change or add to your current system, you discover new roadblocks. Custom reports have to be programmed on top of your old system. Changes and additions have been so frequent that nobody understands just what the system can do. Or how it does it. New technology could make your business run better...but your financial system won't run on it. And you must divert valuable time and resources to find a new system. Again.

Financial software you won't outgrow. Walker introduced a revolutionary technology: Software that separates the applications (what the software does), from the database (how the system interfaces with your data center). It's a proprietary technology which continues to grow with the needs of hundreds of corporations. Worldwide. Including the 1984 Olympics.

Better management tools. Walker's "Strategic Software" allows you to modify your financial system to work the way your company works. And change as your company changes. Simply. Immediately.

Freedom. Walker financial applications packages are not dependent upon a specific technology, operating system or data base management system. By utilizing a unique "software bridge," Walker isolates the applications software from both the mainframe and the DBMS. Which means you're free to choose the technology and DBMS that's best for your company's needs. Without the need to replace or rewrite your financial system, or retrain your staff.

A free seminar. In a few short hours, you can see how integrated, interactive financial systems can save you time for years to come.

Even a free phone call. You can fill in the coupon below, or call us today, toll free: 1(800) 4 WALKER (outside California), (415) 495-8811 (within California). That way we can register you for the seminar that's most convenient for you. In realtime. Like Walker software.

"The office automation I bought for everyone in the corporation doesn't incorporate everyone."

Exxon stops the shock...with fully integrated office automation for everyone in the corporation.

Introducing the Exxon Business Support System.

An office automation system that can't support everyone in your corporation can lead to some very shocking experiences.

The right power to the right people

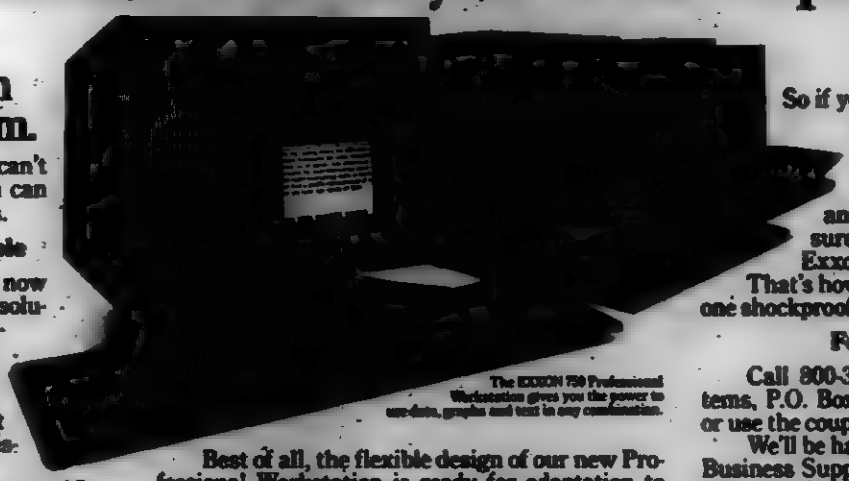
That's why Exxon Office Systems now offers more practical office automation solutions that help everyone in the corporation to be more productive. With the Business Support System, Exxon extends its fully integrated line of office automation products to support managers, professionals, and administrators, as well as secretarial staff.

Exxon puts it together for everyone with a fully integrated system — with full communications flexibility that lets you access outside data bases and interact with most mainframe computers. Without the complications. Without the shock.

Office automation for those who shape the corporation

The Exxon Business Support System features the new EXXON 750 Professional Workstation, specifically designed with powerful, integrated software that lets you move instantly from text to graphics to data processing — without changing programs.

You can divide the high resolution bit-map display into several windows and work in a number of functions simultaneously. You can shift information from one window to another. You can preview the page layout, and produce an integrated text/graphics document on our quiet EXXON 965 Ink Jet Printer. Or on a color plotter.



The EXXON 750 Professional Workstation gives you the power to use data, graphics and text in any combination.

Best of all, the flexible design of our new Professional Workstation is ready for adaptation to the most popular operating systems and network interfaces.

Tying everyone together

At the core of the Business Support System is the EXXON 8400 Series controller. With its UNIX*-based operating system, it can integrate all levels of workstations to share information and programs. Everyone can keep track of schedules and meetings with time management and calendaring functions, whether their workstation is an EXXON 500 Series Information Processor or a new EXXON 750 Professional Workstation. And everyone can send and receive messages easily with transparent electronic mail.

An expandable, shockproof family

Exxon protects your office automation investment by making every workstation — from the EXXON 500 Series to the new EXXON 750 Professional Workstation — fully expandable and upgradeable.

So if you've already begun an Exxon system, the latest Exxon advances are completely compatible with our current product line.

And with our worldwide sales and service organization, you can be sure that when you need assistance, Exxon will be there.

That's how Exxon incorporates everyone—in one shockproof family.

For more information

Call 800-327-6666, write Exxon Office Systems, P.O. Box 10184, Stamford, CT 06904-2184, or use the coupon below.

We'll be happy to demonstrate how the Exxon Business Support System can help your corporation move into the future ... without the shock.

managed library of reusable code is essential to the effective use of these techniques.

What's the big deal?

Reusable code is an important approach to reducing the cost of software development while increasing the reliability of the finished product.

Everyone who has taken an introductory programming course in Basic knows about subroutines. Anyone who has written more than one program has reused sections of code. All who have worked alongside other programmers have reused other people's code. Whenever a program is bought, sold or copied, it is with the intention of reusing code. The other side of the coin is that probably the majority of all code is written to do tasks that have already been programmed before, somewhere else, in some other environment, for some other purpose.

Intensive use of a piece of code as soon as it is complete and while the development mechanism is still in place can lead quickly to a high level of reliability for the whole remaining life of the code. The prospect of using a piece of code in many contexts justifies the effort of more thorough testing.

Major efforts have been put into making existing code available where needed, and many fortunes have been amassed doing so. However, the success of fifth-generation systems requires several order-of-magnitude increases in the application of reusable code. The challenge is to surmount the technical and logistical obstacles to achieving these increases. When they are achieved, each of the problems with software productivity will be directly and significantly affected.

The development expense for a piece of reusable code may be spread across many programs in which it is used. Alternatively, it may be regarded as practically free for all users after the first.

Shared use leads to faster discovery and removal of errors. Intensive use of a piece of code as soon as it is complete and while the development mechanism is still in place can lead quickly to a high level of reliability for the whole remaining life of the code. The prospect of using a piece of code in many contexts justifies the effort of more thorough testing. The use of a mature piece of code in a new application shortens the testing time for that application, too.

An important impact on code testing practice is that the expense of applying formal verification methodologies is more easily supported when the resulting code will be widely used.

Production of one piece of code to do the work that would otherwise require many coding efforts creates obvious savings of time and effort in specification, design, construction and testing. These savings are minimally offset by the need to meet the interface requirements of a large set of environments in which the code will be used. The net effect is substantially reduced development time and cost. The savings are compounded as the resources freed are applied to additional development.

A subroutine library is the most common form of reusable code. Management of a subroutine library involves determining support responsibility, documentation standards and maintenance cycles. Talented programmers may submit routines for a companywide subroutine library. Decisions about the acceptability of such routines are difficult because of a lack of control over these concerns.

Another problem is that routines accepted for the library are often difficult to use in a new context. The result is often the growth of a number of subroutine libraries along organizational or functional lines, frequently containing multiple versions of equivalent routines. The fragmentation of libraries defeats one of the primary purposes of reusable code implementation: prevention of redundant development.

The challenges

To achieve the full benefits that reusable code promises, a number of difficult challenges will be met. The dominant theme in meeting these challenges is increasingly sophisticated automation of the processes involved in software development. That sophistication can only be provided by expert systems that support program development.

The first challenge is to maximize the reusability of any code written. Widely reusable code demands automation in the process of producing code to handle the amount of work to be done and to provide the degree of accuracy required. This automation must perform not only the many tasks taken over by programming support systems in the progression from second- to fifth-generation software, but it must also take responsibility for creating code that meets the requirements for successful reuse.

Achieving reusability is usually of little immediate interest to the programmer. He is much more concerned with meeting some current need and is justifiably willing to sacrifice future reusability, and hence future

YOUR KEY TO COMMUNICATION NETWORK COMPATIBILITY.

THE CHALLENGE
The challenge for communications network managers today is compatibility—how to integrate a growing number of information processing resources into existing and future networks.

If your organization needs to combine the power and utility of personal computers, minicomputers, office automation equipment or ASCII terminals with your mainframe network, Wall Data can provide you with a cost-effective solution using the DCF Series of communications controllers.

THE WALL DATA SOLUTION
DCF systems act as gateways into IBM SNA, BISYNC and other vendor network environments. They enable you to flex your network muscle by providing concentration, speed conversion, and protocol conversion to multiple hosts using multiple protocols at the same time.

With the DCF Series, ASCII terminal networks can be used as 327X's with IBM System/370's or as 525X's with System 34/38. And asynchronous hosts can transfer batch datastreams into SNA networks using 3770 SDLC. This means greater productivity from your ASCII terminal network because you do not sacrifice access to your asynchronous host in order to enjoy IBM compatibility—you simply alternate from asynchronous to synchronous host via a simple-to-use menu interface.

To this sophisticated multi-protocol support, add the following standard features:
- Standard redundant hardware
- Automatic backup without user intervention
- Interactive local configuration
- Remote Software Diagnostics
- Remote Software Downloading
- Asynchronous port selection
- Operator menu interface

Together these features add up to the most flexible protocol gateway available to tie your multi-vendor systems into a cohesive, cost-effective network.

Whether you just want to complement your IBM network with lower-cost ASCII devices, or to merge asynchronous and synchronous hosts into a more manageable network resource, call Wall Data today—THE DATA COMMUNICATIONS FACILITATOR.

WALL DATA
The Data Communications Facilitator

A further challenge in creating reusable code is providing standardized error reporting. Complex modules are built up of multiple levels of other modules, many of them reusable in various contexts. Noncritical failures may be reported by means of return codes from lower level functions, while major failures must lead to specific abnormal termination procedures.

productivity, for faster achievement of short-term goals. Programming support systems must help him to produce good reusable code with no delays and minimal — preferably no — extra effort.

The second challenge is to make sure that if an appropriate piece of already written and tested code is available to meet a current need, it will be used. When a programmer is faced with a particular need, the most satisfying way to meet it is to pitch in and do a little fresh programming. With the use of ever higher level languages, the human effort required to create a particular piece of needed code is relatively small. The savings achievable by reusing code are large because any given project involves creating a very large number of well-integrated and tested small pieces of code.

In order to achieve these savings, code potentially usable for a particular need must be located quickly and easily, which means it must be carried out completely automatically. The elements of the task include recognizing essential features, locating and presenting to the programmer one or more pieces of code likely to fit the current need and building the selected code into the system under development. For even a small need, the process must be easier than to generate new code.

The challenge of managing a subroutine library involves many difficult problems. The addition of new modules and the evolution of existing reusable code must be both allowed and controlled. As features are added to existing subroutines, multiple versions of a module with overlapping functionality come into being. Records must be kept telling what modules are in use in already constructed systems.

Multiple versions of similar or overlapping modules must be kept available to meet slightly different needs. For example, because of execution speed or size, a currency conversion module that includes a limited number of currencies may be preferable in some circumstances to a version that covers many currencies.

Both versions must be kept available. Correction of a bug in one may be cause to examine the other. Some application systems may be affected by the bug, so that the effort of replacing the older version with the repaired one is not only justified but essential. Another production system using the same module may be unaffected by the bug. If this situation can be verified, then the work and cost of replacing the module in this system can be avoided.

A further challenge in creating reusable code is providing standardized error reporting. Complex modules are built up of multiple levels of other modules, many of them reusable in various contexts. Noncritical failures may be reported by means of return codes from lower level functions, while major failures must lead to specific abnormal termination procedures. Error and warning reporting from one module to another must be handled in standardized ways so that testing the use of a reusable module requires only testing the

ASK ABOUT OUR 30 DAY TRIAL.

interface between it and the program using it. The module itself and the lower level modules it contains may be relied on to detect and report correctly error conditions detected at lower levels.

Facilities to meet these challenges will be a part of fifth-generation expert systems that support software development.

Software engineering

Workers at the frontier of information systems and software technology are very much concerned with bringing engineering discipline into systems and software development. Much effort is going into making sure that information gleaned at each stage of the development process is properly captured, verified and organized for effective use as the basis for work at the next stage.

The huge intellectual investments in strategic planning and systems analysis must be preserved for effective construction of the original system or software product. The availability of this information in usable form also has obvious benefits for system maintenance and can substantially extend system life. However, because of the great overlaps in the planning and analysis information for interfacing systems, the biggest payoffs occur when this information can serve as a foundation for the development of interfacing and related systems.

A variety of major research and development efforts are attacking information and software engineering at different points and from different directions. One very promising development area is the generation from design specifications of computer programs that are verifiably correct in the sense that they are known to implement the specifications. The USE.IT system by Higher Order Software, Inc. of Cambridge, Mass., allows an analyst/designer to decompose the process to be performed and the data involved in a hierarchical fashion.

The successive stages of process and data decomposition are performed according to specified rules. The entire decomposition can be checked automatically for consistency and completeness. The resulting lowest level functional primitive operations can be processed automatically to create computer code in any one of several compiler languages. If the specification passes the consistency and completeness checks, the resulting generated code can be relied on to realize the specification correctly.

The USE.IT approach to validating the specification is a powerful attack on specification errors that involve faulty data interfaces. The analysis phase tracks variables from one end of the program to the other to ensure that each variable is defined and given a value prior to being used as an input to a calculation or decision process.

The validation provided by USE.IT is limited to completeness and consistency. Successful validation promises that the resulting program can be expected to execute successfully and will do what the specification said it should do. Whether the program will do what the analyst expected it would is not the same thing, and whether it will do what another user expects is still less certain.

Achieving this level of correctness is the objective of formal correctness proofs. These make assertions such as: "If the input data submitted to program XYZ meets specific requirements, then the program will terminate with the desired result." Consider an internal sort program to be used by an on-line transaction program. Several conditions must be satisfied for the program to work properly: The size of the table to be sorted cannot exceed a maximum limit; the size of each table entry must be within another maximum; the table size must be a multiple of the entry size; and the sort key size cannot exceed the entry size.

If all these conditions are satisfied, the program will, without exception, terminate with the table entries in sorted order. An experienced or cautious programmer will include in the program tests for each of the requirements before starting the sorting process. Program code such as this, called guard code, has some drawbacks.

Detection of invalid conditions that waits until execution time costs valuable effort and delay just at the most critical time, namely, when the results of the information processing are needed. The execution time for guard code, even when no errors are present, can be significant, particularly in large modules or frequently executed lower level ones.

Well-managed reusable modules accessible to a program development system that does interface and integration checking can provide two major benefits: faster execution and faster development. Less code is necessary to do the same job, and less effort goes into producing the program.

The time required to prove a program correct is related to the number of variables involved. A reusable code module offers the advantage of reducing the total number of variables involved in the correctness check since the local variables of the reusable module do not need to be considered. Only the input and output variables of the reusable module have significance in the proof process if the module itself has been previously verified. A verified module can be used within other routines without incurring the overhead of reverification. Only the guard conditions need to be checked to fit the module into a new structure.

In contrast to software engineering, which is largely concerned with

To add markets as well as profits to your business, add Zaisan to your system.

The ES.1 voice/data workstation offers single-key access to simultaneous voice, data or text. With the touch of a button, users can also access internal and external databases, PBX functions and electronic mail.

The ES.1 is also upgradeable. So you can add application and communication software to tailor the ES.1 to the individual information needs of your users. Which can add sales to your business.

Another plus is the price. And the wide range of service options.

Add these all up and you'll see the formula for success is rather elementary. Add Zaisan.

ZAISAN
The new direction in business communications.

creating correct code based on a presumably good specification, information engineering is aimed principally at accurate and rapid recording and checking of strategic planning and analysis data. The ultimate goal includes automatic program design, based on adequately detailed and checked analysis information, with the design in turn supported by automatic code generation. Information engineering has been the target of university research projects for many years. It has become the object of much attention in consulting firms more recently.

The amount of computer-executable code that already exists is staggering; the backlog is larger still, and

The sheer volume of code to be produced makes it imperative that code production efficiency be a major concern. Code must be created and managed so that any routines created are made available to the widest possible circle of users.

the amount to be produced in the next decade is mind-boggling. This realization has motivated firms in such diverse industries as computer manufacture, hydrocarbon processing, software creation and electronics to undertake major projects aimed at mastering information engineering to break the software production bottleneck. Different projects emphasize different aspects of improving software systems productivity, usually based on the recommendations of different experts about how to convert software development from an individualized creative endeavor to a systematic engineering activity.

One approach emphasizes computer support for producing a limited number of different kinds of diagrams that help users specify, visualize, organize, review, complete and document the basic information for program construction. Another project concentrates on capturing specifications in a form suitable for automatic code generation. A third begins with an architecture that relates different phases of systems development activity, to be fleshed out with a variety of alternatives for doing the work involved in each development phase.

A fourth concentrates on producing a facility for storing all of the diverse body of knowledge that is involved in producing information systems, to be supported by numerous processors that accept and present subsets of the information in a variety of forms; including text, diagrams and matrices.

The one thing that all of these efforts have in common is that once the body of specification information has been mastered for an information engineering project, it must be possible to produce the required program code automatically. When efforts are successful to move the point where automation takes over in software development back from the design/construction interface to the analysis/design interface, the leverage provided by automatic program construction will be still further magnified.

The sheer volume of code to be produced makes it imperative that code production efficiency be a major concern. Code must be created and managed so that any routines created are made available to the widest possible circle of users.

Fifth-generation development

One of the products the Japanese intend to produce as a result of their fifth-generation efforts is a complete expert system — hardware and software — aimed for use by a single individual. The goal is to produce rapid personalized support for knowledge workers to improve their productivity. The benefits to the workers include greatly increased job satisfaction and opportunity for growth. The push for a personal-scale knowledge machine is partly a consequence of the problems of data integrity and concurrency that plague distributed computing, particularly micro-based activities.

In the U.S., the current emphasis in fifth-generation development seems to be more on the production of large knowledge bases and expert systems that can make the power of the stored knowledge available to many individuals in large organizations. Information system manufacture is just one of the many problems that are susceptible to this method of attack. However, it is one that is highly leveraged, since knowledge base handling systems and expert systems using knowledge bases for information systems development must themselves be developed before the goals of fifth-generation software can be met.

The components of a fifth-generation development system are a verifiable specification language, a library management system, a knowledge

base, a command-level analyst interface and an inference processor.

Fifth-generation specification languages will continue the present trend in the direction of nonprocedural languages. The tasks of finding out all that must be known to produce software and of recording this information so it can be automatically organized and processed by the expert system are complex.

The fifth-generation development system will take an active role in information processing analysis and target software system design. Module selection and specification verification are important elements of this role. The specification language allows an analyst to communicate readily with the knowledge base in terms of process flow, data structure and logical requirements.

After the specifications for a system have been developed and communicated to the knowledge base, they are combined with other information from the knowledge base to support construction of the target system. Tapping the knowledge base to identify candidate reusable code and to select the most appropriate modules requires comprehensive information about available modules. Important parts of this information are the conditions that must be satisfied at the time a reusable module is invoked and the conditions that will be satisfied when a reusable module terminates. In describing inputs to reusable modules, the weakest, or least restrictive, condition on the input data that will ensure successful execution is used. The weakest precondition is preferred over stronger restrictions since minimum testing and minimum module-specific preparation will be required to meet the needs of the weakest precondition.

In describing outputs, we are interested in the strongest postcondition, since this is the most restrictive statement describing the data after completion of the program. The knowledge base associates module names, locations and statements of weakest precondition and strongest postcondition.

The command-level interface assists the analyst by managing, supporting and simplifying access to the knowledge base, inference engine and specification language.

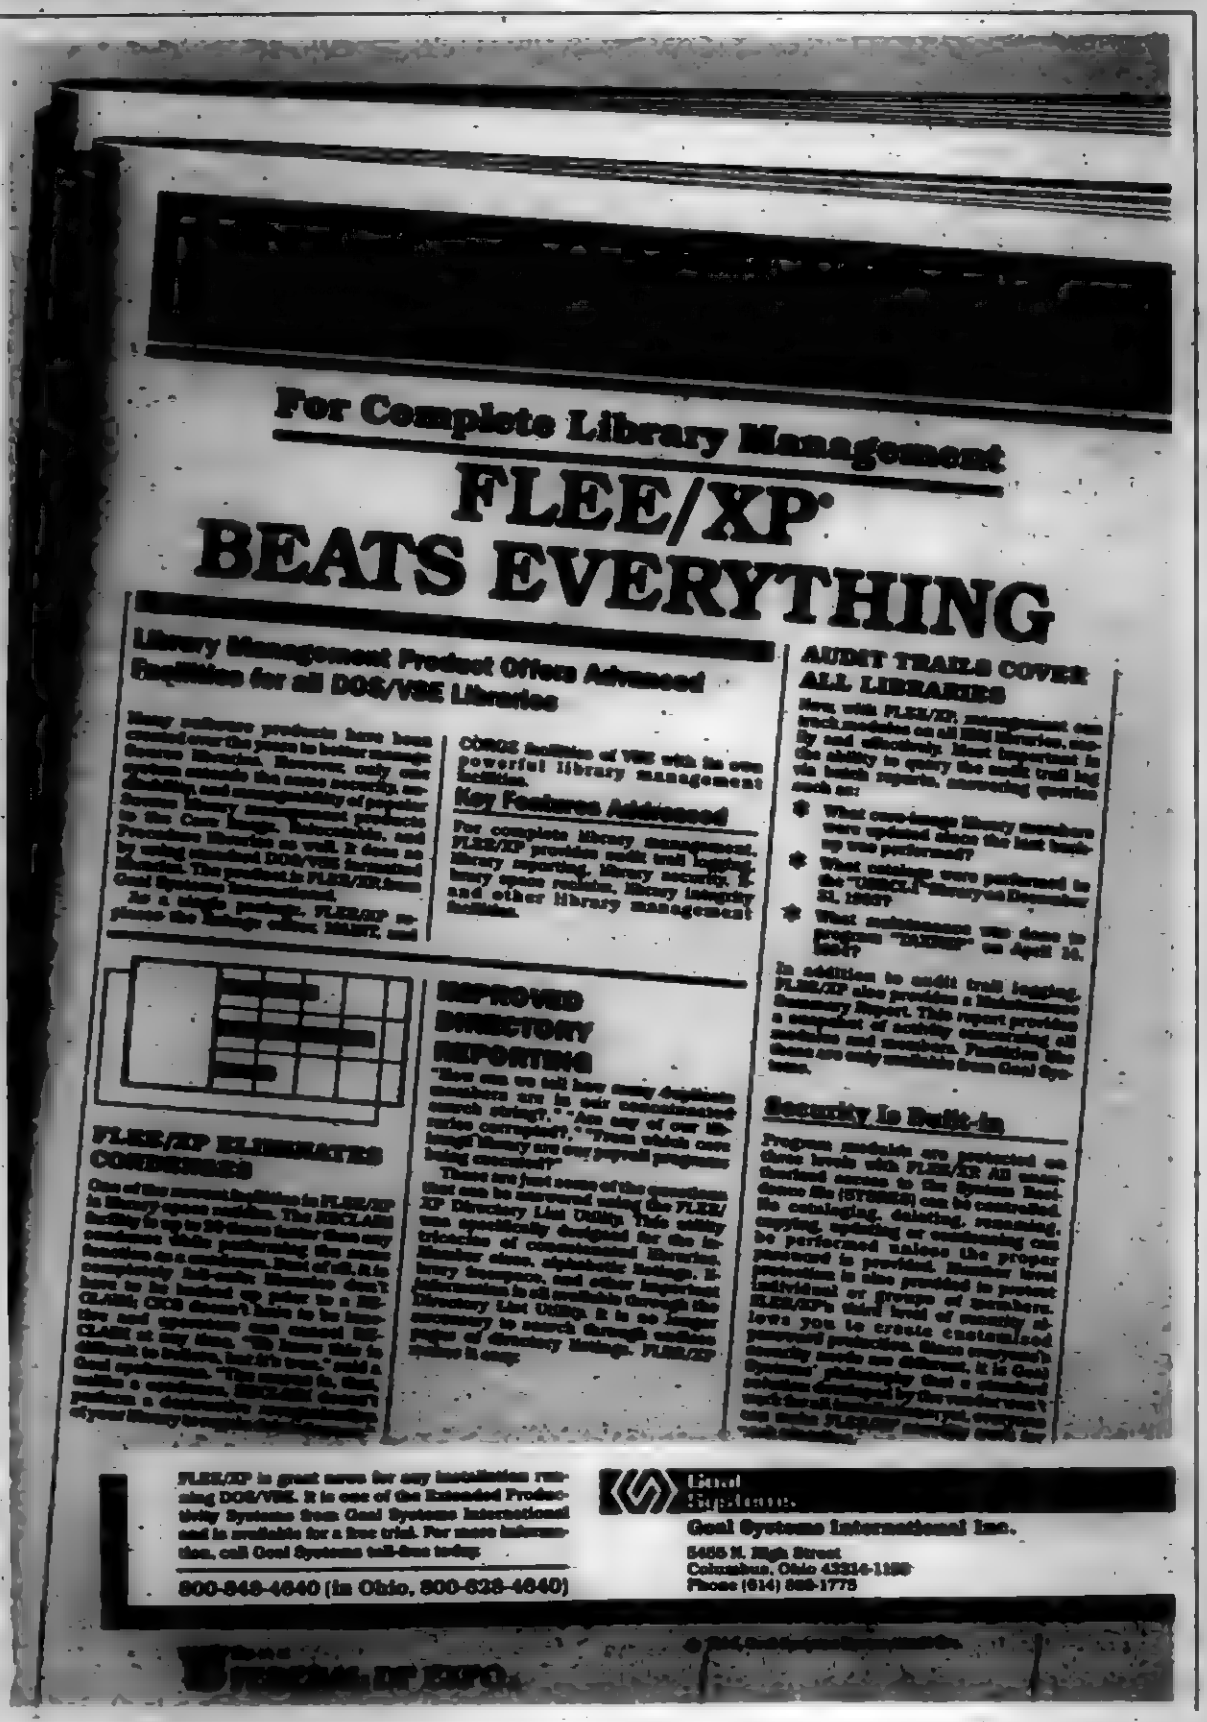
The inference engine combines user knowledge of requirements with the knowledge base's description of capabilities of available reusable modules. The expert system built on the inference engine and knowledge base presents what can be deduced about the specification and identifies and requests information required to complete it. With this achievement, the fifth-generation software development system will have taken over software construction responsibility in toto, while the analyst is freed to concentrate entirely on issues of usability and architecture.

Fifth-generation system development methodology has a number of implications. Data processing personnel requirements will change, as they have been changing steadily since computers were invented. Capital expenditures will continue to rise. Organizational structures will continue to evolve to take advantage of emerging technology. The role of the traditional programmer will shrink as "smart tools" increase the productivity of individual people.

The fifth-generation software development system will take over software construction responsibility in toto, while the analyst is freed to concentrate entirely on issues of usability and architecture.

Three classes of program developers can be identified. There will be specialists in less-procedural languages and prototyping systems who concentrate on quickly producing new information systems — these have been christened "data processing acrobats." There will be the supporters of the expert systems and the knowledge bases used for information system production. The responsibilities of this group will include creation and extension of large libraries of reusable code.

And there will be the bulk of the users of these expert systems and knowledge bases. This group corresponds to the majority of the current programmer/analyst population. Analysis work will predominate over programming in the daily activities of this large group. Fifth-generation tools will provide the needed program construction support, and one of the major elements of this support will be effective automatic management of reusable code.

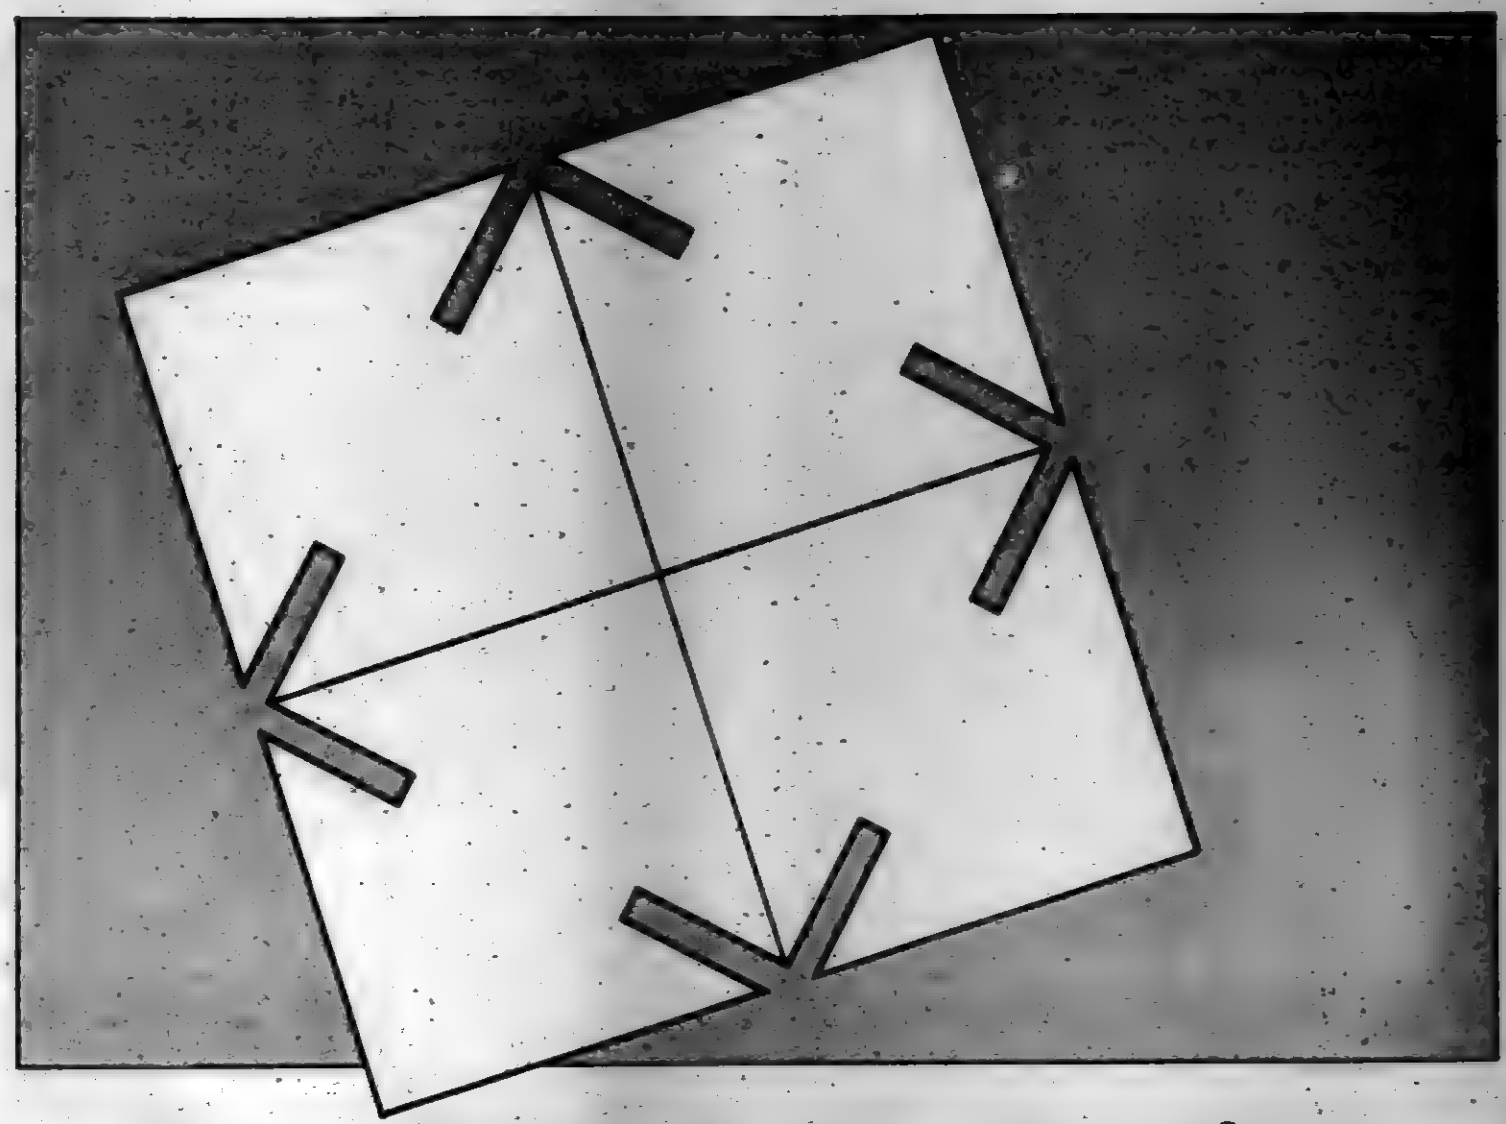


About the authors

F. Arnold Romberg is an independent consultant based in Dallas. He has been a computer systems professional since 1954. In the course of employment by a major oil company, a management science and computer software firm and an electronics manufacturer, he has worked with many kinds of software in program development, mathematical programming, corporate planning, manufacturing and information engineering. He has taught systems programming, data base management and systems analysis.

Alan Thomas has worked in the industry for nine years as analyst, project manager and supervisor. He has been with Texas Instruments, Inc. for the past six years and is now a technical consultant at Peer Services, Inc., specializing in data base management and development technology.

IN DEPTH



Practical data sharing

Disillusionment with the "universal corporate data base" concept caused a swing to DBMS as an access method. But between these two extremes there is a practical alternative — data sharing.

By V. Venkatakrishnan

Data is said to be shared if its definition and values are stored in only one physical location (record, file, data base) in the company. Shared data is accessed and updated by any number of applications without the need for duplication or redundancy. Data sharing is the strongest thrust behind the concept of data base management systems (DBMS) and is or will be inevitable for the following reasons:

- It reduces the number of batch programs to be developed and executed to interface applications that access common data. This reduction is important because the batch window is steadily decreasing because of growing demand for online operations. A side benefit is the overall increase in application productivity resulting from the decrease in the number of programs to be developed.
- It improves the validity of information by making current data available promptly.

However, because of the limitations of commercial DBMS software and the hardware limitations of today's processors, an idealistic pursuit of the preceding definition of data sharing will result in unmitigated disaster. Perhaps it was such a pursuit that led to the rise and fall of the "universal corporate data base," which was supposed to contain all the data the enterprise

would ever need. The disillusionment created by this rather impractical approach caused the pendulum to swing to the other extreme, namely, use of the DBMS as an access method with disregard of data sharing. This approach is as cost-effective as using a large tractor trailer for daily commuting.

Problems with the ideal

These are operational in nature and fall into four major categories — application development, production migration, change control and performance.

Application development: Application development normally goes through several phases, which may be generically identified as feasibility, general design, detailed design (programming), unit testing and system testing. A vital ingredient in this process is the availability of test data. In the traditional nonsharing environment, the process is relatively straightforward. Test data is generated from scratch or extracted from existing files. The criteria for test data generation can be simple or complex, depending upon application requirements. The stability of test data can be important to the development effort. All these factors are controlled effectively and easily in a nonsharing environment.

On the other hand, when data is shared ideally an unlimited number of applications must use common test data, which may be changed in unpredictable ways. This situation lengthens development time, thus aggravating the application backlog.

Production migration: Applications are individually moved into production, whether data is shared or not. There are widely accepted procedures for doing this in a nonsharing environment. These procedures are usually based on moving programs and data between libraries. With shared data, it is possible that one application wants to establish pointers or otherwise change the contents of a record that is used by an existing application already in production. This situation, although unavoidable to some extent, soon gets out of hand in the ideal data-sharing environment.

Change control: It is a fact of life that the needs of the business and application will change continually. Establishing priorities and schedules for these changes can be an impossible challenge to the best data base administrator if data sharing is not carefully planned and controlled.

The worst scenario is cascading of these changes or the domino effect, where one change implies another and so on. This effect will bring all data base operations to a standstill.

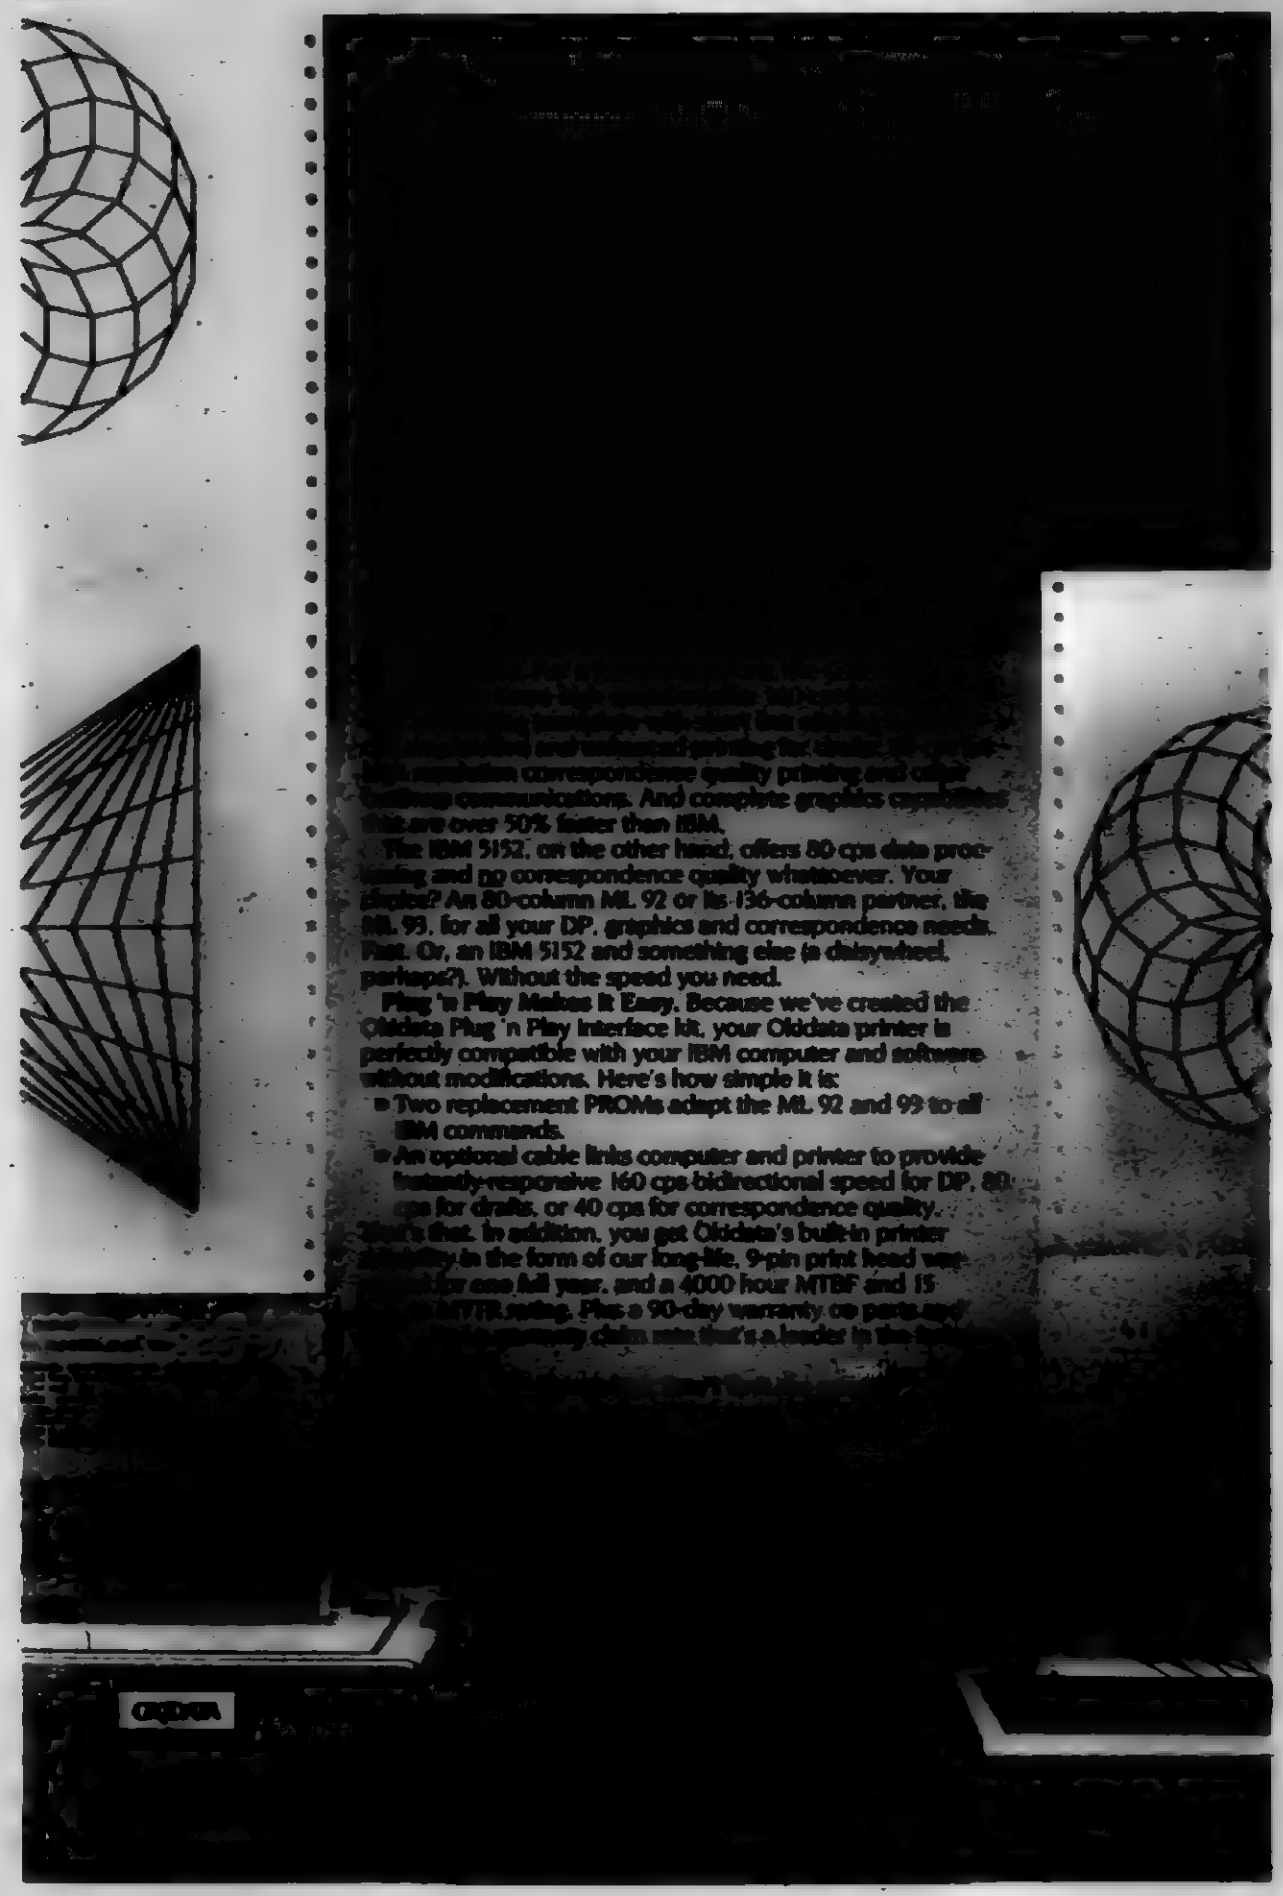
Performance: By far the greatest performance killer is the high number of I/O requests demanded by transactions. An offshoot of this is the record contention, where several users attempt to obtain a bottleneck record, which may not be technically deadlocked for the DBMS software to detect. Since the ideal data-sharing environment does not allow any data redundancy at all (other than certain primary keys), both these conditions can occur and degrade performance rapidly.

A familiar situation is that data frequently needed on-line by a new application may be buried several layers down a chain or may be scattered all over the existing production data base structure. Both contribute to excessive I/Os. Further, with widely scattered data, there is a good probability of running into record contention.

Effective data sharing

There is little doubt that the future direction of the data base is relational. However, today we do not seem to have truly performance- and integrity-oriented relational DBMS capable of handling unlimited numbers of relations in third normal form.

The majority of data base professionals believe that advanced hardware such as associative memory and parallel processors will be needed to implement efficiently fully relational systems for large concurrent transaction and query processing environments (W.H. Inmon, CW, Nov. 28, 1983). On the other hand, some experts contend that there is no reason why relational DBMS, at least in theory, cannot perform as well as any nonrelational DBMS using perfectly



WHEN IT COMES TO SOLVING BUSINESS PROBLEMS, ONE COMPANY IS A MILLENNIUM AHEAD.

Although we'd all like our business problems to fit into neat little compartments, they never seem to want to go there. Take a simple general ledger variance in your New York office. For some strange reason, it connects to a large office supplies transaction in London, which really turns out to be an erroneous distribution of a capital equipment expenditure to Peoria through your accounts payable system.

A business person can only unravel such mysteries by opening his or her mind and following the trail wherever it leads. Using business software to help.

But is your software giving you the help you really need?

Several years ago, a team of McCormack & Dodge researchers uncovered a remarkable paradox:

Business problems don't fit into compartments. Yet even the most sophisticated software packages operate on the principle of compartmentalization. In the very same vendor product line, you find general ledger packages designed one way, accounts payable another, fixed assets yet another. In actual use, these separate designs become separate walls. Barriers to problem-solving.

Even though your mind wants to move freely from one system to another, roadblocks hold you back.

Because McCormack & Dodge researchers identified this paradox first, we are years ahead of the industry in overcoming it. Our Millennium series is designed and built, from the ground up, as a genuinely borderless product line. A true family of systems in which the whole works as smoothly as any part, making the most efficient use of all your data processing resources.

With Millennium, and only with Millennium, a business person asking a question in one system can instantly enter a correction in another, seek an answer in a third, update a fourth—and move with total freedom through the entire vast information universe.

When it comes to solving business problems, McCormack & Dodge is a Millennium ahead. Shouldn't you be too?

WHEN YOU THINK ABOUT TOMORROW, MILLENNIUM MAKES SENSE TODAY.

McCormack & Dodge

a company of The Dun & Bradstreet Corporation

McCormack and Dodge Corporation, 1225 Worcester Road, Natick, MA 01760.

traditional 370-type hardware (C.J. Date, CW, Feb. 13).

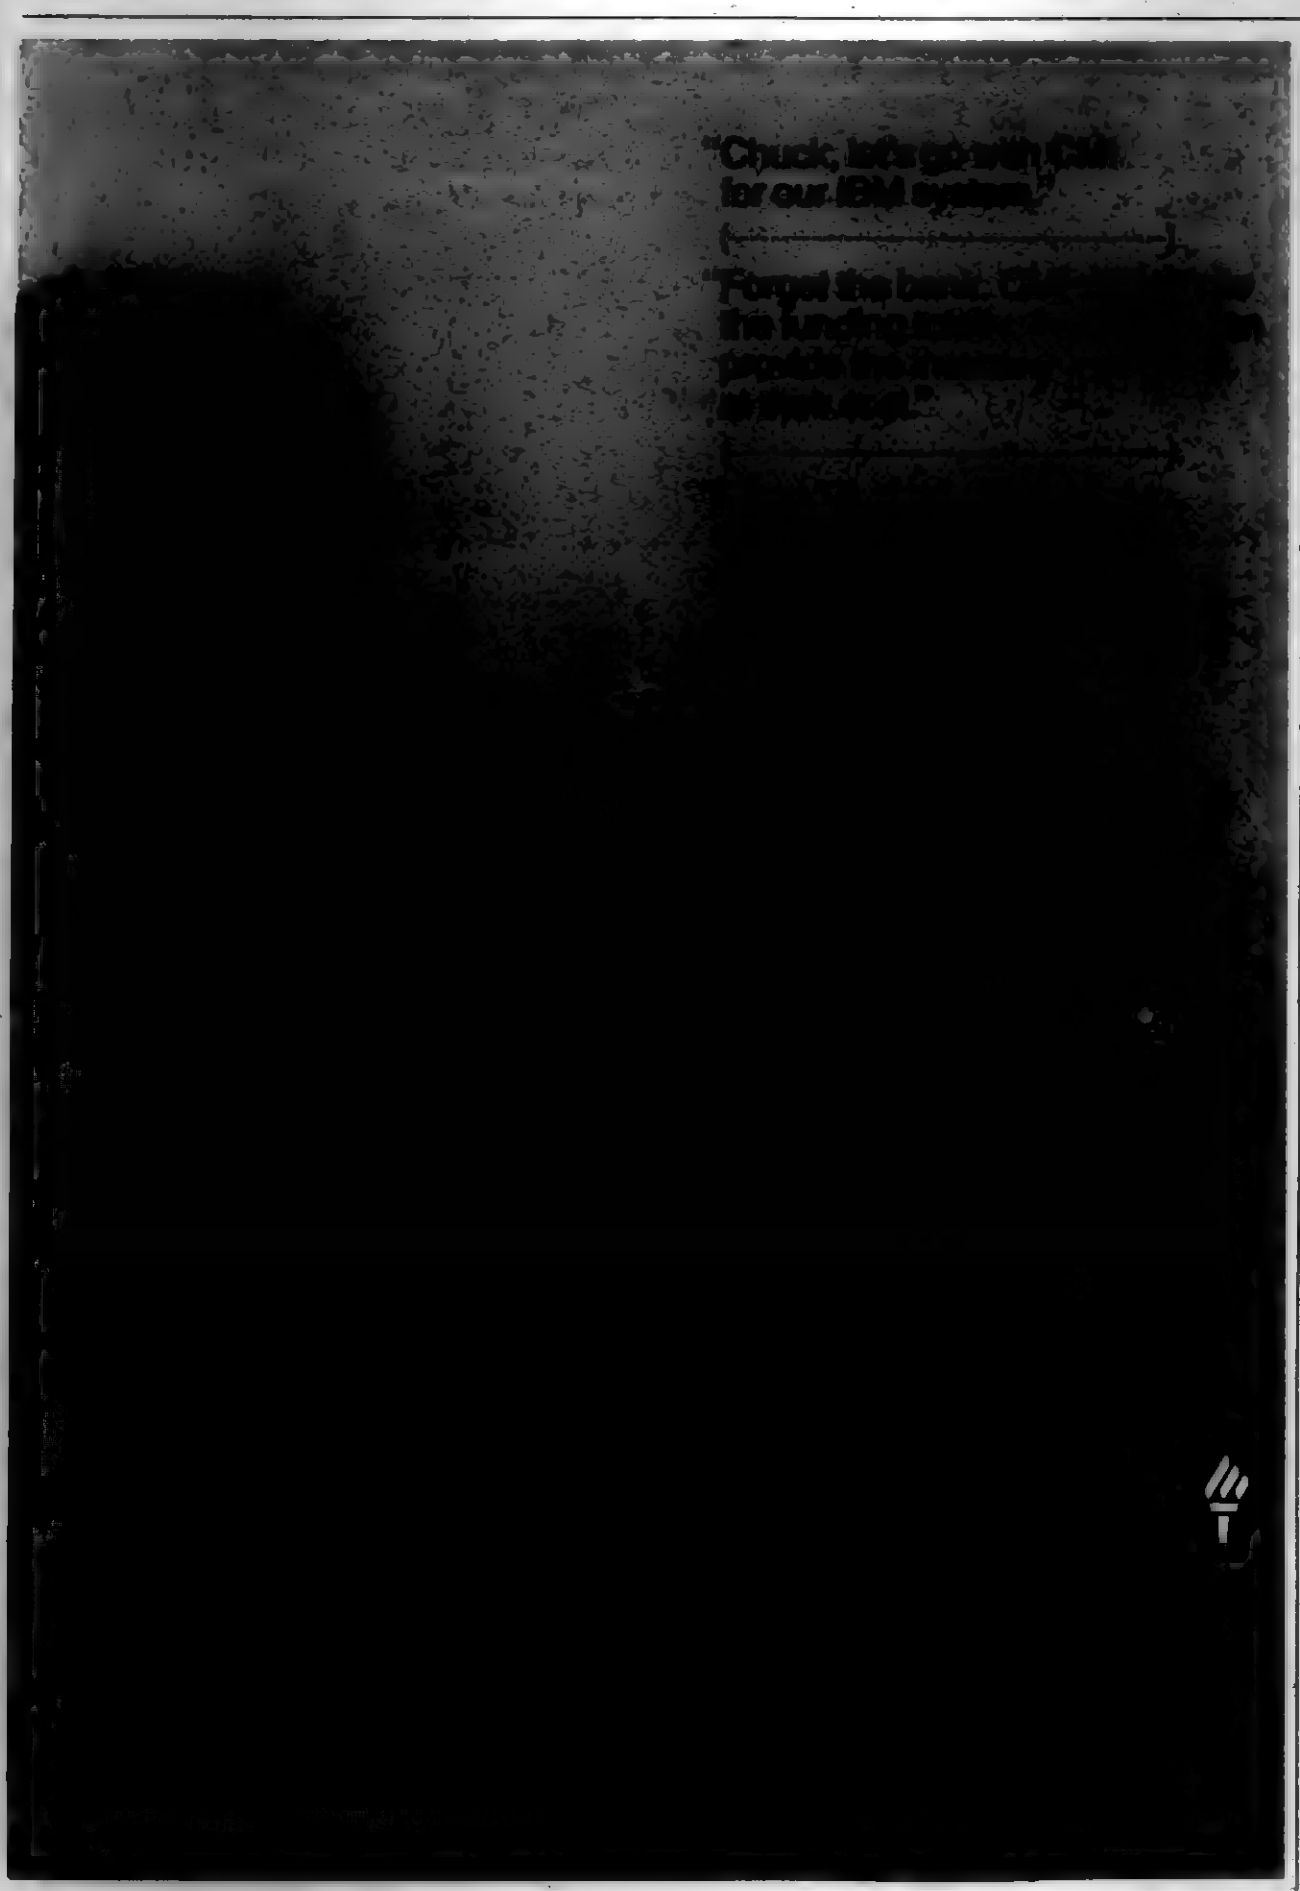
The experience of large MVS users with IBM's DB2 will settle this argument over the next five years or so, for it will take at least that amount of time for a major product to mature and win widespread acceptance. Even if DB2 proves to be as efficient as, say, IBM's IMS or Cullinet Software, Inc.'s IDMS, a number of users must continue to operate in a nonrelational environment for quite a while, since switching DBMS strategy is a monumental task, extract facilities and interfaces notwithstanding. Effective data sharing will help users reap the rewards of proven information resource management (IRM) methodologies in both relational and nonrelational environments.

Effective data sharing specifically addresses the following aspects of data sharing:

1. Sharing data definitions.
2. Criteria for sharing data.
3. Implementation.

The data definition (sometimes called "meta data") consists of the data name, a standard abbreviated name, length, storage characteristic (numeric, alpha), clear business description and special classification and notes, if any. Data definitions are centrally stored in the data dictionary managed by data administration. These definitions constitute the first step in subject data modeling and should be shared across all application systems of the company. However, because of existing systems, it is likely that there will be several versions of definition for the same data element. The number of such versions decreases as more and more functions are taken through data modeling and implementation.

The strategy of the information cycle (Figure 1) linking the end user, data definitions, data dictionary, data model, data base and applications is the key to successful data sharing. For, we cannot share something about which we know nothing, and all attempts to share data without a formal subject data model are bound to fail.



Effective data sharing will help users reap the rewards of proven information resource management (IRM) methodologies in both relational and nonrelational environments.

Business criteria

The subject data model must be studied in conjunction with business processes and functions to determine the following factors:

1. Is the business type of the new application substantially the same as the existing application(s)?
2. Are the hardware and software environments of the new application the same as those of the applications it may share data with?
3. Are security requirements of the new application parallel to those of its shareable counterpart?
4. Does the subject data model reveal any tight associations between the entities of the sharing applications?
5. Does the model indicate associations between record types of potentially large volumes?

We distinguish between two types of data sharing — passive and active. Passively shared data is updated by only one application (Figure 2). Other applications that share this data only access it. Common examples of passively shared data are pseudo entities (tables) and certain globally used data elements (name and address of employee, for example).

For instance, in Figure 2, business type 1 may represent the principal accounting functions responsible for controlling the definitions of company, department, cost center and so on, while business type 2 may represent a set of investment functions that must use the definitions.

Passive sharing is to be encouraged, because the productivity gains resulting from reduced maintenance usually outweigh the cost of its implementation. Actively shared data, on the other hand, is closely bound to two

Record volumes have a direct impact on performance and reorganization requirements. If the associated entities in the actively sharing applications have high record counts (on the order of a few hundred thousand), then logical sharing should be considered.

or more applications through DBMS pointers or program logic and usually are updated by these applications.

Active sharing involves more work for the DBA and application developers and deserves close scrutiny. The presence of active sharing indicates that the corresponding business functions are interdependent. If the business types serviced by two applications are quite different, then data sharing, if it occurs, will be passive.

The second question addresses an issue that is becoming increasingly important with the advent of microcomputers. In the simplest case, all applications that potentially share data operate in the same hardware/software environment (for example, using an IBM 308X running MVS and with 3270-type terminals). However, it may be necessary to implement part of a subject data model in another environment such as VM, mini or microcomputer because of the intended use of the data. For example, data entry and accounting functions may reside in the tighter MVS environment, while financial modeling, projection and external data may reside in the VM or micro environment. In this case, proper bridges between these environments must be built to enable transmission of necessary live data.

As a rule, all operational data should reside in the same environment. Even in this case, data may have to be distributed because of volume or processing considerations. The two known ways of distributing data are partitioning and replicating. Strictly partitioned data can be physically shared, while replicated data is only logically shared and involves interfacing procedures to maintain synchronization. A combination of the two types is typical, with predominance of one or the other. Today's large-scale distributed data strategies rarely involve concurrent updates, but use store and forward instead. Whether data is partitioned or replicated, it introduces additional considerations in data sharing. For instance, if applications in widely scattered geographical locations want to share data, it may have to be replicated because of communications costs.

Security requirements of applications with potential for data sharing must be carefully analyzed. It is possible for the sharing applications to have opposing security requirements. In this case, the more stringent requirements should be applied to shared data. The DBMS or other software must be capable of providing the desired degree of security at a record or even data item level.

The degree of sharing between two applications is indicated by the association between their entities in the subject data model. The more such associations, the higher the degree of sharing. Currency requirements of the sharing entities are important. If entity B of application 1 is associated with entity C of application 2, then we should determine how current C expects B to be and vice versa. If the currency required is instantaneous, both applications must actively share data. If one entity can lag behind the other by a day or so, then data may or may not be actively shared, depending on other constraints.

The last but extremely important consideration is the record volumes, because they have a direct impact on performance and reorganization requirements. If associated entities in the actively sharing applications have high record counts (on the order of a few hundred thousand), logical sharing should be considered.

Implementing effective sharing

The key to effective data sharing is planned and controlled data

Recommends The Diablo 630 Series

David Jamison Carlyle recommends the Diablo 630 Series.

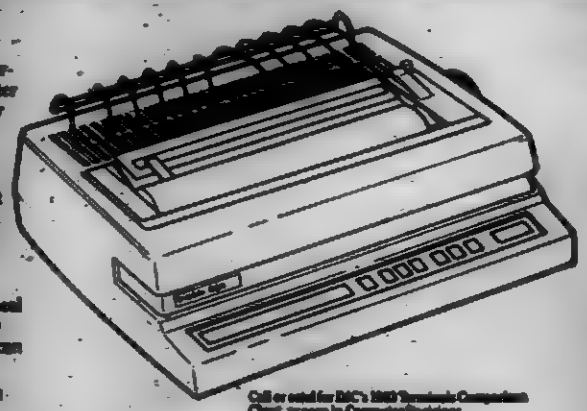
The most versatile line of daisy wheel printers for serious business applications.

630 API—The API's unique all purpose interface makes this 40 cps printer compatible with almost any computer you can name.

630 ECS—All the features of the 630 API plus the ability to print 192 fully formed characters and construct hundreds more. Perfect for scientific, financial, legal and other applications where special symbols and text are needed.

630 ECS/IBM—The only daisy wheel on the market that can truly print any character or symbol that the IBM PC can display.

Diablo from DJC, the first name in peripheral distribution.



Call or send for DJC's 1983 Terminals Comparison Chart, in use in Computer Decisions.

If data is shared between two or more applications, end users from different departments may have to participate in extensive system testing. Management commitment and a relatively high level for the data base administrator in the organizational hierarchy are necessary to bring about this cooperation between user departments.

redundancy. The first step is to construct the subject data model, which reveals the associations between the entities. This model may already exist, since by definition it encompasses more than one application. Data administration and the data base administrator carefully evaluate this model for potential sharing. The ideal answers for effective data sharing are "yes" to the first four questions and "no" to the last question.

Real-life applications, however, rarely lend themselves to such clear-cut answers. Each criterion must instead be treated as a topic for analysis, and a weighted answer must be arrived at. For example, the term "high volume" may have different connotations for different applications, depending upon their operating environments and expectations. Data sharing is decided upon when data administration and the data base administrator are reasonably sure that the issues raised can be effectively managed. In other words, data sharing is a deliberate and planned process and does not happen by default.

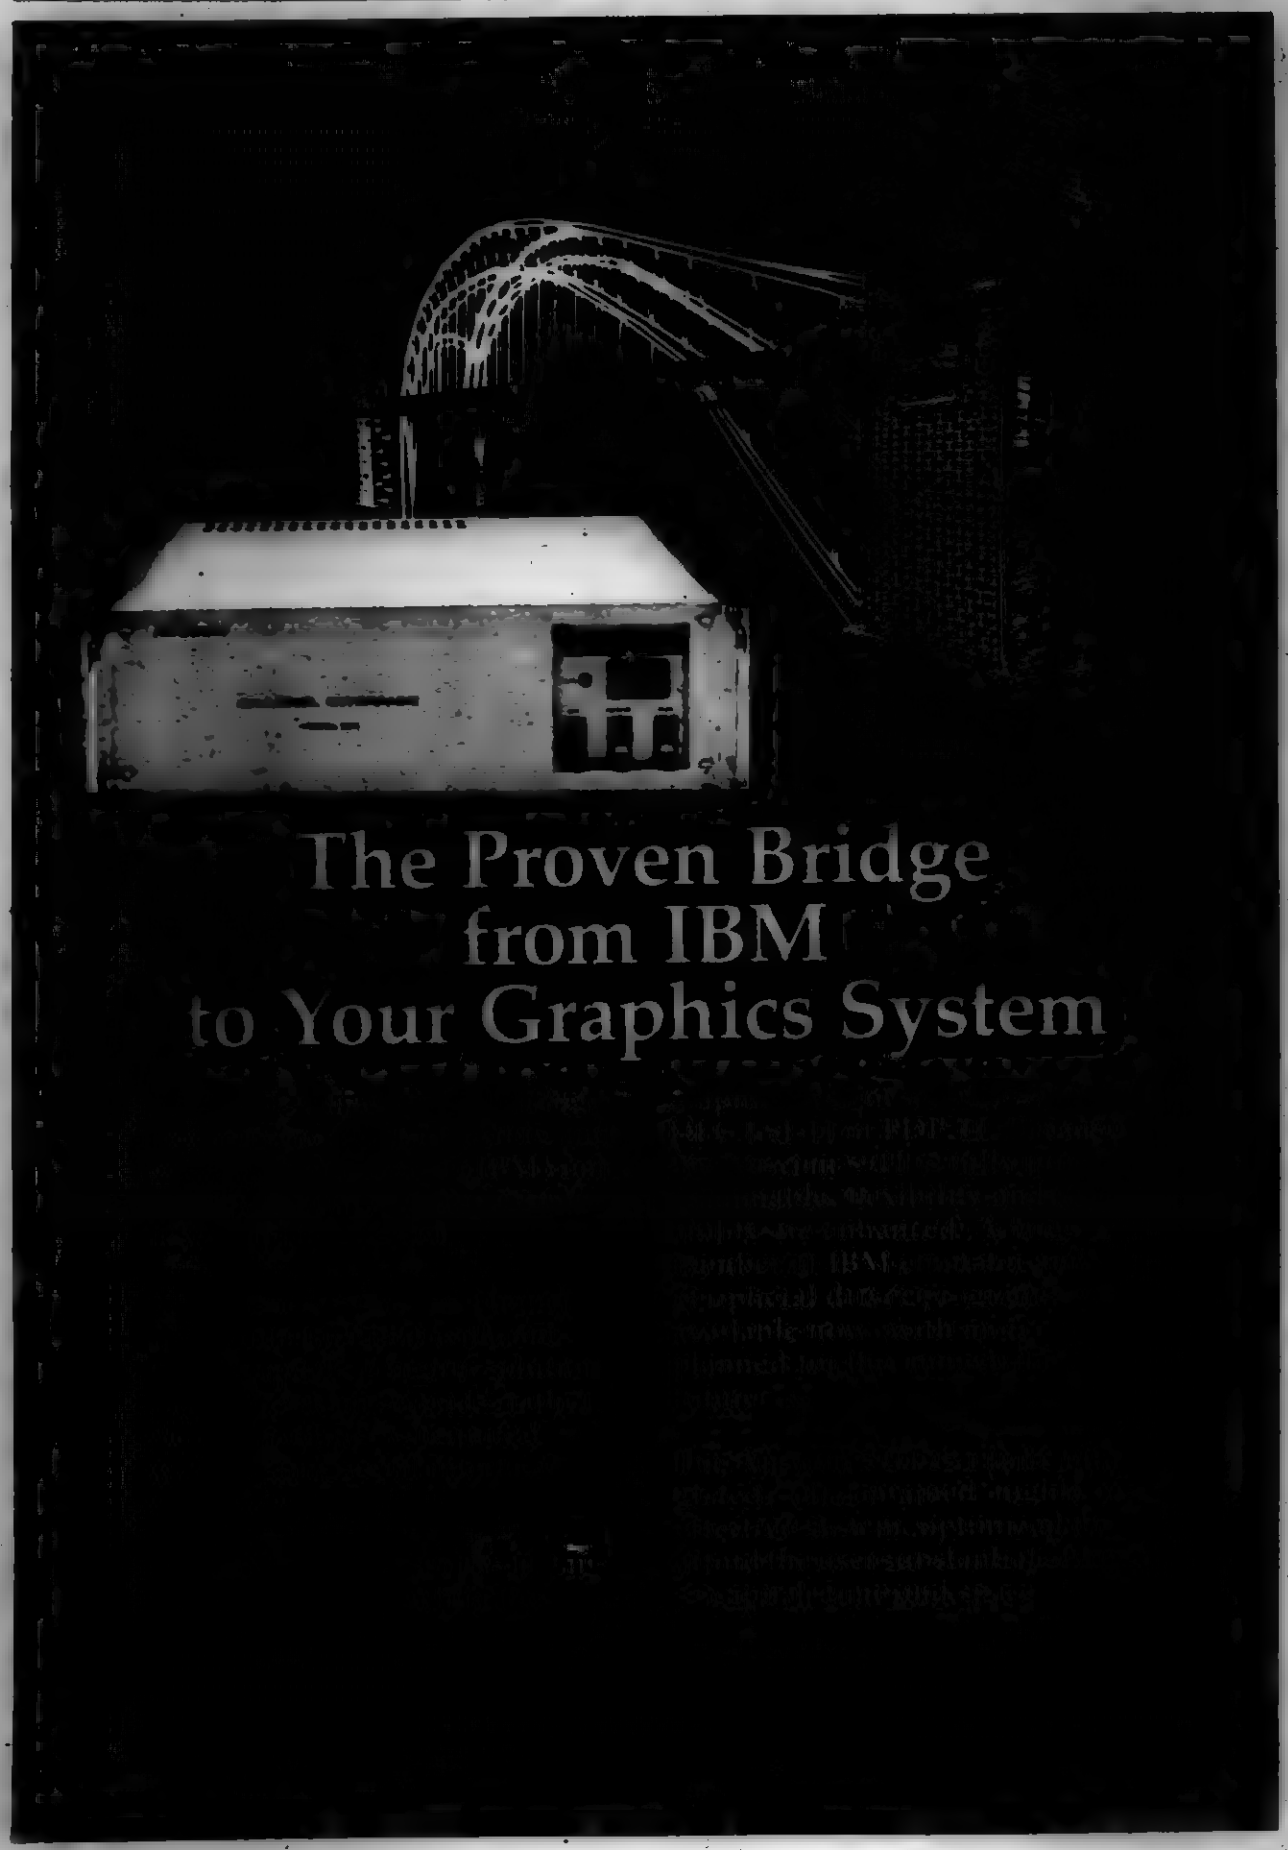
The type of sharing to be implemented, passive or active, is to be determined now. The simplest kind of passive sharing is "look-up processing," which involves periodically accessing data from another application. Essentially, these are table searches, and the applications can be truly integrated with a minimum of effort.

To implement active sharing, there are two techniques. If the volumes of the participating records are not excessive, a direct pointer relationship can be established. Otherwise, the key of the higher level record can be made into a secondary access path to the lower level record. This indeed makes the sharing logical rather than physical. Logical sharing involves program logic to keep data in synchronization. In either case, choice of physical areas, data set groups and the like must be reevaluated for ease of reorganization.

In a shared environment, the test data must be maintained centrally for those applications that follow the information cycle. While the data base administrator cannot be expected to do data entry, he may use utilities to generate adequate test data. Another data-sharing-related issue is the final system testing.

If data is shared between two or more applications, end users from different departments may have to participate in extensive system testing. Management commitment and a relatively high level for the data base administrator in the organizational hierarchy are necessary to bring about this cooperation between user departments. The price for not implementing such joint testing can be high.

Once data sharing is implemented, it is important to follow the direction of the arrow in the information cycle (Figure 1) to carry out any change control procedures. This will ensure that the original plan for the shared data continues to be effective.



About the author

V. Venkatakrishnan is data administrator in the Financial Division of Aetna Life & Casualty in Hartford, Conn. His responsibilities include building logical data models to satisfy a variety of business needs, integrating logical and physical design in a multiple DBMS environment and providing data dictionary and application development support.

SPECIAL REPORT

The next step

Manufacturing systems

March 26, 1984

COMPUTERWORLD
THE NEWSWEEKLY FOR THE COMPUTER COMMUNITY

Economic forces rock industry's foundation

Management must master technology-driven production systems

By A. J. Priscia
Special to CW

It is called everything from the "New Industrial Revolution" to the "Next American Frontier." Whatever the label, the fact is that the economic forces of global competition and dwindling productivity are driving industry to alter its basic structural foundation.

In basic as well as high-technology industries, management is being pressured to breathe new life into the corporation by developing manufacturing expertise. The result, for well-run companies, will be a completely new business orientation. Growth will stem from mastering the management of technology-driven production systems, which include information processing systems, factory floor hardware and software and labor.

Several developments will result as these systems evolve:

■ Manufacturing automation markets will grow significantly as industries invest heavily through the remainder of this decade.

■ Effective information management will become the most critical concern of the evolving corporation.

■ To meet this information management requirement, all automation activity will be coordinated and, ultimately, integrated. There will also be a merging of traditional DP, engineering and manufacturing functions.

Before discussing the factory automation marketplace, it is important to discuss the management foundation required for effective implementation.

A new breed of management is evolving, and the use of automation is playing a key role in this transition. Automation itself, however, has little to do with the problem that industry is addressing. In discussions of factory automation, lack of technology is commonly and incorrectly referred to as the preeminent problem.

The real problem is a loss of competitive advantage in the marketplace, which is caused by management's inadequate response to the changing environment, not by a lack of automation.

In the automobile industry, for example, Japan did not gain its advantage through the use of automation. The fact is that Japanese automobile factories do not have more automation in place than competing American facilities, yet they have outperformed American manufacturers in virtually every productivity- and quality-related category. These gains are attributable to superior management techniques, not automation.

Automation is a tool, nothing more, and, as with all tools, will perform only as adeptly as the craftsman using it. For well-run companies, automation represents an opportunity. If used effectively, it will lead to improvements in productivity, efficiency and quality. If it is seen as a substitute for good management, however, then its use will actually prove to be more harmful than worthwhile. If a poorly managed firm does not deal with its basic management problems before bringing in advanced technology, it will only intensify its woes.

International Data Corp. has estimated 23% to 25% compound annual growth for the overall manufacturing automation market during this decade (see chart above). These technologies are segmented into four major market areas:

■ Computer-aided design and manufacturing (CAD/CAM) systems: product design and engineering applications.

■ Manufacturing information systems: applications related to the planning, control and overall coordination of the manufacturing process (MRP II, data base management systems, decision support systems).

■ Industrial control systems: hardware and software dedicated to the control and monitoring of factory floor activity (programmable controllers, numeric control, process control).

■ Flexible production systems: programmable automation dedicated to the actual production process (robots, automated handling and inspection).

The market-segment growth shown in the above chart, beyond revealing the automation vendor's opportunity, accentuates the needs of the user community. The lion's share of each pie chart is represented by products within the CAD/CAM and manufacturing information systems segments — essentially the engineering, planning and control components of the manufacturing environment (from 59% of the total market in 1983 to 80% in 1990).

This is not to say that the markets for factory floor flexible production systems do not represent areas of opportunity, but rather that the focus of management restructuring and reorganization will have to take place at the top end of manufacturing. In other words, the bulk of manufacturing automation is and will continue to be software that is employed by the management and professional sector.

Installation is easy part

Tackling the technology implementation problem will not center on the implementation of hard automation on the shop floor. In fact, once needs have been determined and the proper management control functions have been set in place, installing the hardware is the easy part.

The question for firms considering automation should not be, "How many robots should I buy?" or "How do I implement a local-area network in a heavy industrial environment?" These questions will ultimately require an answer, but if a company has not first addressed the No. 1 question, "How will I address the information management problems inherent in using automation?" then it is not thinking in the right direction.

Building information-based manufacturing systems should be similar to building MIS organizations. For this reason, DP's involvement may prove critical to the ultimate success of this effort (building data base management systems, planning for software integration).

Product design engineering and manufacturing engineering groups, often isolated from one another, must begin to coordinate their activities. Essentially, before an integrated corporate system can work, all automation groups must be tied together, physically as well as conceptually. And as difficult as these tasks may seem, meeting the challenge is critical to success in an increasingly competitive global marketplace.

Priscia is program manager of the Computer Integrated Manufacturing Service for International Data, a market research firm based in Framingham, Mass.

Automation turns gears of turbine assembly

By Mark Anderson
Special to CW

WINSTON-SALEM, N.C. — From the management information systems used to track parts, tools and raw materials, to computer-controlled machine tools and robots, a plantwide system of computers assists in the everyday operation of Westinghouse Electric Corp.'s plant here.

The Winston-Salem plant is responsible for the manufacture of turbine components used in large steam turbines for power generation. These turbines range in capacity from 100 megawatts to over 1,200 megawatts. After the individual components are made at this plant, they are sent to other Westinghouse plants for assembly.

Among the turbine components made in North Carolina are fixed vanes, rotating blades, nuts, studs and other assorted bolting products, gear components and subassemblies and valving products, among others. Parts for new power plant sites as well as for service work at existing generating stations are made here. In addition to these traditional steam turbine components, the Winston-Salem plant has been involved in several other areas, such as general machining on a job shop basis, utilizing some of the special machine tools already in existence at Westinghouse. This plant is also involved in the manufacture of subassemblies for robots marketed by Westinghouse Unimation, a manufacturer of robotic systems.

The coordination of all of these manufacturing and assembly efforts would not be possible without computer assistance in several areas.

To understand the computer operations of the Winston-Salem plant, one must begin with the computer terminals used. Westinghouse has standardized one generic terminal style, utilizing the Ansi 3.64 protocol for all applications. This is a key concept.

When combined with a centralized integrated voice/data phone system from Rolm Corp., a user at any of these terminals is able to establish a connection with over 50 different computer systems located both in the plant and at other sites. These systems include an IBM 4341 Model Group II and a Sperry Corp. 1100/808 located inside the plant, and IBM 3031, 3032 and 3084 mainframes located at the Energy Systems Computing Center in Pittsburgh, Pa.

A Control Data Corp. 7600 and a Cray Research, Inc. Cray 1 in the Pittsburgh computing center are available for engineering use by the Winston-Salem plant. Additionally, Digital Equipment Corp. VAX systems are located at Carnegie-Mellon University in Pittsburgh, with which the plant is conducting several research activities.

The IBM 4341 Model Group II performs all of the traditional data processing applications at the Winston-Salem plant. A full inventory system, a purchasing system, accounting functions and a homegrown material requirements planning (MRP) system are all operated on this machine.

Acting as a peripheral to the IBM 4341 is a Data Pathing, Inc. Model 4122 system for factory data collection. Employees use time and attendance stations located throughout the factory to gather information on every operation in the plant. These time statistics are recorded and fed back to the 4341, where they are data-reduced and stored in a data base. This data can then be used in the calculation of costing rates, inventory tracking and work-in-process monitoring.

Additional CRT terminals located in the on-floor supervisors' offices are used by hourly workers and supervisors to monitor job progress. Using the various programs that access the data bases, the supervisors can determine the work load on each of the machine tools in their areas and then determine the next task to be performed. In addition, supervisors are able to monitor their groups' productivity and approve time-clock figures for their employees.

The second mainframe located at the Winston-Salem site is a Sperry Corp. 1100/808 system. The same generic terminals used to access the IBM are capable of accessing the Sperry computer. This system is dedicated to the support of manufacturing operations.

Using Mapper software from Sperry, Westinghouse employees are able to access several data bases containing information on machine tools, operation times, production schedules, cutting-tool designs and parts geometry.

The numerical control programming department remains the major user of the Sperry 1100. The Winston-Salem manufacturing plant contains 60 numerically controlled machine tools. Each of these machines requires a numerical control program to guide the cutting tool through the complex motions needed to manufacture a turbine blade.

Error-free programs

Parts design data bases, exchanged between the manufacturing plant's Sperry 1100 and the engineering department's CDC Cyber 845 computer, enable the parts programmers to complete large numbers of error-free numerical control programs. Further assistance to these programmers is available on the plant's Computervision Corp. Cadds 4 computer-aided drafting system.

Parts design data can be communicated from the Sperry mainframe to the Computervision system to allow automated program generation for several different types of gauges used for quality control. Here, the parts dimensions are used to create a tool-design drawing automatically. The tool designer then adds the required manufacturing detail information and tool room instructions to create a final drawing and a numerical control parts program. Other designers use the system to provide drawings, machine setup information and geometry verification data for the numerical control programmers.

Direct numerical control is made possible with a Westinghouse-designed computer system called a machine interface unit. The units provide the required interface functions to link either the Sperry or the IBM mainframe with the numerically controlled machine tools. Each of the 60 numerically controlled machine tools located at the Winston-Salem plant is equipped with a machine interface unit to eliminate the need for the more traditional paper tape.

To guarantee that parts will meet all of the customer's requirements, a number of quality control devices are employed, including two DEC PDP-11-controlled coordinate measuring machines. The Pantoscribe system feeds its data points through a PDP-11/23 to a VAX-11/750 for further analysis and reporting. A DEA system uses a PDP-11/34 for measurement verification and communicates directly with the Sperry 1100 for coordinate data transfer.

The systems at Westinghouse are used for everything from typical data processing to CAD/CAM applications. Computers have been integrated into an ever-increasing number of machine tools in the form of numerical controls and programmable controllers. The increase in productivity gained from using these computers enables manufacturing plants such as Westinghouse to make the highest quality products at the lowest possible cost.

Anderson is a data processing electronics specialist at Westinghouse in Winston-Salem, N.C.

Westinghouse steam turbine generator blades

Three I's of turbine CAD/CAM

ORLANDO, Fla. — The engineering computer services department for the Steam Turbine-Generator Division of Westinghouse Electric Corp. has adopted "three I's" as guidelines to computer-aided design and manufacturing (CAD/CAM):

- Interactive computing and graphics.
- Interfaced software and data bases.
- Integrated design-manufacturing functions.

"These are the three disciplines we concentrate on in building CAD/CAM techniques for production of the blades used in our steam turbine generator units," explained John Petras, manager of the division's engineering computer services located here.

Turbine blade design is extremely complex and requires great precision from the earliest stages to ensure efficient manufacturing and on-site operation. A single turbine generator unit has thousands of blades ranging in size from one in. to 44 in. Each row of blades varies in design to produce the required response to the incoming steam.

See BLADE 20/4

BLADE from SR/3

Other than blade geometry design, engineers must analyze steam conditions, vibration phenomena, the relationship between many different blades and the balance factor when blades are inserted on the rotating disk. Contending with all these variables makes simulations an important part of the design task, Petras noted. A broad range of simulation programs was needed to ensure that the designs will result in parts and assemblies that will perform safely and efficiently, he said.

The Steam Turbine-Generator Division initiated its CAD/CAM activities about four years ago. Since then, it has installed Control Data Corp.'s Integrated Computer-Aided Engineering and Manufacturing (Icem) system as the cornerstone for its CAD/CAM activities. The application program operates on a Control Data Corp. Cyber 845 mainframe in Monroeville, Pa.

By using a shared data base, Westinghouse facilities in East Pittsburgh and Lester, Pa., Orlando, Fla., and Winston-Salem, N.C., can access and work on the same up-to-the-minute engineering drawings. Data base development is a primary concern as the Turbine-Generator Division moves into integrated design and manufacturing.

Volumes of data

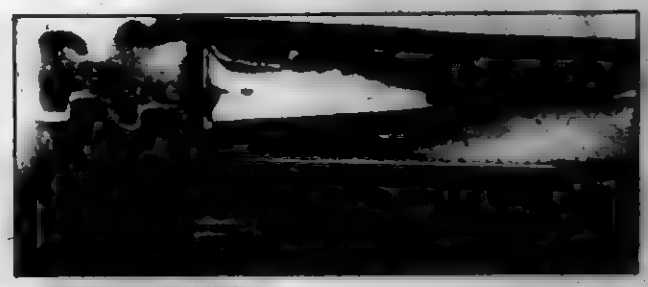
"Over the years, we accumulated volumes of engineering data that were scattered throughout the engineering department. It is important to have one central data base and to eliminate redundant data, which is expensive to store, and to make sure that design engineers have access to the best possible information," Petras said.

To achieve data base quality, Westinghouse applied CDC's information analysis methodology to formulate the data base approach. This procedure involved precise input from all users concerning the meaning of the information in the data base. A model of the proposed data base was run on the computer to determine if all user needs would be met with the proposed structure and content.

As a result, the engineering computer services department was able to demonstrate to potential users exactly what the data base would provide before additional dollars were spent on development.

With the data base structure and content in hand, Westinghouse then used CDC's DMS-170, a data management system with a modular structure and data independence, to handle the many updates and changes that characterize an engineering design environment.

The next major project for engineering computer services was to integrate the engineering and graphics data base through another system provided by CDC — the Engineering Data Library. This program allows parts geometry and other engineering data to be stored in a single data base.



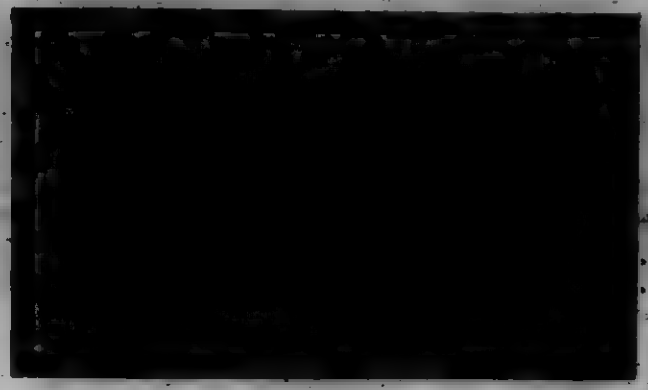
Individual turbine blades.

This capability allows engineers, manufacturing personnel, managers and administrators to access data in a common file, Petras said. "Information will be retrieved, added and deleted interactively or in batch mode," he said. "We also will get statistical and accounting data."

The wide selection of engineering software developed by Westinghouse over the years for batch processing of design data continues to be used in the CAD/CAM environment. Those programs have been made compatible with Icem, thus enabling Westinghouse to protect its software investment.

SIX REASONS WHY CINCOM'S MRPS IS THE SUPERIOR SOFTWARE SOLUTION TO YOUR MANUFACTURING CONTROL PROBLEMS.

SPECIAL REPORT



Computers link robot teams

WINSTON-SALEM, N.C. — Westinghouse Electric Corp. uses computers on the shop floor of its turbine components plant here to tie together several different machine tools, creating a team of machines from the individual units.

One such manufacturing cell has been in operation for over two years. The diaphragm blade cell links two standard machine tools to a Westinghouse Unimation Model 2000 robot. The raw material used in this process is a special preshaped bar stock. The robot accepts incoming pieces from an inclined plane and passes them to the first machine tool, which removes material from the sides of the turbine blade.

From there, the robot passes the parts to a slotting machine. A groove is placed on the part's end to serve as a locating point for subsequent manufacturing operations. A grinding operation is included as necessary to remove burrs caused by the milling and slotting operations. The finished parts are removed from the slotting machine by the robot and placed on the output inclined plane.

There are two other manufacturing cells currently under development at the plant here. A forging cell integrates two robots, a cropper/stamper, a rotary hearth furnace, two Computervision Corp. systems and an open die preform swaging machine.

Cylindrical billets

Cylindrical billets are located by one of the vision systems, acquired by a robot and placed in the furnace. After the billets reach a temperature of approximately 2,100 degrees Fahrenheit, the robot passes them to the swaging machine. There they are formed into a shape more suitable for the subsequent precision forging processes. The second robot accepts the preformed parts and transfers them to the cropper/stamper.

This machine first trims off the small piece of scrap metal from the part's end and then stamps a three-character batch identification code. The robot then moves the part to the final machine in the cell, the vision-based gauge. This device reconstructs a three-dimensional image of the part under study from a series of multiple views.

Coordinating the interactions of these computer-controlled machines requires yet another computer. In this manufacturing cell, a Digital Equipment Corp. VAX-11/750 is used as the host computer.

The second manufacturing cell being developed is a system for shotpeening turbine blades. The shotpeen operation is the last process before finished blades are shipped. The cell combines a robot, a computer-controlled shotpeen machine and a vision-based loading system.

Under guidance from the vision system, the robot is able to pick up randomly stacked blades from one of the standard materials-handling carts. The blades are then placed inside the shotpeen machine. Completed blades are then removed by the robot for packing. The host computer for this cell will be a DEC PDP-11/23.

Churning market moves dairy to first Stratus system

LYNN, Mass. — Like any user, West Lynn Creamery wanted a computer system that it could milk for all it was worth. West Lynn was not pleased with the arrangement it had — the service bureau it used was starting to make noises about increases in its work load.

That increased work load was caused by West Lynn's growth, and Jack O'Neil, manager of information systems, saw that his company would have to make a change.

West Lynn Creamery has some 6,000 customers, about double the number it had nearly four years ago when the company bought its first computers, a pair of Nixdorf Computer Corp. Nixdorf 600s. Today, the creamery handles 120 truck routes, with about 20,000 sales transactions and 5,000 inventory transactions every working day. Losing the services of its transaction-processing computer for even 10 minutes would be "a disaster," O'Neil said.

Femcon Associates, Inc. of Westford, Mass., helped West Lynn ease its way into computerization four years ago by developing a system for the Nixdorf machines that printed load sheets for each truck route. "That was just a step to get us off writing manual load sheets; it was an interim step," O'Neil said. "Our long-range plans were to get delivery tickets printed for each individual customer and to balance out drivers as they came in off their routes. That took a year and a half."

For the better part of that year and a half, the company continued to send magnetic tape to a service bureau to create bills. Meanwhile, the company's customer base was growing at a rapid rate. "By the time we were live with this system, we had already outgrown it, so we decided to go out and see what else was available. We needed a faster, more reliable system," O'Neil said.

Work load too heavy

Around this time, the service bureau began sending signals that the company's work load was becoming more than the bureau could handle. "Our first inclination was to go for a used IBM mainframe like the one the service bureau used so there would be no conversion problem, but we were kind of taken aback by the price," O'Neil said.

Together, West Lynn and Femcon evaluated computers made by Prime Computer, Inc.; Data General Corp.; IBM; Sperry Corp.; Tandem Computers, Inc.; and Stratus Computer, Inc.

In February 1982, Stratus Computer was a start-up company just emerging from its research and development cocoon with a hardware-based approach to fault tolerance. West Lynn bought the first system that Stratus sold.

The clincher for West Lynn was the fact that Stratus offered fault tolerance and "did everything with hardware," O'Neil said.

Stratus puts two complete processor boards in a cabinet roughly 2 ft wide by 4 ft high. There are also two boards for controlling memory, two for disks and two for communications between computers. Each board includes comparative circuitry that detects errors and takes the board out of service when they occur. Operation of the system continues on the board's twin.

If a board fails, the computer automatically dials the telephone number of the Stratus Customer Assistance Center in Natick, Mass. There, another Stratus computer takes the call and displays on a terminal screen the serial number and location of the failed board and a diagnosis of the problem. Stratus then ships out a new board via overnight courier.

Materials tracking speeds Apple's production

Repetitive process manufacturing facility dedicated to Macintosh

FREMONT, Calif. — To meet the anticipated demand for its new Macintosh computer, Apple Computer, Inc. is producing the microcomputer here in a repetitive process manufacturing (RPM) facility.

The facility is dedicated exclusively to Macintosh production. It was designed around the concepts of zero inventory and just-in-time materials management, in which Sunnyvale, Calif.-based NCA Corp's. Maxcim manufacturing and financial software system plays a pivotal role.

In February 1983, Apple — a longtime Maxcim user — asked The Systems Practice, a Campbell, Calif.-based consulting firm specializing in Maxcim applications, to develop the materials tracking system that Apple would use in the new Macintosh production facility.

The system would be able to calculate materials usage and replenishment requirements by workstation and shift; to identify potential materials shortage by comparing the calculated requirements against stock balances; and to monitor overall production by workstation and line, measuring actual production against plan by shift.

The materials management system would interface, through a transaction file, with Litton Industries, Inc.'s Unit Handling System. The Litton system would provide the plant's automated materials-handling capability. Additionally, for other Apple plants not using the Litton system, facilities would be provided for entering transaction data manually.

Inspection of material

The Macintosh manufacturing process starts with the inspection of incoming material. The material is detrashed (all packing material is removed), then allocated to one of several storage media for subsequent delivery to work centers on the production floor.

Overhead hangers on moving tracks carry the larger components to the operations center where they are used. Smaller components are stored in totes; these, in turn, are stored in a multistory tote stacker. As material is required on the floor, cranes retrieve it, placing the appropriate totes on automated guided vehicles. The vehicles deliver each tote to its proper operations center.

Other material is delivered directly from incoming inspection to its appropriate consuming work centers, via automated guide vehicles, while still on the original pallet delivered by the vendor.

Apple has automated the burn-in operation for the Macintosh. Burn-in racks move along conveyers capable of handling 85 units at a time. There are seven levels of conveyers in each of the four burn-in lines, which give the plant a capacity of more than 2,000 computers per day.

Each Macintosh runs its own diagnostics during the 24-hour burn-in period and stores the test results on the micro-floppy disk used by the machine. Post-burn-in inspection is then simply a matter of evaluating the results displayed on each unit's video screen, checking the brightness of the screen display and examining the unit for physical defects. The total inspection time is 23 seconds.

Computers passing inspection are scanned — serialization tracking begins when a unit's covers go on — and two bar-coded labels are printed. These carry the unit's encoded serial number. One label is applied to the shipping container, which is palletized and shrink-wrapped. The other label is applied to the pallet's shipping manifest, which is taped to the finished pallet. The pallets are then delivered — again, via automated guide vehicles — to the shipping area for delivery to Apple's distribution centers.

One of Apple's stated design goals for the materials management system was that it integrate with the company's existing standard Maxcim functionality.

Thus, the system, as developed, uses file elements from Maxcim's bills of material, general ledger, inventory, shop routing, work order status, manufacturing cost, requirements planning and data base management system modules. The Systems Practice also created 16 new files, 16 new programs and other report programs specifically for the RPM environment.

The RPM materials tracking system requires that the user, by means of Maxcim's shop routing module, define each line on which repetitive operations are to be performed. Likewise, each component on the bill of material for the item being produced must be identified with the deliver-to-operation sequence number in which it will be used.

Using this data together with pe-

How to load your 38 for maximum MRP performance

Not many System/38 users know how. Perhaps you already found that out by using another system. If this is your first time, check out the features that are important to you. Our users enjoy the benefits of a closed-loop MRP II system that allows direct access for anyone to all the information stored. We have a query facility that lets you generate user reports. And we utilize an advanced data base architecture which increases programmer productivity, making changes needed for expansion simple and economical. We even have a PC link which lets you transfer information to your IBM Personal Computer for interaction with popular planning micro products such as 1-2-3® from Lotus.®

Loaded with RMS/38 the potent IBM System/38 can make your business hum with the precision these economic times demand. Loaded with anything else you may have to settle for second best. In the fiercely competitive arena for manufacturing management efficiency, where survival depends on increased productivity — and profits — the software system you use can spell the difference between satisfaction or frustration, maybe even success or failure.

Only RMS/38 has 15 powerful applications to provide you with all the ammunition you'll ever need for total control. Control not only of manufacturing but all those vital support functions as well, including distribution and finance. Total software . . . RMS/38!

Reduce inventory; eliminate parts shortages; acquire time for skillful buying; schedule production based on demand, not parts availability; determine whether to buy or build needed components; improve part number, inventory and routing accuracy; and order in time for delivery on time. You can with RMS/38.

If your present MRP system, whether manual or automated, represents something less than a total integration of business and manufacturing systems; if it doesn't offer the distribution and financial support of closed-loop MRP II; if it doesn't offer you control in an unpredictable environment; then maybe it's time you investigated the building block software of RMS/38.

For a free demonstration or more information, contact PCR, Professional Computer Resources, 2021 Midwest Road, Oak Brook, IL 60521 (near Chicago). Also in New York, San Francisco and Los Angeles.

SPECIAL **REPORT**

BOARD from SR/6

When it arrives, the customer installs the board and returns the defective one to Stratus.

At the time of the purchase, Stratus was new and unproven, so West Lynn management interviewed the company's management team and reviewed their business plan to assure themselves that Stratus would be able to stay in business and provide replacement parts and service. West Lynn then bought the Stratus/32 system, which now supports 39 terminals located throughout the company. Before Stratus, O'Neil said, the company was "teetering on the edge of not having enough capacity."

"We don't see a ceiling now," Paul McWhinnie, vice-president of Pemcon, claimed.

Making the transition from one computer system to another is usually a rocky road, but, McWhinnie said, "West Lynn doesn't have any horror stories to tell."

Fault tolerance

Since fault tolerance is handled by hardware, the programmer does not have to learn any special techniques to assure fail-safe operation. The Stratus computer supports industry-standard Cobol, McWhinnie said.

Pemcon will soon be marketing the software package it developed for West Lynn, with some modifications, under the name DIS+.

The system designers faced one particular challenge: West Lynn wanted to be able to process all special requests for unscheduled, same-day deliveries. This service was difficult to provide when it had to be done manually. Pemcon designed DIS+ to have all of the sales and inventory transactions that were generated in the order process available for reconciliation before the driver returned at the end of the day.

O'Neil is now gearing the department toward telemarketing, not just order entry. West Lynn Creamery carries about 750 products. The department has 28 terminals for telemarketing representatives and four for supervisors. Each telemarketing representative makes between 150 and 200 calls a day.

The DIS+ system was designed for use by people who have little knowledge about computers and no programming experience, according to McWhinnie.

At the terminal, a representative creates an order by entering an account number or name. The system determines the route and delivery date automatically. A secondary menu offers the operator several options for entering the order. One method allows an average order to be created from a sales history file. For customized orders, the history file is used to display the customer's average order for that day and to identify noteworthy variations in the order.

Added to load sheet

When the order is completed, the products to be delivered are added to the appropriate truck's load sheet. Delivery tickets, which are used as invoices for cash customers, are then produced in delivery sequence. The system also offers supporting programs that allow maintenance and inquiry to the customer, product, price and route sequence files, McWhinnie said.

At any time, supervisors can check on the status of a route or of individual customer orders. Symbols appear next to each customer name showing whether the order is in.

Supervisors handle routing. Regular customers are automatically assigned to their regular routes, but sometimes orders have to be moved from one route to another.

Another goal the new system achieved is the elimination of estimated orders, O'Neil said. The aim was to increase the number of stops each truck can make by decreasing the amount of discretionary stock assigned to the truck — stock which, if unsold, is returned to the creamery.

One of the most noticeable effects of the system has been at the loading dock. Before the Stratus system went into use, preparation of load sheets created a bottleneck, forcing shippers to wait around for written orders so that they could load a truck. It took at least 15 minutes to prepare a load sheet by hand; the Stratus has cut that to less than one minute.

More people in your position choose ASK.

After all the sales hype, analyses and benchmarks, the choice of a manufacturing system often comes down to a gesture of faith.

Don't make it blindly.

First consider why ASK inspires the confidence of more MIS professionals. (And why customer referral has made us the biggest in our field.)

Then consider this. Our MANMAN® software integrates manufacturing and financial operations more completely. So you'll never find yourself at a staff meeting accounting for your lack of cost accounting. Or your choice of a system.

Then consider the best part. You can fully implement MANMAN on a VAX or HP 3000 in under a year. So the information burden shifts from your shoulders sooner. And smoother. Because with our comprehensive training and documentation, your users quickly learn to help themselves to all the information they need.

Find out firsthand why more people choose ASK. Contact Carol Singh at (415) 969-4442 or 730 Distel Drive, Los Altos, California 94022. Get a customer referral. Then call and ask someone in your position about MANMAN.

What you hear will answer your every prayer.

Esprit: strategy for Europe's information age

By Chris F. Hindermann
Special to CW

In the shadow of World War II and following the founding of the European coal and steel community, the atomic energy community and the European economic community (EEC), a new form of community is being created in response to the challenges facing European society in the age of technology.

Of the new technologies, five aspects of information technology have been chosen by the EEC as of greatest importance for future European industrial competitiveness. These are computer-integrated manufacturing, microelectronics, software technology, advanced information processing and office systems. The EEC's urgent need to keep up with its competitors in these areas has persuaded governments and major information technology companies to embark on an unprecedented venture in international cooperation.

In the area of computer-integrated manufacturing, for example, the objective is to establish a technology base for the progressive introduction of information technology to all phases of the manufacturing cycle, leading ultimately to fully integrated production systems. As with all five areas of research, this will be achieved by collaborative research and development by EEC industries, software houses, research institutes and universities. This joint venture is Esprit — the European Strategic Program for Research and Development in Information Technology.

Strategic program

Esprit is a strategic program in two respects. First, it is aimed at precompetitive research. The EEC information technology industry already spends some $5 billion a year on research and development. Yet only a negligible fraction of this sum is spent on longer term, precompetitive R&D in Europe. The first five-year phase (1984-88) of the 10-year Esprit program will cost about $1.3 billion and will be financed on an equal basis by the EEC budget and by industry. The final budget was recently passed by EEC member countries. This figure will raise expenditures in precompetitive R&D to around 6% of the total EEC investment in information technology R&D, well in line with the competition.

Esprit is also strategic in that it is selective, concentrating its resources on key sectors of information technology development. The program focuses on the following five interrelated areas:

The central, enabling technologies, which are:

- Microelectronics.
- Advanced information processing.
- Software technology.

And two specific application areas:

- Office systems.
- Computer-integrated manufacturing.

The microelectronics drive of Esprit is directed strongly at the design, testing and production of very large-scale integration (VLSI) silicon chips, a crucial area of the information technology sector in which both the U.S. and Japan have established significant leads. Esprit will be concentrating on the fundamental bipolar and metal oxide semiconductor silicon technologies, as well as the computer-aided design techniques required by VLSI miniaturization.

Advanced information processing is at the forefront of Esprit's precompetitive research role, with its emphasis on the future industrial exploitation of information and knowledge engineering, storage and usage, signal processing and external interfaces. Its overall goal is to establish technological functions that will more closely resemble human thought processes, such as association and inference — artificial intelligence.

Software technology is a vital area of information technology in which Esprit can make an important contribution in both centralizing and disseminating software research results, as well as eventually overseeing a comprehensive set of engineering and formal standards and a unified framework of concepts and descriptive notations. As a first step, emphasis in the Esprit software effort is being placed on common tools, formal methods and transformations and information management.

Office information systems are expected to address the single largest market for information technology. The Esprit objectives will be to concentrate on the man-machine interface in areas such as document creation and distribution, workstations, integrated text-voice-image communications with value-added functions and knowledge storage and retrieval. EEC standardization is also likely to be an essential element in information technology applications where disparate systems are brought together.

Computer-integrated manufacturing will eventually mean the overall systematic computerization of the manufacturing process. Research will be concentrated on integrated systems architecture and general software development, machine control and the development of sensors and microelectronic subsystems.

The Esprit pilot phase has proved to be an encouraging dress rehearsal for the main program phase. Despite the relative novelty of the contract conditions and a short deadline (six weeks), the pilot phase was heavily oversubscribed. The $21 million set aside for this one-year phase (50% provided by the EEC) allowed the final selection of 38 out of 200 proposed projects. Most of these are likely to continue into the Esprit main phase after the year's end.

The pilot projects are valid in and of themselves and allow a quick start on activities in a number of key areas, such as defining standards and reviews of the state of the art. They also test the mechanisms proposed for the main program.

Partnerships embraced

Above all, the pilot projects have given encouraging evidence that partnerships among large and small companies, universities and laboratories have been willingly undertaken across national frontiers in the EEC. Esprit is not the private preserve of big business, nor is it in any way an attempt to create an information technology multinational based in Brussels.

Esprit is addressed, quite simply, to everyone in the EEC who can contribute to the program. In order to be eligible for aid, projects must be put forward by firms or research teams that are already established and are currently carrying out R&D work in EEC countries.

A primary justification of Esprit is the synergetic effect it will have. For this, adequate dissemination of information on all aspects of the research is of fundamental importance. Although Esprit is planned to run for 10 years, the information must be made available at least on an annual basis if it is to have the desired catalytic effect and if it is to shape the program for the coming year.

For the scientists directly involved, the EEC intends to organize workshops on each research topic. Meanwhile, a wider clearinghouse infrastructure is being established to collect systematically and make available appropriate information on work in progress. This will be done through annual conferences and the Information Exchange System (IES), an advanced information technology network now being set up for Esprit.

The IES initially will allow potential participants in Esprit to know what is going on under the program. Once contracts are placed, the IES will be the central network linking the various teams in the different countries. It will also be a means of disseminating the results of their work. With connections to national administrations and data banks, the IES should be an EEC-wide network that is of lasting value to the entire European research community.

The response to Esprit has been positive. Only the question mark hanging over the overall EEC budget prevented the program from being fully adopted by all the EEC governments well before the end of 1983, and calls for proposals for participa-

See page 59/10

SPECIAL REPORT

EEC from SR/9

tion in the main program are scheduled to go out as soon as possible.

Esprit is still only one strategic action in a wider context. While it is designed to encourage the necessary change of approach by the European information technology industry and to speed up the transfer of technology within the EEC, a technology push must be complemented by a greater market pull if industry is to amortize the costs of developing a new generation of information technology products.

The success of Esprit will thus be heavily dependent on EEC progress toward the adoption of European standards and the removal of national barriers to information technology trade.

New information technology will be one of the dominant sources of technological advance until the end of the century, and information technology will be one of the world's largest manufacturing sectors by 1990. The world information technology market is projected to grow at an annual rate of over 8%.

Europe has been slow to seize the industrial and market-building opportunities offered by information technology. Although the EEC represents over 30% of the world market, European industry commands scarcely 10% of that market and little more than a third of the European information technology market itself.

European information technology companies are also relatively small compared with world leaders. EEC governments have attempted to compensate for this by either protective measures or subsidization. These may have kept some companies alive, but no world competitors have emerged.

Liberalization in external trade, on the other hand, has allowed a spate of licensing agreements between European, American and Japanese firms. This may hold short-term benefits, but it cannot provide a long-term answer.

Kindermans is marketing manager for the Brussels office of Logica S.A. Logica is an international computer software, consulting and products company with U.S. headquarters in New York.

RPM from SR/7

rameter information that defines the physical production line characteristics, the materials management system generates a work-in-process stock status file. This file basically is a concatenation of Maxcim's stock status and product structure files. A file maintenance program does the concatenation; the same program also checks for engineering change notice activity and posts effectivity dates to changed components that have been defined previously.

To create the detailed final production schedule, the system uses a version of Maxcim's master schedule file. The system generates records for each operation defined on the routing, with planned quantities derived from the master schedule.

Phantom operations

Scheduled completion dates are calculated using logic similar to that found in Maxcim's work order system. Phantom operations — those that consume material but do not report completions — are permitted. The user must assign stage-completion part numbers out of each operation that is planned as a reporting operation. The materials handling system permits completions to be entered manually or derived automatically. The system also permits transfers between lines and/or generic rework centers.

A daily posting program is run at the end of each shift. The program calculates materials usage and generates materials requirements based upon actual production and the next shift's planned production. It also identifies potential shortages based on the balances posted in Maxcim's inventory module.

The Systems Practice is in the process of defining the materials management system's reporting mechanism. Also under development are graphics retrievals that will display materials usage vs. planned visibility, production run rates by line and work center, and work-in-process inventory stock status.

SPECIAL REPORT

Vision gives new perspective on automation

By T. K. Lakshmanan
Special to CW:

The sense of vision has added a new dimension to the capability of an automated machine or robot. Machines endowed with vision are now conducting inspection and measurement, assembly, bin picking and many other functions associated with manufacturing.

The process of extracting the information contained in a scene can consist of three steps: image formation, image analysis and image interpretation. In actual practice, the system needed to perform these functions generally consists of a camera, a lighting system, an image-processing section, an interface to other equipment (such as manufacturing machinery), a programming keyboard and an image monitor.

The camera most often used is a solid-state or television camera of the charge-coupled or charge-injection type. The screen may consist of an array of 256 by 256 pixels; each pixel generates an analog signal proportional to the intensity of light on the element.

Two categories

Vision systems fall into two categories, based on the number of shades of gray they can discriminate. Binary systems can only detect two shades: black and white. Gray scale systems can detect many shades of gray, for example, 64 or 256 gray tones, which respectively need one byte or two bytes of storage per pixel. Binary systems are much more developed and more widely used at this time. With binary systems, the processing speed required is relatively slow, and the algorithms used are relatively simple. Gray scale systems need considerable processing power and advanced algorithms.

There is actually a third category of vision system, one that uses light striping. This system analyzes binary images formed from objects on which stripes of light have been projected. The system is then able to estimate distances by triangulation and to delineate shapes from the distortions introduced in the light stripes.

There are three broad classes of algorithms that correspond to the three classes of vision systems. One popular approach is an algorithm developed by SRI International, Inc. Using the SRI approach, all objects are assumed to show up in one color (such as black) while the background is in the other color. These blobs are analyzed to determine characteristic features and are then compared with features previously stored in memory. As long as it has unique features, the object can be identified. Orientation and position can also be determined if the system is calibrated properly.

The basic approaches to recognition in both binary and gray-scale systems are template and feature matching. In the former approach, the system compares the image with the closest digitized representation in its data base. In the latter, design rule criteria and shape characteristics are used for identification.

A majority of present-day vision systems are used for product inspection, but increasing numbers are being used for product and component recognition as the technology advances.

The third and newest application area is robot guidance. This area is growing faster than the other two, alongside the proliferation of robots in most industry segments.

Cognex Corp. in Needham, Mass., has a system that analyses printed-circuit board traces or other lettering. The system has a 576- by 452-pixel resolution and 64 gray levels. Specially tailored software is necessary for each application. The system software looks for distinctive features rather than the general shape of the object. The proprietary algorithms enable the system to distinguish individual members of a common group of objects (for example, keys) by looking for characteristics of each member of the group.

Mathematical morphology is the technique used by Machine Vision International in Ann Arbor, Mich. This technique seeks differences among group members by eliminating common features. For example, in inspecting gears, the system would look to the spaces between the teeth for differences rather than to the teeth themselves. Parallel processing speeds up recognition.

Octek, Inc. in Bedford, Mass., has a technique for counting paper cups based on gray-scale processing. The system's computer uses an edge-detection technique to sense the cup rims.

General Electric Co. has a three-dimensional gray-scale approach for tracking welding seams. Seam-tracking is made possible by combining the characteristics of the crack with the size of the puddle forming the weld.

Eight stages of image processors and two stages of arithmetic logic units are used by a system from Digital Analog Design to recognize, in real time, a 3- by 3-pixel image having

SPECIAL REPORT

Test robot work cells with graphics systems

By E. W. Baumann
Special to CW!

As the number and complexity of robot applications increase, the importance of being able to evaluate design and programming alternatives will also increase. While such evaluation can certainly be performed on a trial-and-error basis in the real world, there are advantages to be gained by testing those ideas first in a simulated world using computer graphics. These advantages include:

- The time and materials spent on physically prototyping alternative robot work cells is reduced or eliminated.
- The need to purchase or lease many different robots in order to decide which one is best for the job is reduced or eliminated. This is true only if the simulation system can handle robots of many different manufacturers.
- The possibility of inflicting physical harm to personnel or equipment in the event of a programming error is reduced. The term "system crash," when applied to the consequences of bugs in robot programs, must be taken quite literally.

The major disadvantage of using computer simulations to develop robot applications is that simulations are never perfect representations of what will happen in the real world. The user must therefore be careful to understand which aspects of real-world behavior are important to his application and how well they are reproduced by the simulation.

Also, if only a few very simple robot applications are going to be installed and there is little doubt concerning their success, an investment in a powerful general-purpose simulation system is probably not justified.

Develop general concept

Before detailed design work can begin on a new robot application, it is first necessary to develop the general concept of the work cell that will be required. This conceptual design is useful not only as the initial step in the top-down design of the new cell, but also to help convince the customer (or the engineer's own management) of the suggested approach. It is generally easier to get the idea across by viewing the simulated cell in action rather than by reading pages of text and static drawings.

While setting up the graphics representation of the work cell to be simulated, the best positions and orientations for the robot and other devices can be determined. This device location information can then be passed to those responsible for actually constructing the cell.

Off-line programming of flexible robot work cells may eventually prove to be the most important application of graphics simulation tools. Although the complexity of present robot applications resides mainly in the complexity of manipulator motions required to complete a task, this will not always be the case.

As robots are required to perform more complex tasks in less structured environments, greater emphasis will be placed on the sensing and logical control aspects of robot programs. For now, a useful first step can be provided by a system that combines motion with the remainder of a program written in the robot's native language.

In this way, an off-line program

can be produced that will already have had the robot motion portions debugged to a large extent. In cases where robot motion accounts for practically all of the program's contents, the program should be nearly bug-free.

For an off-line program developed using a simulated cell to have any chance of working in the actual cell, it is important that the modeled cell and the actual cell agree geometrically. While they can never be made to match perfectly, convenient methods still exist for resolving a large portion of the difference once a cell has been installed.

The primary emphasis of first-generation graphics simulation systems has been on providing user-friendly methods for specifying robot motion and then accurately portraying the programmed motion. There is no doubt that additional improvements can and will be made in these areas.

As more complex robot applications appear, greater attention will be paid to simulating sensor-based robot behavior and in keeping track of accumulated position and force errors that may lead to failure.

So far, these systems have only acted as providers of relatively raw information to a human decision maker. In the not-too-distant future, systems may have the ability to analyze their own simulation results and give advice to the human user during a cell design or programming session.

Baumann is a specialist in computer-aided design and manufacturing for McDonnell Douglas Automation Co. in St. Louis, Mo.

AUTOMATION NEWS

The newspaper for flexible manufacturing and robotics, tabloid size, printed on jet paper.

New Subscriber Offer Features Reduced Rate Along With Free Gift

NEW YORK–Manufacturing management and engineers can now receive AUTOMATION NEWS at a reduced, new subscriber, rate of $19.75 along with an 80 page, factory management glossary as a gift.

This introductory offer will save you $9.25 off the regular subscription rate of $29. In addition, if you become a subscriber for a full year or more we'll ship you, hopefully on payment, a comprehensive, cross-referenced, perfect bound, factory management glossary containing over 2,000 terms in advanced manufacturing technologies covering categories from CAD/CAM to Vision, robots to CIM, and components to programmable controllers.

Every issue of AUTOMATION NEWS will inform you through objective, easy-to-read reporting, of the latest factory automation developments in CAD/CAM, computers, robots, FMS, components, lasers, programmable controllers, software, vision and sensors, reports from abroad, association news, finance (complete with stock listings and bonds ratings), people on the move, industry surveys, new/used machine coverage on a local, regional, and national basis. And, don't forget our classified section.

Combined, AUTOMATION NEWS, the Factory Management Glossary, and a reduced subscription rate make this an offer you can't refuse if you want to be in the know on advanced manufacturing technologies.

To subscribe simply fill in the coupon below and mail it to: AUTOMATION NEWS, Subscription Service Dept., P.O. Box 1961, Dover, NJ. 07801 or call Mike Ryan for faster service at 212-889-6356.

To get your glossary immediately, just add your credit card.

We accept MasterCharge and VISA.

— Yes please enter a subscription in my name and bill me at the new subscriber rate of $19.75 (35% off the regular yearly rate of $29)

— I can't wait! Enclosed please find my check for $19.75. Please enter my subscription and rush my factory management glossary.

WHEN THERE'S NO CHOOSING, CHOOSE ICOT.

More personal computers. More workstations. More remote locations.

Everyone seems to be demanding *more* of your 3270 network. And management says, "Do it—but do it for less."

It's a tough spot to be in, unless you know about ICOT's Virtual Terminal System™ protocol converters. In place in your network, they deliver the compatibility everyone wants and the economy and flexibility you need.

You can make inexpensive asynchronous terminals and printers compatible with your BSC or SNA/SDLC network. A single terminal can access multiple applications and multiple hosts. And personal computers can be included easily in your network. All without expensive software modifications.

You have the flexibility of either dial-up or leased-line communications, letting you choose the option that's least expensive for your situation. Plus the option of adding ICOT's value-enhanced 3270 lookalike terminals.

It can all be done easily. Economically. With a built-in flexibility that makes future expansion fast and simple.

And when you use ICOT's protocol converters, we back them up with our expert installation, service and engineering support.

Now you don't have to choose between expansion and economy. Just choose ICOT. To find out more about the ICOT Virtual Terminal System, call or write:

Bar code tech monitors Honeywell shop floor

DENVER — Honeywell, Inc. has installed a microcomputer-based system that uses bar code data collection technology to control work flow in the printed-circuit board area of its Test Instruments Division here.

Honeywell manufactures medical diagnostic and test instruments at the plant and produces virtually all of the necessary subassemblies on-site. The circuit card area services all of the different equipment model lines, as well as Honeywell's Field Service Department.

Consequently, there are several hundred different types of circuit boards produced in quantities that range from a single unit to several hundred. The circuit card area has production facilities to stuff, solder, test and repair the boards. Additionally, there is an inventory area that maintains a stock of parts specifically for the circuit card area.

What was really needed was timely information directly from the shop floor — the source for information about material usage, job status, personnel utilization and work flow efficiency. The problem was that information about these factors was difficult to obtain expediently and accurately.

The work flow in the circuit card area is arranged in a series of assembly lines with a central work-in-process inventory carousel. Each job is issued under a work order that contains a routing sheet and a parts list. Since there are over 500 different types of assemblies that are built in this area, it is very probable that as many as 25 different types of circuit board are being worked on simultaneously by the workers on the floor.

The circuit card area had several significant problems:

- Production scheduling was based on information maintained in a plantwide manufacturing resource planning (MRP) system that was updated infrequently. Consequently, the work load of the area fluctuated widely, and due dates were often missed.
- Material was tracked by following paper routing sheets through the production process. These sheets were frequently lost or had erroneous information. Inquiries about the status of specific jobs could be answered accurately only by physically locating the job on the production floor — a time-consuming job for the circuit card area scheduler.
- Personnel time utilization was tracked with time cards that were filled out daily by each employee. This system made accurate cost allocation difficult because direct production time was often logged incorrectly. In addition, information from over 100 employees had to be entered into the MRP system manually — another source for errors.
- Production was often interrupted because of parts shortages. This was due principally to the fact that the production planners would schedule jobs based on inaccurate stock-level information obtained from the MRP system.

Study group organized

Honeywell organized a study group consisting of representatives from the Production Scheduling Department, its engineering group and Cibar, Inc., a software development firm in Colorado Springs, Colo. The group realized that the MRP system had a great deal of functionality for planning plantwide resource requirements, integrating financial functions with invoices and bills of material and generating managerial reports.

However, what was really needed was timely information directly from the shop floor — the source for information about material usage, job status, personnel utilization and work flow efficiency. The problem was that information about these factors was difficult to obtain expediently and accurately.

Honeywell's system, like most MRP systems, is batch-oriented and relies on paper records or keyboard input for information, which makes data acquisition difficult and time consuming. Consequently, the MRP system often had information about the circuit card area, one of the most time-sensitive areas of the manufacturing plant, which was incomplete, inaccurate and out of date.

The production planners worked with engineering staff to define the functionality and information requirements necessary to schedule, monitor and adjust work flow for optimum efficiency and throughput. They worked with the constraint that the proposed solution could not

See MRP SR/22

Are you ready to upgrade your corporate information system?

1. Your company recognizes that the efficient flow of information is as crucial to your success as any other management function.

2. As your business becomes more complex, you find yourself using "patchwork" programs or "workaround" solutions to get the information you need. Even so, you'd like more visibility, more control.

3. Your management would commit to changing corporate information systems if they were convinced that a new system would work better.

1. MADIC's totally integrated data base management system supplies precisely the information your managers need. Data for any report can be drawn from any file in the system.

2. The product of 10 years of customer-directed development, MADIC probably already has all the capability your company will ever need. Using the Pick operating system, MADIC's 800 programs maintain over 2700 data fields, have 10,000 prompts, and can generate over 3,000 standard reports.

3. MADIC is used in manufacturing and distribution companies large or small, startup or established— discrete assembly, process, repetitive, or job shop operations.

SPECIAL REPORT

Factories adopting distributed intelligence

Combines collection and processing of data, expedites its use

By Shelley B. Dolan
and Robert F. Williamson Jr.
Special to CW

Traditional concepts of factory automation have given way to the evolution of distributed intelligence in factory data collection systems.

The concept of collecting data historically has followed a fairly simple one-way model. Collection devices served only one purpose — to collect data. The information was then sent upstream to the host computer, where it was processed for further use. Thus, data processing has been totally separate from data gathering.

This one-way model has evolved into a more complex, yet more efficient, mode of data collection, largely due to the introduction of distributed intelligence. Because of the drop in cost of machine intelligence — the microprocessor chip — it is now feasible to use in all elements of data gathering. Automated machinery and manual operations, in addition to generating data, now can also use the data immediately to expedite a process, balance inventory or correct a production error.

A simple factory data collection system model consists of a group of terminals (keyboard, bar code or time card) that sends data to a host through a concentrator. Neither the terminals nor the concentrator processes data; they just pass it along, often after a light flashes or a beep sounds to acknowledge that the data has been received. In this model, all data processing takes place at the host, where reports are generated and become available to the plant manager, foreman or production worker hours or days later.

In the distributed intelligence system, the terminals and the concentrator, or controller, are equipped with microprocessors. While data is still sent upstream to a host, some of the data can be processed instantly at the terminal level. The advantage for the factory is that distributed intelligence greatly increases the use of data at the workbench.

Data collection methods

In the factory, there are three major methods by which data is collected: manually, as in filling out a time card; semimanually, as in key entry or bar code reading; and automatically, with machinery. The data varies according to the type of information transmitted, the speed of transmission and accuracy. Without the option to perform partial processing or to send information to the next workstation for immediate use, report generation is delayed until all data is entered, checked, sent upstream and processed at the host.

The value of distributed intelligence enters at this point. By placing intelligence at the terminal and controller levels, the option becomes available to process some data at the terminal workstation. Although the terminal can only do limited processing, it should be enough to meet the needs of the user at his workstation.

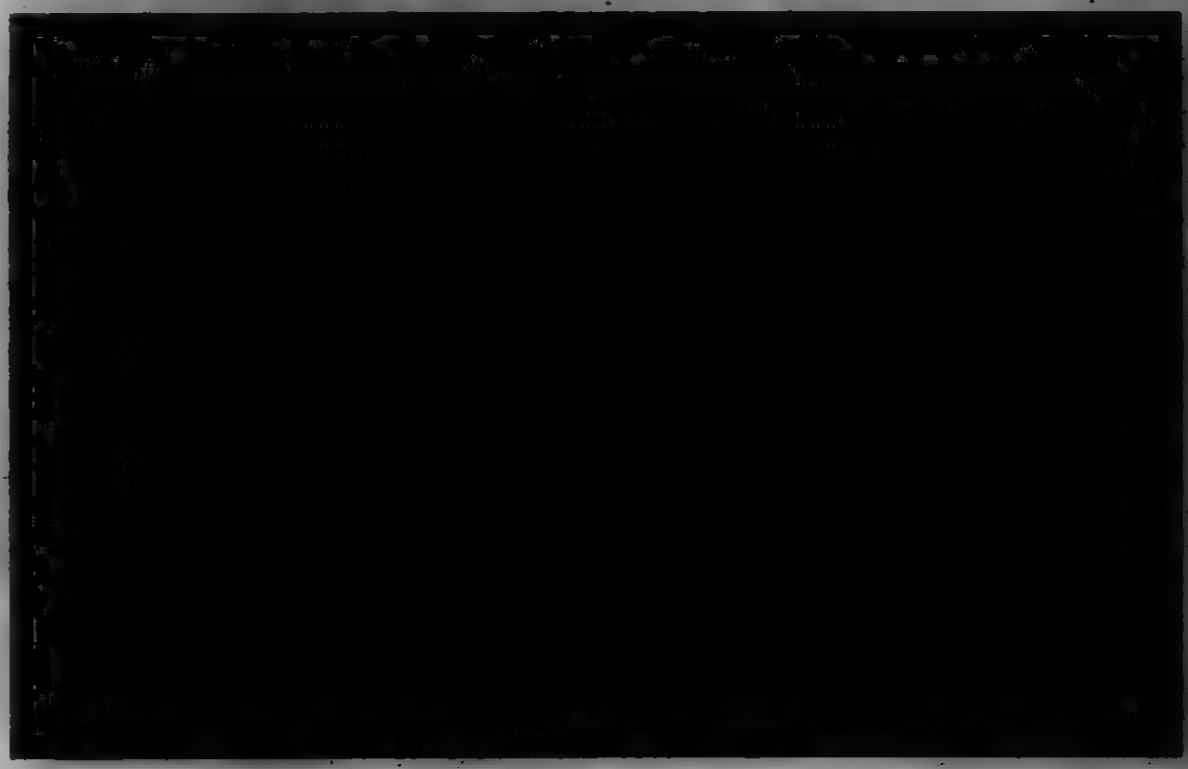
With an intelligent terminal at a robot station, the plant foreman has the ability to monitor the robot's output and to transmit to the next workstation information such as, "Five parts are on the way." The intelligent terminal at the next station, a manual assembly point, can prompt the worker through assembly steps and cue him to enter data before the product is sent to the next workstation.

Perhaps one of the most important plant functions is inventory monitoring. Placing intelligent terminals at robot stations, workstations and inventory cages can help to balance out the imparities in data collecting and transmitting capabilities between workers and machines. Excesses and shortages in inventories can be more readily identified. Higher than normal reject levels can be quickly identified, allowing the worker to deal with the problem immediately. Because the terminals are intelligent, they can receive data from the controller and the host, indicating changes in the work process.

Distributed intelligence is having a large effect on factory automation, especially with respect to the interlinking of data collection devices and processes. Traditional manufacturing technologies are changing due to a need for more efficient modes of operation. Intelligent terminals situated at workstations and robot stations provide an information interchange among themselves, the host and the controller, allowing for effective checks and balances on the shop floor. From this standpoint, distributed intelligence has become the key to peak efficiency in the automated factory.

Dolan is marketing manager and Williamson is vice-president of Innovative Electronics, Inc., a Miami-based manufacturer of data communications equipment.

Combining Boeing's distributed services with IBM's PCs could revolutionize your financial planning.



We know.

Introducing a totally new program from Boeing Computer Services. Designed to help you take maximum advantage of IBM's technology in microcomputers. While ensuring you get the same reliable, high quality computing solutions that are synonymous with the name BOEING.

For financial planners, Boeing offers the EIS® Micro Workstation — a distributed extension of the well-known EIS Decision Support System. EIS software gives business managers the information they need. Faster. More accurately. Without complicated computer programming. And now delivered economically to your desktop, via the IBM PC/PCXT.

The EIS Micro Workstation lets you download, manipulate and upload data to our MAINSTREAM® remote computing network. It gives you extensive graphics capability. What's more, with MAINSTREAM power, you gain access to the many economic and financial data banks you need for up-to-the-minute modeling. And through our Value Added Dealer (VAD) relationship with IBM, Boeing can be your single, reliable source for host processing, PC/PCXT hardware, software, maintenance, consulting, and training.

You save valuable financial planning dollars while gaining greater control over your planning and business management.

The EIS Micro Workstation is just one more unique service from Boeing, a leader in software and computing solutions. Give your decisions more support. Call 800-447-4700. Or write Boeing Computer Services, M.S. CV-26-9A, 7980 Gallows Court, Vienna, VA 22180.

BOEING COMPUTER SERVICES A Division of The Boeing Company

Boeing is an authorized Value Added Dealer for the IBM Personal Computer and Personal Computer XT.
IBM is a registered trademark of International Business Machines.
EIS and MAINSTREAM are registered Service Marks of The Boeing Company.

Size us up.

We solve tomorrow's computer problems today. EVERYWARE™ systems from Perkin-Elmer.

With so much at stake, your doubts about choosing the right computer system are well-founded. That's why you should take a look at the one family of computers that without a doubt offers everything you've been looking for: EVERYWARE systems from Perkin-Elmer.

The EVERYWARE family embodies a comprehensive merging of the world's major hardware, software and communication standards. A solution for virtually every computing need. Ready to grow with you, while protecting your software investment and data integrity every step of the way.

A Comprehensive Family.

We offer one of the broadest choices of mutually-compatible professional micro and supermini computers, easily integrated and supplemented as your processing needs change. Our Series 3200 32-bit superminis span a complete spectrum of computing capabilities with outstanding performance. . .from the compact, economical 3205 to the incredibly fast and powerful 3200 MPS. And all points in between.

The newest member of our family is the advanced, M68000-based 7350 super micro, bringing EVERYWARE systems to your desktop. With vivid color graphics. Windowing convenience. And

a choice of off-the-shelf applications software–including word processing, spread sheets, graphics packages and development tools.

Operating Environment Flexibility.

Only EVERYWARE systems offer such diverse operating environment alternatives. Real-time processing under our proprietary OS/32 operating system. Reliance PLUS, our proven on-line relational DBMS that enables powerful, user-friendly transaction processing. The Resilient System,™ a new concept in fault tolerance that offers the high-availability advantages of two real-time, on-line processors while assuring 99+% uptime. Or time sharing. Or batch processing. Work in the environment that suits your needs. Or run any combination of them simultaneously through one powerful system!

To protect your single most important investment–the software–EVERYWARE computers offer a common operating environment derived from world-standard UNIX® software. Via FORTRAN and C, it's bridged to our OS/32 real-time operating system. That's the best of both worlds. And results in true software portability, from system to system, environment to environment.

Communications Everywhere.

We can share information with IBM environments via SNA and BSC emulators. Form a local network using Ethernet. Or communicate globally through the CCITT X.25/X.29 Packet Switching Network.

And that's about the size of it. Except to remind you that Perkin-Elmer is strongly committed to supporting your systems with complete customer training, worldwide service. . . and world-class products.

We invite you to "size us up" soon.

VISION from SR/11

256 levels of gray. The system calculates nearly 80 million convolutions per second. The controller used is an IBM Personal Computer.

A system from International/Robomation/Intelligence in Carlsbad, Calif., uses a dedicated, highly integrated microprocessor incorporated into a multiple-processor architecture. A systolic-array coprocessor is used to build up the speed of the host from one million instructions per second (Mips) to 40 Mips.

After the camera samples the scene, digitizing is performed by the preprocessor, which also computes histograms and performs contrast analysis. The host processor and coprocessor examine gradients and detect edges, sharpen edges through a Laplacian convolution, analyze moments, perform comparisons with the data base and report on matches. The important feature here is the special coprocessor.

Object Recognition Systems (ORS) in Princeton, N.J., has an I-Bot 1, consisting of an ORS vision system utilizing special algorithms designed to deal with randomly oriented, overlapping parts. This vision system works in conjunction with a robot in performing bin picking.

The main problem with vision systems is still the high price/performance ratio. Typical system prices range from $25,000 to well over $100,000.

Even though prices have been dropping or performance has been mounting for a given price, these systems are still too high-priced for many routine automation processes.

Control Automation in Princeton, N.J., has just announced a high-performance, low-cost system that is programmable in Forth, a language that is becoming popular in factory automation. The unit scans 64 shades of gray and handles 16 cameras, expandable to 64. Resolution is 380 by 480 pixels.

Speeding automation

Systems such as these are playing a significant part in speeding up factory automation. Among the processes receiving increased attention are welding, painting, bin picking and assembly. Assembly constitutes a major part of production.

Vision systems help in the fitting process in automated assembly by enabling parts and components to be identified, acquired and presented in a predetermined manner. They also help eliminate costly jigs in robot assembly by providing proper feedback to control the position of assembly tools in an adaptive manner.

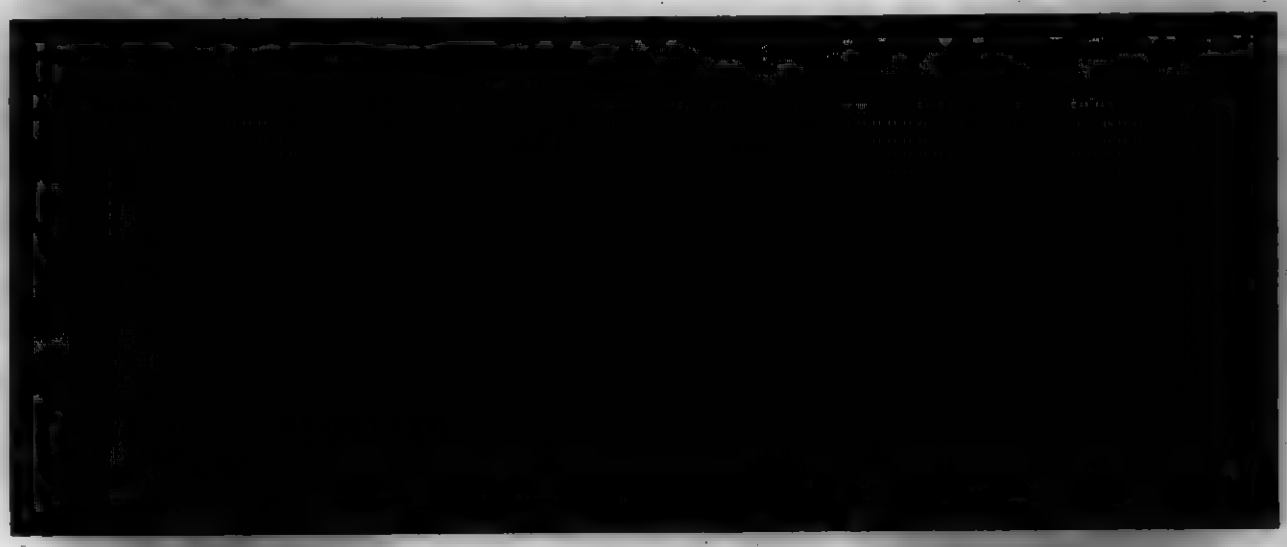
Thirdly, vision systems can continously control the path of a tool along a designated trajectory. A closely related function is in-process inspection.

Tool control for positioning or orientation is also important in fastening. Typical fastening processes are spot welding, arc welding, screwing, riveting, bolting, nailing and stapling. Vision is playing a rapidly growing role in welding.

Bin picking is another area where increasing emphasis is being placed on the use of vision systems. In this process of acquiring work pieces one at a time from containers and relocating them at predetermined places with predetermined orientations, a good deal of sophistication is called for in the vision system.

Today's vision systems are far superior to those of a couple of years ago as far as robotic applications are concerned. Even though gray-scale capabilities are much better, even better capabilities are needed as robots are called upon to see all images regardless of background lighting or overlapping. More and more powerful algorithms are being generated in order to get the greatest benefit from modern computer hardware.

Lakshmanan is a project director for Frost & Sullivan, Inc. in New York.



Spectragraphics 1500.

IBM 5080.

The chart at the right speaks for itself.

With the exception of delivery. Something we offer *now.*

Which means if your CAD/CAM or CAE needs call for an intelligent color graphics system, maybe you should take a look at our Spectragraphics 1500.

A color system with a superb reliability track record.

A system with real time 3D graphics 10 times faster than IBM's. Ten times.

A system that runs on IBM CAD/CAM software.

A system with greater communications support via fiberoptics, T1, microwave or low-speed V.35.

And a system *already delivered,* up and running in major CAD/CAM users across the country.

All coupled with one of the industry's most versatile software packages. PRISM.

Plus an enviable list of features ranging from decluttering to backsurface testing to real time polygon fill and transformations.

So before you let the IBM 5080 chart your company's course, spend a few quick minutes surveying the chart.

Then spend a few quick seconds dialing Spectragraphics. We're faster, less expensive and maybe most importantly, we're better.

Come see us at the N.C.G.A. show

SPECIAL REPORT

Middle managers feeling automation ax

By Theodore T. Zajdel
Special to CW

The implementation of today's more sophisticated factory automation systems often results in job displacement among the middle managers required to implement them. These middle managers are faced with a difficult choice. If they strive to implement the new system successfully, they may end up losing their present job and facing an unknown future. Resisting or even sabotaging the implementation carries its own risk. The implementation may be delayed, but it is rarely canceled. The recalcitrant manager is often the first to go.

Job displacement among middle managers due to factory automation is a relatively new phenomenon. In the U.S., job displacement discussions have revolved around the blue-collar worker and how to manage the resultant problems without strikes or other disruptions. The middle manager was not directly affected because of the low level of factory automation being implemented.

The first stages of factory automation involved the introduction of automated or numerically controlled machines such as lathes, milling machines or automated insertion machines. These machines increased productivity by increasing simultaneously the number of items produced per worker per shift and increasing the quality by decreasing operator involvement and resultant error.

Materials handling systems, automatic warehouse systems and systems to monitor materials flow or work in process sometimes resulted in job displacement among blue-collar workers. If anything, these systems increased employment among middle managers, who were responsible for planning and then monitoring the reports produced by these systems. Manufacturing resource planning (MRP) systems and the general factory data processing systems improved productivity and reduced costs, but had little direct impact on employment among blue-collar workers. Again, they created white-collar jobs.

The advent of management information systems with variance reporting, simplified interactive I/O, spreadsheets, sophisticated graphics and the increasing familiarity of managers with personal computers has begun a radical change. The upper level manager or executive can now directly access the data base and obtain information about the lowest level of the factory hierarchy without going through the intermediate management levels.

Advanced management information systems are used to tie together all of the various automated or computerized systems in the factory, from MRP and the DP center down to individual automated machines.

Direct access to all levels

Using such an advanced management information system, the director of manufacturing gains direct access to all levels of the factory. Previously, the information was available, if at all, only after being passed through several layers of middle management. With advanced MIS, this information becomes available faster and often more accurately, directly from the factory floor.

The successful implementation of advanced MIS as part of an overall factory automation project resulting in computer-integrated manufacturing can lead to the displacement of many middle managers. Factory automation of the computer-integrated manufacturing variety results in an organization consisting of blue-collar workers and high-level managers, but few middle managers.

> ***Without the cooperation of the middle managers, the implementation of a successful factory automation project and, ultimately, of computer-integrated manufacturing is difficult if not impossible. The question is how to secure their cooperation when it may hasten the loss of their own jobs.***

When building a new automated factory, this is not a problem. No jobs are eliminated. Only sufficient managers and other employees are hired to operate the factory. The problems arise when trying to automate an existing, functioning factory. Then all the normal problems of change are faced in addition to the problems arising from potential job displacement.

The job displacement problems are exacerbated when middle-management jobs are involved. When blue-collar jobs are eliminated, the displaced worker is rarely involved with the implementation of the new automated equipment and thus is unable to impact its success directly. However, when middle-management jobs are eliminated, these same managers are often intimately involved with the implementation and ultimate success or failure of the project that will culminate in their job loss.

The reason for this is that the middle managers have the information that must be incorporated into the system. The ways in which reports are formulated, data obtained and productivity measured under the prior operation must be carried over to the new system in order to ensure a smooth transition. This does not imply that changes cannot or should not be made. But the new system must be integrated with the existing, functioning system over a period of several years. Otherwise, productivity may drop precipitously, and the entire operation may be disrupted.

Without the cooperation of the middle managers, the implementation of a successful factory automation project and, ultimately, of computer-integrated manufacturing is difficult if not impossible. The question is how to secure their cooperation when it may hasten the loss of their own jobs.

A technique that is doomed to failure, but often tried, is to attempt to hide the outcome from the participant — in other words, pretend that nothing will happen; no jobs will be eliminated. However, someone intelligent and experienced enough to be a manager will surely see through the deception and will resist the project, if not act to sabotage it outright.

Another technique is to let the competition unleashed. Usually the results are the opposite of those desired.

A better technique is to plan for the changes and to develop solutions for the resulting displacements. Retraining is one part of the solution. Communication is the other.

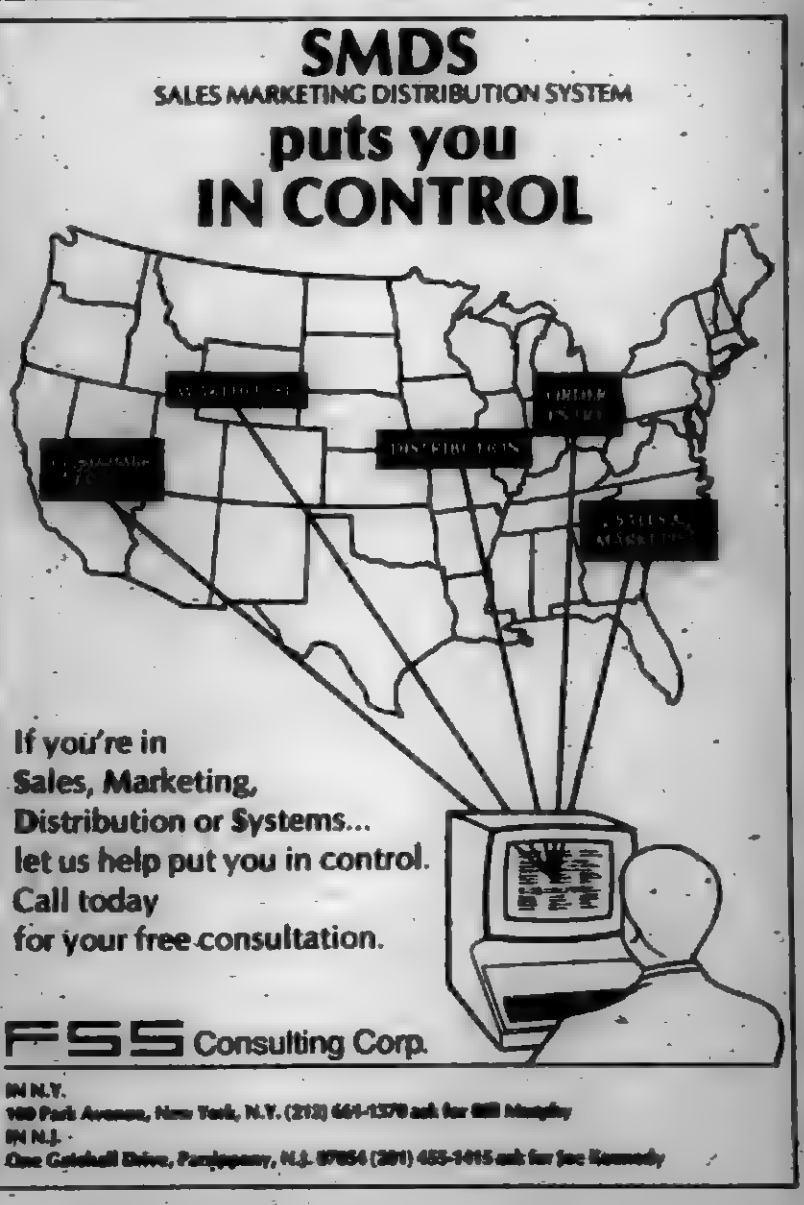
Implementation of factory automation gives many opportunities for retraining in computer-related jobs. Most importantly, by retraining, the company retains the practical knowledge and job skills of its employees. Who knows the day-to-day operation and problems of the factory better than the people who have worked there for years and perhaps came up through the ranks?

Knowing the future job opportunities and being able to train for them can go a long way toward encouraging middle managers to cooperate enthusiastically in the implementation of advanced factory automation projects that may result in the elimination of their present jobs.

This same approach should be used with blue-collar workers being displaced by factory automation. While they may be less able to hinder a factory automation project directly, companies can ill afford to lose the talent and expertise that reside in many of their skilled blue-collar employees.

It is certain that over the next 10 years the implementation of advanced factory automation systems and the emergence of computer-integrated manufacturing or the factory of the future will result in rapid change at all levels, from the blue-collar worker to the executive suite. Only through planning and retraining will smooth transitions be possible. The detailed knowledge of the manufacturing process and its problems cannot be lost by a company if it hopes for long-term success as opposed to short-term savings.

Zajdel is a senior partner at The Research Collaborative, a Boston-based management consulting firm, specializing in high technology.



BE A HERO. BUY A HERO.

Heros were meant to rise above it all. So why is it you keep getting caught in the middle? Is it your fault that personal computers in every department are hoarding data? They won't even have a simple conversation with the mainframe.

Why should you be pestered by complaints when work is lost? Or duplicated? Even triplicated? Not to mention what happens to costs.

Your organization is a victim of Computer Shock. Badly in need of a HERO™.

HERO RESCUES COMPUTER WORLD FROM CHAOS.

MDS HERO is the intelligent, desktop Networked Personal Computer. It does everything a personal computer can do. And more. But most of all, our HERO is famous for interacting—it works beautifully with mainframes.

With the MDS SUPER 21™ Communications Processor, HERO can converse intelligently on IBM networks. HERO emulates IBM 3270 SNA and 3776 remote job-entry systems. Our SUPER SNA™ option gives you both on one communications link.

HERO also runs software under MS-DOS. Plus its own multi-tasking operating system.

HEROS OF THE WORLD UNITE.

With HERO and SUPER 21 on your side, there's no end to what you can conquer. You can draw on private, departmental, and corporate databases. Bring individual workstations out from their isolation. Thanks to you, information will be bound together, in a network of organization. All under your control.

What's more, if you take advantage of our own INTELLIGENT 3270™ (only MDS has it), your people can write their own programs, and integrate them with data in the mainframe. Using HERO, you can reach into the database and retrieve information. Then either return it, or store it at the workstation.

HEROISM GETS REWARDED.

With our HERO and SUPER 21, you'll have what's out-of-control under control, fast. Your current data processing investments will become part of a growing bank of knowledge. All of it cost-efficient.

Besides, old HEROS never die. Nor do they fade away. They're modular in design, so they manage to be immortal. They grow with you. All the way.

YOU CAN BE BIG WITHOUT BEING BLUE.

MDS is everywhere Big Blue is. We even stretch beyond the Blue horizon. And we grew big for one big reason: we've helped our customers to grow.

MDS can do the same for you, too. Wherever you are on this Big Blue planet, we'll give you more than mere office automation. We'll organize your organization. Our service people will be at your back and call. Around the globe. Around the clock.

So be a hero. Buy a HERO. Ask our customers about us. And give us a call. Dial **800-MDS-HERO.**

You'll soon see that heroism has its rewards.

MDS MOHAWK DATA SCIENCES

MRP from SR/14

add significant software overhead or degrade the response time of the MRP system, yet the information had to be available for use by the system. The solution was to design a stand-alone system that could communicate with the existing MRP system, which runs on a Honeywell DPS 8 Model 44 with 4M bytes of main memory. The data base takes up 300M bytes of disk storage. The system supports 75 to 85 on-line terminals running 12 hours a day.

The Production and Manufacturing Information System (Promis) was designed by Cibar and provides shop floor control, work-in-process and stock inventory maintenance and timekeeping functions in a stand-alone system that has the capability for information exchange with Honeywell's MRP system.

The primary objective of complete work flow control would be attained by collecting information from the circuit card area employees about their time utilization using the information from assembly routing sheets. Other information from the sheets would be used to define and control assembly sequencing and to monitor the location and status of all parts and assemblies.

Bar code data collection technology was chosen for data input because it provides rapid, accurate information collection from numerous sources very cost-effectively.

The capture of all this information and the availability of it in real-time and on-line would provide several benefits:

- Accurate cost allocation procedures for direct and indirect employee time.
- Reduced amount of scrap from improper assembly routing sequences.
- Comprehensive inquiry facilities to locate parts, jobs and production trouble spots.
- Accurate assessment of work-in-process levels and overall work loads.
- The capability to assess accurately standard production times, employee efficiency and current backlog for accurate production scheduling and completion time estimation.

This design was based on the premise that the information could be input by the employees who generated it. This would eliminate redundant data input and its accompanying inefficiencies. It also implied that the data collection methodology had to be easy to use and could not interrupt the work flow.

Bar code data collection technology was chosen for data input because it provides rapid, accurate information collection from numerous sources very cost-effectively.

It is easy to use and can quickly become a part of the employee's work cycle. Since it eliminates the need to fill out time cards, it actually speeds up the production process rather than inhibiting it with excessive monitoring.

Bar code wand stations were located throughout the production and inventory areas to collect information from bar code labels on employee badges, work orders, material totes and menu pads.

The employees were instructed to record the receipt of a job at a workstation, the completion of work at their stations and the movement of work from their stations. This information is input with the bar code wand and labels.

Maintains routings

Promis maintains a routing for each assembly released to the shop floor. The system uses this routing as a guide while it monitors material movement throughout the assembly process and will not permit an employee to move a job to a work center that is out of sequence in the routing.

Timekeeping functions are processed automatically by Promis, which maintains a complete record of direct and indirect time accumulated by each employee. This information is also accumulated for each job for cost allocation and scheduling information.

The work-in-process dispatcher is able to inquire about the location, priority and status of a job that might have segments in several locations within the work-in-process carousel as well as on the production floor. Using this information in conjunction with work center load data, the dispatcher is able to balance work flow on the assembly lines.

The schedulers are now able to answer inquiries from other departments using on-line information available immediately on a CRT terminal. They have a complete record of all engineering change orders applied to assemblies and can inquire about reject and rework information as it pertains to an assembly or to employees.

The system achieved its design goals because a thorough analysis of the work flow and information components available from the shop floor was performed.

This was correlated with the scheduling department's requirements for accurate planning and monitoring functions. The implementation of the system as a stand-alone gives it excellent response time and flexibility while maintaining the capability to provide the MRP system with accurate, timely information with a minimum of software and response time overhead.

MRP VERSUS OPT:
SOFTWARE vs. THOUGHTWARE

Creative Output, Inc. is a management systems firm whose products allow manufacturing organizations to identify and realize their full commercial potential.

Wang helps you manufacture the ultimate product: profit.

Whatever you may make, you have to make a profit.

And Wang office automation systems are uniquely qualified to help.

Wang systems tie every department together with word, data, image and audio processing. From engineering to accounting, to legal, to purchasing, to personnel. In every location, from your headquarters to your most remote shipping platform.

What's more, Wang integrated systems offer dozens of successfully-used applications you can put to use right away. Software is available for master production scheduling that will help eliminate bottlenecks; for material requirements planning that will reduce your inventory investment; for shop floor control that will reduce your overtime and expediting costs. And on and on.

All completely functional—right now.

With Wang, you can see whatever you need to see, whenever you need it. Including better profits.

For a demonstration of Wang computers, call 1-800-225-9264. Or send this coupon to: Wang Laboratories, Inc., Business Executive Center, One Industrial Avenue, Lowell, MA 01851.

SPECIAL REPORT

Criteria for pushing automation to its fullest

By Robert L. Howie Jr.
Special to CW‡

Five criteria must be met for computerized automation of information management, engineering and production to achieve its full potential:

■ Management commitment to automation at the highest levels.

■ A complete understanding of application requirements.

■ Optimum materials management.

■ Subsystem investment with integration in mind.

■ A concomitant belief that manufacturers will build solutions by managing technology, not just automating.

That leads to a sixth ingredient: The corporate business plan must be linked to manufacturing operations, and that business plan must drive the building of manufacturing competence.

The next generation of manufacturing technology will be devoted to integrating manufacturing functions with management information systems. This will require innovative manufacturing data base management to provide easy storage, retrieval and manipulation of large quantities of data; full data communications to distribute design, engineering and production data over a network of computers; operating systems and applications software as a foundation for a fully integrated system; and integration engineering services for systems capability planning.

Communications is undoubtedly the key to integration and to building the future factory. The major components of the manufacturing environment — computer-aided design and engineering, machine tools, materials handling systems — must be tied together.

On the shop floor, such a communications system enables a quick response to sudden changes in process conditions — for example, overload or device breakdown. Essentially, this kind of industrial local-area network provides real-time access control.

The industrial local-area network is an intrafactory communications system that ties together and supports transparent information transfer between users and intelligent shop floor automation. The key word is transparent; the local-area network represents a pipeline with added value and provides a standard architecture for machine-to-machine and man-to-machine interfaces.

Part of total

Local-area networks do not stand alone; they should be seen as part of a total systems approach, supporting the sale of peripheral devices such as programmable controllers, robots and other shop floor automation that will hang on the networks.

Industrial local-area networks require specifications much stricter than those targeted for the office: Factories are often noisy and corrosive, and electromagnetic interference degrades communications capabilities and durability. Factory communications are much more performance-conscious — and less cost-sensitive — than those of the office, and users can expect to pay a premium for reliability, data integrity and guaranteed access time.

The issue of standards remains paramount. Each of the competing companies in this market has developed its own proprietary communications system. Acceptance of any one standard is a long way off. Standards in factory communications will take shape differently from standards in the office.

Howie is director of marketing of the Factory Systems Planning Service for The Yankee Group, a Boston consulting firm.

GM controllers solve materials handling

By directing disc brake assembly parts over mile-long conveyer

SAGINAW, Mich. — A programmable controller serves as the primary intelligence device to operate and control a complex conveyer line that runs over one mile at a General Motors Corp. automotive manufacturing plant here.

Programmable controllers have solved a complicated materials handling problem on the GM Manufacturing Division plant's high-volume conveyer and transfer system, which is used for machining steering knuckles here. The knuckles are part of a disc brake assembly used on front-wheel and rear-wheel-drive cars.

Where a pair of redundant Digital Equipment Corp. PDP-15 computers formerly were employed, a Gould, Inc. Modicon 584 programmable controller now makes the necessary decisions and executes the divert algorithm to control the conveyer system, relieving a redundant pair of DEC PDP-11/70s for more urgent tasks. The programmable controller is interfaced to the PDP-11/70s using twisted wire pairs.

Steering knuckles are transported on pallets attached to a chain conveyer that is installed at the plant's ceiling level. More than a mile long, the conveyer is similar to a railroad, with spur lines or side tracks leading to the various machining operations located throughout the 200,000 sq-ft area of the building. This main chain conveyer is primarily used to transfer parts from machine to machine. However, it also provides an inventory of parts between operations and can store more than 20,000 steering knuckles.

Spur lines receive pallets of knuckles destined for one of three different machining operations. These spur lines also provide a parts bank ahead of each machine to ensure a steady flow of parts to each of the machining operations. When the spur line is saturated with pallets, the control system diverts additional pallets back to the main conveyer or to an additional storage loop that can retain the pallets until they are required for one of the machining lines.

As a carrier travels along the main conveyer chain, each time it approaches a spur conveyer, the control system executes a divert algorithm. This decision, rendered by the programmable controller, determines the path of the carrier — whether it stays on the main chain conveyer or whether it is to be diverted into a spur line for a machining operation.

System design criteria

Some of the design criteria that make up the control system include:

- Parts type separation.
- System balance.
- Storage loop allocation.
- Lot control.
- Man/machine interface.

Parts type separation refers to the fact that the system produces three different sizes of knuckles that are used on a variety of disc brakes for compact, mid-size and full-size cars. Plant mix for the various knuckle sizes can change daily, since all sizes are not necessarily run each day. As a carrier approaches a spur, the control system must consider its sequence in the machining process and the type of parts the carrier contains.

Another critical factor for the system is line balance, or consideration for the machining operations that operate at a variety of speeds. The number of parts per hour that each machine can produce varies from 400 to 600; line imbalance is caused by variations in production rates and by machine utilization that is usually less than 100%, a combination that can force the system into a continuous state of imbalance. Smooth operation can be achieved through a complex algorithm that allocates units to the storage system with maximum efficiency.

A storage loop in the conveyer system is used to achieve line balance and serves as a surge tank for the main conveyer. The control system determines the optimum number of carriers on the line and switches all excess carriers onto the storage loop. If the carriers completely load the line and the storage loop is also filled, the control system shuts down that particular machine operation until there is space available on the line.

Lot control is a factor that determines the relative age of all the parts on the line and attempts to use the oldest parts first. A decision has to be made as each carrier approaches a spur line. The controller must look ahead and determine if the machine is running and if there is any storage space left on the spur line, which normally holds four or five carriers. It also must determine if any of the other spur lines have more urgent needs; if so, the carrier will pass by and be directed to a more needy machine.

The man-machine interface is required to start, stop or change the status of the control system. It gives the operator the ability to cope with the day-to-day problems of overriding the control system with human input. Items under human control include carrier data interrogate or update. This capability allows an operator to assign any carrier to a special destination for rework or to achieve system balance. It is also possible to direct a carrier to a repair station, if necessary.

Control of the conveyer line is achieved with a hierarchical control pyramid. At the base of the pyramid are 12 Gould Modicon 484 programmable controllers that are referred to as automation controllers. They operate each of the spur lines and take control of the carriers once they are diverted onto a spur. The programmable controller unloads the parts from the carrier, delivers them to the machine tool and reloads the machined parts into the carrier. Loaded carriers are then routed back on the spur line and merged into the main conveyer.

A second level on the pyramid controls traffic on the main conveyer line. For this part of the system, there are three remote I/O drops from the 584 programmable controller that are referred to as recirculation panels. These panels direct the carriers through the spur entrance on the main line and prevent collisions at the spur exits and around corners on the main conveyer. Each panel is responsible for a portion of the overall conveyer system.

A third, or intermediate, level of the control pyramid has a Gould Modicon 584 programmable controller that controls the main conveyer. This controller is the primary intelligent device for the control system. A second Modicon 584 is installed to serve as a backup unit to the primary programmable controller. The system allows manual switch-over to the backup controller if it is required. At the top of the control pyramid are the pair of redundant DEC PDP-11/70 computers. The computers are used for monitoring machine operation or for controller support, report generation or backup data monitoring to track the current status of the conveyer line in case of a failure at the intermediate control level.

In former control systems, the primary function of the computer was to execute the divert decision at the spur line. With programmable controllers making these decisions, the computer is relieved of this real-time decision making, thus allowing it to be assigned additional tasks.

Network links conveyer system components

SAGINAW, Mich. — Since the conveyer system at General Motors Corp.'s Saginaw Manufacturing Division plant uses many hierarchical levels and types of intelligence, there must be a form of communications network between all of the components in the system.

The 12 automation controllers and the three I/O drops use the simplest form of communications, with a network of hard-wired interlocks. Other networks in the system include a Gould, Inc. Modbus network for remote programming hookup to each recirculation panel and a baseband network used by the main conveyer controller to converse with the remote I/O of each recirculation panel.

A broadband link to the computer communicates with the automation controller, the main conveyer controller and the transfer machine or machine tool controllers. All the hardware in the system is configured in a hierarchy that has a maximum dispersal of intelligence and uses several independent communications networks to achieve complete control of the conveyer system.

Each level of the control system is designed with a number of maintenance tools. The automation panels have graphics displays that illustrate the loading and unloading of the carriers. The status of all limit switches, solenoids and various internal logic conditions is shown on these graphics panels, which also can be used by maintenance personnel to aid troubleshooting.

A Modicon P464 remote monitor allows interrogation of all registers, inputs and outputs. Except for the logic, the total status of the programmable controllers can be determined with the remote monitor, thereby eliminating a bulky programming panel. The monitor also makes the information gathered by the controllers accessible to the operator or to maintenance personnel.

Another maintenance tool developed with the control system is a remote register access panel that is mounted on the recirculation panel door.

The remote register access panel is used for interrogation of the programmable controller status and also as a fault display system. The panel consists of a four-digit display, an array of 16 lights and a chart that identifies the I/Os and other connections of the system and a single fault light.

A multiplexer is used to obtain information from the carriers. Readers at each divert point use a multiplexing scheme to a single input.

The control system uses a structured data base. The basis of the entire logic program is a structured format. This data was constructed first, and it consumed several months of design effort. With the structuring of the data base, the structuring of the systems logic occurred naturally. For this structuring, the main conveyer controller was regarded as a computer, with computer concepts applied to the logic of the programmable controller.

When a new tape is loaded into the main conveyer controller, it activates the initialization task. When this task is invoked, all motion of the carriers is stopped and the controller data base is wiped clean. The computer can then update the current status or proper data base to the programmable controller.

To aid in solving the complex divert algorithm, a linked list is used. This is a method of organizing blocks of information in memory. Each block has a trunk that points to the next block of information and a tail that points to the previous block. By sorting the information in memory prior to the actual decision making, the time required to solve the algorithm is reduced.

A polling system is used to reduce the communications overhead associated with programmable controllers. Each time the programmable controller changes its data base, a flag is sent to the computer. The computer constantly monitors these flags and when it detects a change of state, it only reads that portion of memory that has changed.

SPECIAL REPORT

Programmable controllers altering shop floor

By John G. Rowe
Special to CW‡

The success of factory automation technologies begins and ends with their impact on the functions of the factory floor. All of the various types of computerized manufacturing systems — material requirements planning, computer-aided design and manufacturing, robotics programming systems, numerical control programming systems, inventory control and shop floor scheduling — have as their central purpose the support of production on the floor.

A microcomputer-based revolution is occurring in control techniques down on the floor itself, a revolution that currently tends to be overshadowed by these more glamorous applications. This trend toward microcomputer control will have an impact as large as, if not larger than, the introduction of the microcomputer into the office and home. This factory micro is the programmable controller.

Programmable controllers employ stored programs in memory, recognize inputs and outputs by fixed address locations assigned to each, make logical decisions and generate commands. They also communicate quite easily by direct wiring with the devices that they monitor and control. That control consists of interpretation of simple binary events such as on/off, empty/full or hot/cold signals and data events such as time, position or product levels. In other applications, more complex sequencing, analog data interpretation and sophisticated data handling are used.

Two-part composition

The programmable controller is composed of two parts: a CPU and an interface. The CPU consists of a power supply, memory and the processor. The processor makes control decisions based upon the application program stored in memory. The interface isolates the CPU from industrial noise and provides signal conditioning to control external devices. I/O or servo control modules form this interface between the processor and the controlled operation. The input control or sensor devices on the machinery are wired to the input modules, which convert the signals to the proper voltage to provide machine or process status information to the processor, which in turn decides the appropriate status for the output devices. These signals are converted to the proper voltage and sent to the output devices by the output modules.

More recently, programmable controllers have included such advances as mathematical calculation capabilities, data transfer and comparision and the ability for peer-to-peer communications between common machines via data highways. These data highways are tailored communications networks with the logic to determine which programmable controller is transmitting and which is receiving as well as acknowledgments of receipt. Gateways are then employed for linking groups of programmable controllers from different vendors together or to factorywide networks.

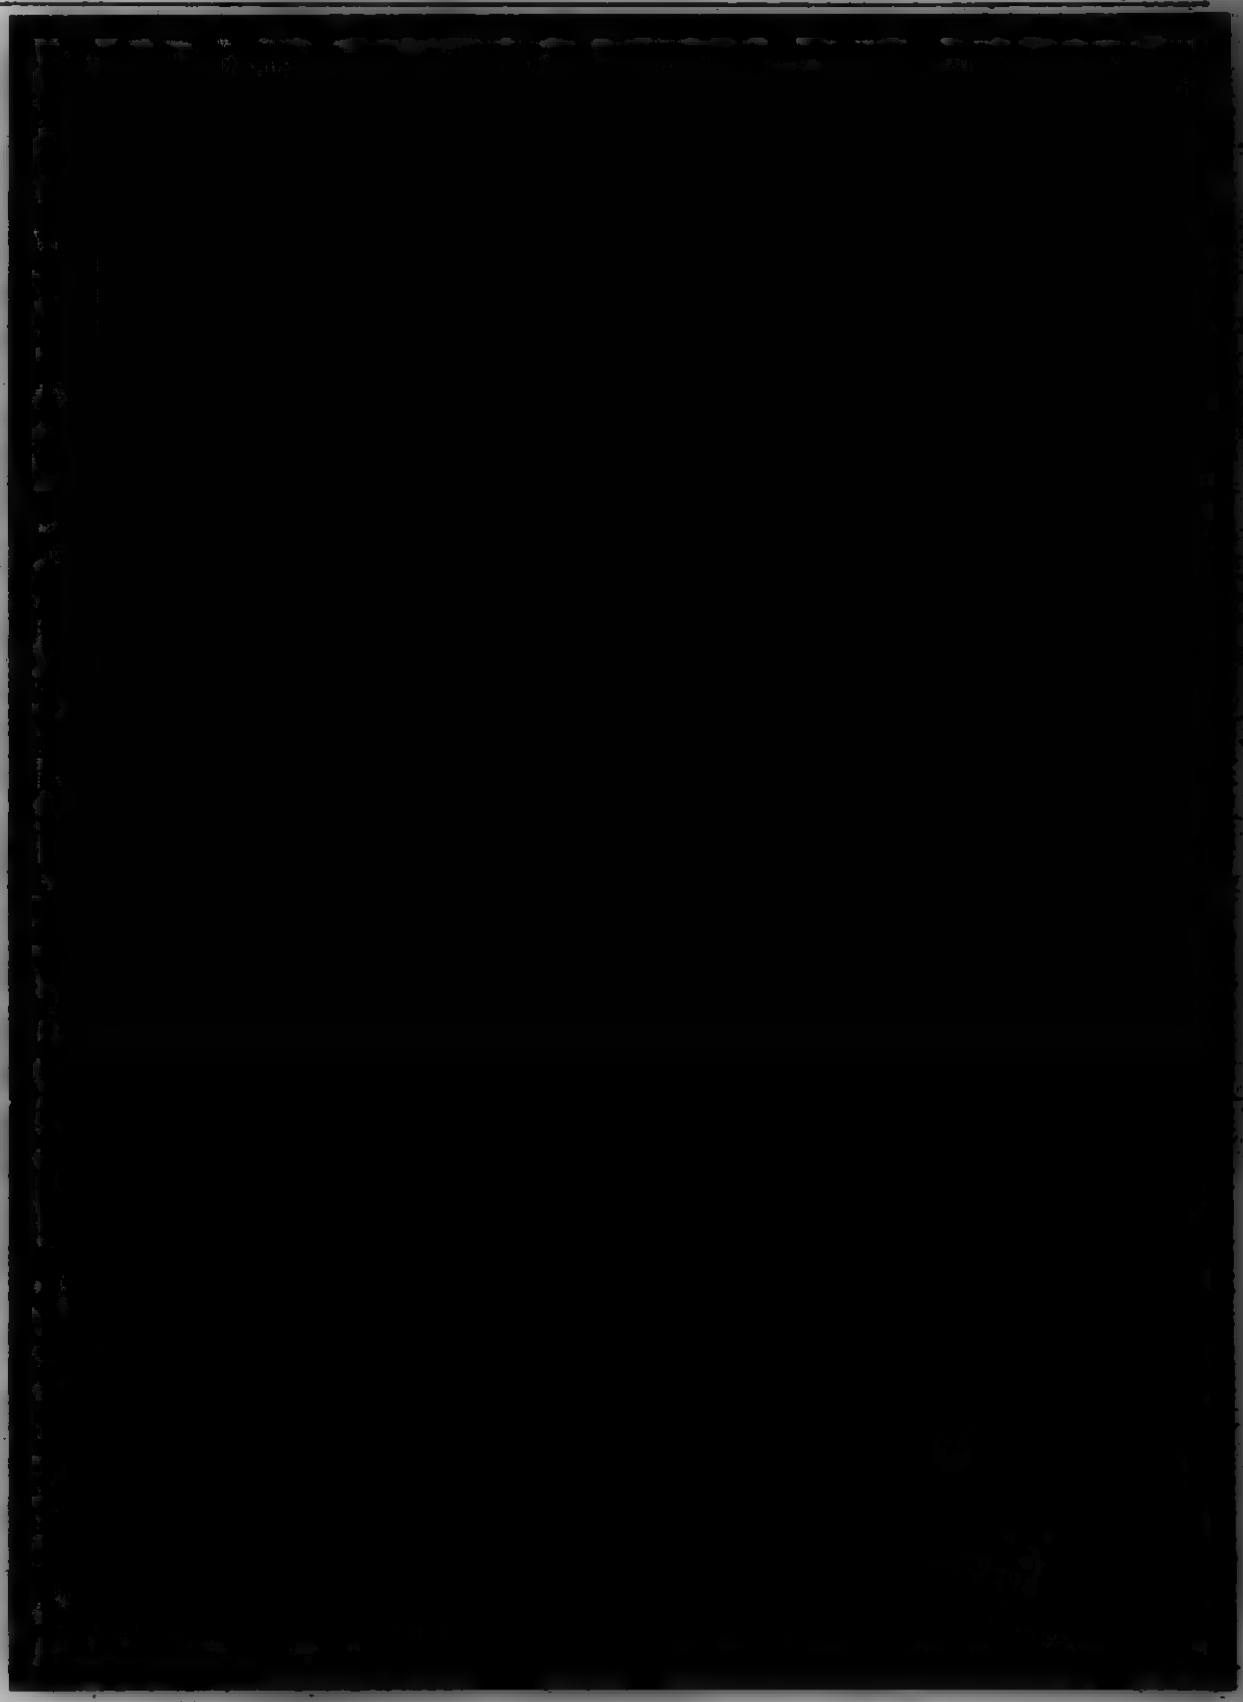
Programming these controllers usually involves the use of ladder logic diagrams — the methodology already used by factory technicians for wiring relays. Thus, ladder logic can be thought of as a high-level, user-oriented language, in that no special computer knowledge is required in the operation or maintenance of programmable controllers. Further, some manufacturers have augmented ladder logic with mnemonic commands or introduced Basic and Boolean logic as alternatives in order to make better use of the logic power of the microcomputer.

Future developments in programmable controller technology will include:

- A standard industrial ladder language.
- Standard communications interfaces and protocols.
- Color graphics in displays for machine programming and monitoring.
- Increasing capability with decreasing cost, as microcomputer-based programmable controllers take advantage of advances in semiconductor technology.

The ability of programmable controllers to handle complex operations and optimize the control of the machine to produce a part most effectively will result in a blurring of the boundary between the logic contained in the numerical control parts program and that contained in the ladder logic at the controller level. Thus, the areas reserved for microcomputer-based programmable controller applications and minicomputer- or mainframe computer-based applications for factory control will become, in time, as indistinct as those reserved for microcomputers and minicomputers in traditional commercial data processing applications.

Rowe is a principal of J.C. Rowe & Associates in Cleveland, a consulting firm specializing in industrial automation.



466 ways to use an HP 3000.

The point of buying a computer is to speed things up. So why let programming slow you down?

With the HP 3000 family of business systems, you can usually be up and running as soon as you plug them in. Because our computers come with a vast range of ready-to-use software that covers the applications spectrum from accounts payable to zoning.

We wrote many of these special programs ourselves. Last year alone, we supplied customers with more than $50 million worth of applications software. Others come from a variety of software firms working closely with us.

So the chances are pretty good that your own programming effort can be trimmed substantially. When you do need to write your own programs, the HP 3000 will help you do it much faster. With our special set of programming tools, customers have cut 500 lines of code down to 100. At about $50 a line, that really adds up.

Here's another way you save. With complete compatibility across the entire range of HP 3000s, you don't have to spend a dime converting software from one system to run on another. That's a big help when you're picking the right computer for a branch office or a regional center. Or any size office in-between.

Press here.

When you write a program for our inexpensive Series 39, you can also use it on our Series 68 distributed mainframe which handles up to 400 users. Or on our mid-range Series 42 and 48 computers.

Here's some more help in making your selection. The HP 3000 costs up to 40% less than comparable systems. So you save on the hardware as well as the software.

If you'd like to see how useful an HP 3000 can be, call your nearest HP sales office listed in the white pages. Ask a Business Computer Specialist for a demonstration. Or write for more information to Tom Rappath, Hewlett-Packard, Dept. 03184, 19447 Pruneridge Avenue, Cupertino, CA 95014. In Europe, write to Henk van Lammeren, Hewlett-Packard Nederland B.V., Dept. 03184, P.O. Box 529, 1180 AM, Amstelveen, The Netherlands.

HEWLETT PACKARD

SPECIAL REPORT

Successful MRP needs full-time project leader

By Carmine B. Morello
Special to CW!

Manufacturing resource planning (MRP) implementation is a long and arduous trek through a maze of well-intentioned advice, essential building blocks treated as givens and a myriad of buzzwords.

Three givens for successful project management are:

- The position of project leader requires full-time attention.
- The individual selected as project leader need not and should not be a systems person.
- Using an outsider as project leader does not enhance your chance for success.

The role of the MRP project leader is to organize and direct the project team, to supervise the implementation of the manufacturing control system, to assist in the development of operational procedures and to coordinate educational schedules and programs. Anyone who has performed any of these tasks can infer that, together, they require the full-time dedication of an individual.

The key words used to describe the role of an MRP project leader are: organize, implement, develop and schedule. Anyone involved with data processing, from coder to MIS director, will recognize these as essential requirements for proper job performance. To assume that a production expert from an informal or expedite-based manufacturing environment will be better suited for supporting a formal, schedule-guided environment is dangerously incorrect. A good DP manager — who must live within the constraints of a scheduled environment, has to react daily to provide needed flexibility, organizes and implements new systems on demand and constantly evaluates efficient operating procedures — is a prime candidate for consideration as a project leader.

If the DP area is unable to supply a project leader, should you settle for second choice? MRP concepts are not revolutionary by any means, but to take a hardened expedite-trained production person and expect him to embrace MRP may be a formidable task in itself. On the other hand, what you produce and how you produce it is no great mystery, and production does not differ drastically from other similar industries. An outsider, experienced and versed in MRP procedures, is more easily connected to a company's special manufacturing requirements than an expedite-trained production person is to MRP concepts.

The traditional practice has been to separate the position of MRP implementation project leader from the DP department. A great deal has been made of the fact that MRP implementation is a people project, not a computer project. The process of implementation is the same as installing an accounts payable or inventory system. User interface and input, description of the current procedures and paper flow, definition of system specifications and requirements and formulation of the standard operating procedure for new systems are all valid steps that a good DP manager follows when implementing any system.

DP personnel are no strangers to the development and implementation of new systems; MRP is just another new system. Your chances for success are enhanced by placing the responsibility for implementation leadership back into the hands of the implementation expert — the good DP manager.

Morello is MRP project manager for Perfect-Line Manufacturing Corp., a manufacturer of electrical products, located in Amityville, N.Y.

AMAPS
The Only Software
Your Manufacturing Company
Will Ever Need

AMAPS Gives You the Best of Both Worlds:
Superior Leading Edge Technology and Unbeatable User Benefits

AMAPS has been recognized in survey after survey as providing the most complete application functionality and highest system reliability. Our new technology utilizing state-of-the-art on-line architecture, with full support of Data Dictionary and 4th generation productivity tools, delivers the best to both users and data processing professionals.

Comserv offers AMAPS/3000 for minicomputers, AMAPS/Q for mainframes, and AMAPS/G for Government Contractors. Each of these systems offers true integration of Business Planning, Material and Production Planning and Control, and Financial Management with unsurpassed ease of use. All supported by the industry's most complete line of education products and experienced professional services.

Experience AMAPS yourself! Call to arrange for a demonstration.

Or to help in your software evaluation, attend one of our nationwide seminars which provides an in-depth review of the features, functions and architecture of our AMAPS products. Contact Lynn Johnson at 1-800-328-2030, or in Minnesota 1-612-881-7243.

comserv CORPORATION

LOOK INTO OUR MANUFACTURING CONTROL SOFTWARE.

YOU WILL FIND OVER 700 INSTALLATIONS ALREADY BENEFITING FROM IT.

Benefiting through reduced inventory costs, increased productivity and improved customer service.

MAS-Manufacturing, the closed loop Manufacturing Resource Planning System from Martin Marietta Data Systems, has been delivering key benefits like this to hundreds of companies around the world for over a decade.

YOU WILL FIND A FLEXIBLE SOFTWARE SYSTEM AND HARDWARE INDEPENDENCE.

MAS-Manufacturing is the fully integrated on-line Manufacturing Control System with the built-in flexibility to be used in a wide variety of manufacturing companies—both large and small. And since our system is made up of integrated modules, your company can implement them as your business or budget dictates. Without the overhead of installing functions not required.

MAS-Manufacturing delivers results by synchronizing the six most critical elements of your company's manufacturing operation:

- ☐ Master Production Scheduling
- ☐ Inventory Control
- ☐ Manufacturing or Shop Floor Control
- ☐ Purchasing
- ☐ Cost Control
- ☐ Engineering Control

And we're flexible when it comes to providing you with the hardware option that meets your requirements. MAS-Manufacturing operates on *a wide variety of computer systems* from IBM mainframes and 4300 series computers (including the 4321/SSX) to Hewlett-Packard 3000's and DEC VAX minicomputers. For use on your machine or we'll supply the hardware too.

You can even use MAS through our Remote Computing Service, avoiding any hardware investment or commitment. And, because of the hardware versatility of MAS-Manufacturing, the system can easily be brought in-house in the future.

MARTIN MARIETTA

YOU WILL FIND UNBEATABLE SUPPORT, TRAINING, AND DOCUMENTATION.

As with every Martin Marietta product, you and your company can rely on us for full support. Our manufacturing and data processing specialists are always ready to assist you throughout each step of the planning, installation and implementation.

You will also find us ready to address your needs for software customization and user training. We can provide you with full maintenance services—including a special Customer Service Hotline.

And to top it off, you will be pleased to find that our documentation is as comprehensive as you would expect from an industry leader.

YOU WILL DISCOVER A GROWING MAS FAMILY OF PRODUCTS.

We recognize that there is more to a manufacturing company than manufacturing control. To meet your company's complete needs, we offer a growing family of MAS products including:

- ☐ MAS-Manufacturing
- ☐ MAS-Personnel and Payroll
- ☐ MAS-Financials
- ☐ MAS-Project Management
- ☐ MAS-Decision Support

Not to mention the 100-plus software packages offered on our remote computing services network.

We plan to continue our efforts as your total information services company by adding even more quality products to our growing MAS family.

YOU WILL REALIZE THAT RESULTS ARE ONLY A COUPON AWAY.

Whatever your manufacturing control or information services requirements, we have a system which can give you tangible, bottom line benefits. Fill out the coupon and mail it—we'll send you complete details on how Martin Marietta Data Systems products can start paying off for your company right away. Or, better yet, call us toll-free at (800) 638-7080. In Maryland, (800) 492-7170.

I'D LIKE A CLOSER LOOK.

Send me more information on MAS-Manufacturing software. Also include details on:

- ☐ MAS-Personnel and Payroll
- ☐ MAS-Project Management
- ☐ MAS-Financials
- ☐ MAS-Decision Support

SPECIAL REPORT

Integration coming to shop floor automation

By Ray L. Dicesaré
Special to CW

There is a revolution catching fire in manufacturing. Automation that started on the shop floor is revitalizing American industry. It has included the various technologies of manufacturing resource planning (MRP), computer-aided design (CAD) and manufacturing, computer-aided engineering and robotics to boost productivity and profits.

But the movement toward high-technology solutions provided by DP personnel has not been restricted to shop floor tools and the managers of production. The revolution has now moved toward the functional integration of all these technologies. Functional integration will forever change the way business is conducted, enlisting everyone from the shop floor to the administrative floor, including the top decision makers.

The movement toward automated systems was inaugurated by the pressing needs of blue-collar managers for timely and accurate information to help them gain control of the production environment — of people, materials and equipment. Manufacturers found solutions in computer hardware and software. But the people involved soon realized that automating production on the shop floor sent reverberations of change all the way to the administrative floor. Management responsible for corporate finance, purchasing, engineering and marketing clamored for the same timely and accurate information.

While much of the information revolution taking place on the shop floor was of real value to other areas of the company, one very vital ingredient was lacking: There were no links, no bridges, to tie one area of a manufacturing company to another — marketing to order management, to engineering, to purchasing, to production, to finance and back again. What was needed was a functionally integrated solution.

While much of the information revolution taking place on the shop floor was of real value to other areas of the company, one very vital ingredient was lacking: There were no links, no bridges, to tie one area of a manufacturing company to another — marketing to order management, to engineering, to purchasing, to production, to finance and back again. What was needed was a functionally integrated solution.

Production management is most acutely concerned with planning for and controlling the resources required to produce a marketable finished product.

With all the changes wrought in the world market in the 1970s, manufacturers found themselves caught in a squeeze play. Inflation and high interest rates required that they cut inventory while increasing production efficiency. Changing consumer attitudes demanded quality, choice and service, while there was always pressure to maintain or reduce costs. Efficient, high-volume production runs had to be balanced against shorter runs for market flexibility.

MRP II gave production management the tools it needed both to plan and to control production within these constraints.

On the control side, manufacturing standards must be developed to define what goes into each product. Manufacturing standards also specify standard routings required to support the production process. Inventory control provides a means of tracking inventory from the receiving dock to the warehouse and through production. Shop floor control provides for dispatching and tracking work assignments systematically.

The planning side

On the planning side, the most important MRP II tools include master production scheduling, which is a formalized plan that tells production what, when and how much it is going to make. MRP and capacity requirements planning translate the master schedule into what materials and capacity are required to execute the plan.

All of these tools are, in themselves, important advances in the way production is managed and controlled. They produce significant cost savings by giving production management a better view of what is happening on the shop floor. They facilitate reductions in inventory levels as well as improved customer service. They give management the ability to anticipate material shortages as well as capacity bottlenecks, and they give marketing accurate information on what is available to promise.

But manufacturers began to appreciate the fact that these tools also supply information of great value to other corporate managers in the areas of finance, marketing, purchasing and engineering. Just as MRP II was the natural evolution of MRP, functional integration is the next step in providing the links and bridges tying the various pieces to a larger whole.

One of the most critical functional links takes place in the cooperative effort of production management and purchasing management to control inventories. MRP provides time-phased information on material needs, while master production scheduling increases the ability to forecast accurately production in the future.

Armed with this information, purchasing can greatly improve its performance and ability to ensure the best price and service from its suppliers. In turn, an integrated purchasing system that can record and track vendor performance serves the information needs of engineering in designing and specifying purchased parts.

Another critical functional link exists between the shop floor and financial management. Information gathered in inventory control and shop floor control is just as important to effective cost accounting as it is to shop management. The actual cost of material and labor activities can be analyzed using the cost of operations and materials defined in manufacturing standards as a benchmark. The resulting variances aid financial management in pinpointing out-of-control cost situations. This ensures that the information used to plan and control production is the same information used for cost accounting.

The axiom that knowledge is power is especially true when determining a competitive price that will return a sound profit. The pressures of the changing world market in the 1970s made it imperative that marketing have the best information available in setting prices. Marketers, in turn, were the first to become aware of shifting customer attitudes regarding buying trends. This information is crucial to forecasting and developing a workable master production schedule.

Information about what the customer likes and dislikes is extremely useful to engineering. Engineering can readily transfer that information into product design and tooling improvements as well as perform change simulations and consolidation with CAD. In an integrated system, CAD feeds that information directly into the bills of materials in manufacturing standards, which brings another information loop full circle.

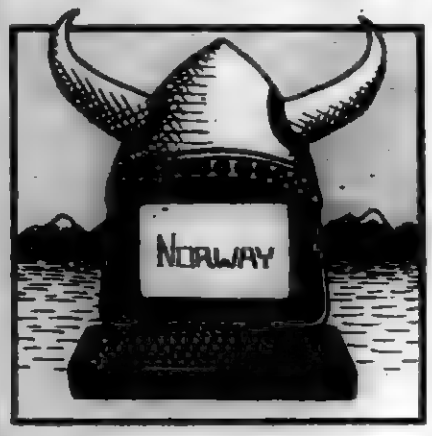
The functional link between marketing and the manufacturing plant is achieved with a formalized order processing system. Order processing marks the beginning and end point of manufacturing.

With an order processing system that is functionally integrated to an MRP II system, "on hand" and "available to promise" information can be relied upon. In a market increasingly tuned to service, this can spell the difference between a one-time buyer and a repeat customer.

The revolution that started on the shop floor has begun to come full circle. Functional integration is the thread that weaves the entire manufacturing process — from engineering, to material planning, to production, to marketing, to accounting — into one completely integrated fabric in which each of the different parts serves and supports the whole. It proves another axiom: The whole is always greater than the sum of its parts.

Dicesaré is vice-president of the Manufacturing System Division of Management Science America, Inc., a software vendor based in Atlanta.

The Norwegian computer market wants to hear from you.



The Norwegian computer market is expected to *grow* at an annual rate of 30%. The Scandinavian countries (Norway, Sweden and Denmark) constitute the fourth largest regional market in Western Europe, and according to International Data Corporation, it is a highly developed market.

Subject data bases: blueprint for shop

First of a two-part series

Subject data bases are the integrated, consolidated data bases that result from a rigorous data modeling effort. Subject data bases combine related data elements into a single data base, even when the elements come from vastly differing requirements. When an organization defines its subject data bases, there is no overlap between the data bases and, furthermore, all functions served by the shop are represented in the data bases.

In addition to reducing data redundancy, subject data bases also reduce process redundancy, since the fewer data definitions there are, the fewer programs need to be developed and maintained. A significant by-product of designing and implementing subject data bases is efficient development and greatly reduced maintenance work load.

Subject data bases that are produced as a result of a modeling exercise are, in essence, a blueprint for the data architecture for a shop. There is no question as to the usefulness of a well-constructed blueprint. Unintegrated systems do not lay a foundation on which future systems can build. Data and processes, in whole or in part, must be constantly recreated.

But it is not enough merely to create a blueprint. To be effective, the blueprint must be translated into tangible systems. This translation must be done carefully, because subject data bases lend themselves to some very real implementation problems.

The implementation of subject data bases must be tempered by the environment in which they will operate. Specifically, the on-line operational environment and the decision support environment are of relevance to the implementation of subject bases.

There are two primary considerations

See SUBJECT page 68

Introducing Olympic Games for computer programmers

By Phil Sokolowsky
Special to CW2

In this Olympic year, there is, unfortunately, a class of deprived citizens who cannot relate to the Olympics at all. These people are so mired in their own world that they rarely see daylight, let alone get any exercise. These unfortunates are known as programmers.

In an effort to get programmers interested in an exercise program that is compatible with their life-styles, the Winter Computer Programmers' Olympics has been created. Bear in mind that the events are geared toward a population whose only exercise is hitting a keyboard. The winter events include:

■ The kludge. Unlike the thrilling, 60-mph sport played by death-defying daredevils, this is a favorite of insecure programmers. The object of the game is to see how dense and unreadable a simple read/write program can be made. Points are scored for meaningless data names, dead code, unused files and so on. Any shred of documentation immediately disqualifies the contestant.

■ The 90-meter ski dump. There is no starting gun for this event. Instead, the player is awakened by a 5 a.m. phone call from the night officials and summoned to the operations room to fix an abend. The player must reach his destination within 30 minutes (including the obligatory stop at the local 7-11 for an extra-large black coffee and an 18-oz. bag of Frito's corn chips) in order to read the dump which, of course, has not yet been printed. In order to get a medal, the player must figure out the problem, rerun the job, burst and decollate the output by hand, shave in the company washroom and be at his desk ready for a full day's work by 8 a.m.

■ Structured figure skating. In order to qualify for this event, the contestant must first complete the grueling, two-hour Cross-Country Walkthrough. Those lucky enough to make it will be rewarded by the beauty and grace of the event. The player is judged by his peers for the design of his loops (no figure eights allowed here), for readability of his routines and for style and grace.

■ Systems bobsledding. This fast-paced, nerve-racking event is played primarily by those programmers currently seeking employment elsewhere. The gold goes to the programmer with the best explanation for why he is wearing a three-piece suit today when his normal attire is jeans and a T-shirt.

■ User-friendly hockey. All participating programmers are forced to join this event, because none of them wants to. Players are divided into two teams: programmers vs. users. Users attempt to stop programmers from employing DP jargon, while programmers try to convince users that the word "face" is actually a number.

But what of the summer programmer — that competitive breed that spends its summer vacations coding indoors? Just for the summer programmer, we present the Summer Computer Programmers' Olympics.

All the events listed are winter programmers' sports, meant to be played in an office building in which the heat has been shut off for at least 36 hours. Contestants are forced to wear winter clothing and mittens while competing at their terminals.

But what of the summer programmer — that competitive breed that spends its summer vacations coding indoors? Just for the summer programmer, we present the Summer Computer Programmers' Olympics, which include:

■ The discuss. A programmer begins this logic game by asking the analyst for which he is working, "Can I discuss with you the detailed programming specs you gave me on this cocktail napkin?" The object of the game is to ask as many pointed questions as possible within the two-minute time limit in order to prove that the analyst does not, in fact, know what he is talking about.

■ The hexadecathlon. This event is a must for the jack-of-all-trades type. Sixteen events, numbered 0 thru F, must be completed. The point is to find the programmer who is best at being all things to all people. Contestant activities include: writing business specs, because the user

American Software unveils system for IBM mainframes

ATLANTA — American Software, Inc. has announced its Accounts Receivable Management System for IBM mainframes. The software monitors a company's receivable assets.

The system is said to handle the requirements of open-item or trade receivables. It was designed to aid multidivision companies and has no limitation on the size or number of accounts it can handle, according to the vendor.

A credit data base provides customer history data for three six-month periods and includes pay habits, sales volumes, total credits, high credit, cost of late payments, history of unearned and excess discounts taken and total collections recovered, the vendor said.

The system prints nine types of invoices and notices using one form and interfaces with order-entry files for automatic credit checking, the vendor said.

The system was designed to operate in an OS environment on IBM's 370 and larger computers, the vendor said.

Prices range from $45,000 to $90,000, according to the vendor.

American Software is located at 443 E. Paces Ferry Road, Atlanta, Ga. 30305.

Intech development tool runs on IBM Personal Computer XT

CAMBRIDGE, Mass. — Index Technology Corp. (Intech) has introduced a software development tool that automates much of the analysis, design, organization and documentation procedures of systems analysis.

Excelerator runs on the IBM Personal Computer XT. It is an integrated, menu-driven package that utilizes graphics, a data dictionary and word processing to allow analysts to draw charts and diagrams and produce documentation. With the diagramming facilities, a user can design enterprise models, data flow diagrams, data structure charts, record and file layouts, screen definitions and report layouts, a spokesman said.

The product incorporates predefined templates and can automatically generate connections between objects. A link to Microsoft, Inc.'s Microsoft Word package allows narrative descriptions of systems design to be generated.

The integrated data dictionary stores objects, connections, text, data elements and records at the time of drawing. The dictionary holds all information about the system and its related graphs, the spokesman said. Up to 10 levels of graphs can be linked together in the dictionary for

McDonnell Douglas' Unigraphics II multiple island machining

McDonnell Douglas unveils graphics tool

ST. LOUIS — McDonnell Douglas Automation Co. (McAuto) has announced an advanced interactive graphics software system, which the vendor said was designed exclusively for 32-bit processors.

Unigraphics II is said to be a tool for design and manufacturing engineers, draftsmen and detailers and can be used in product development, including engineering design and analysis, drafting and the generation of numerical-control data.

Unigraphics II has an associative data base that permits the user to establish and manipulate links among information to help automate design, drafting and manufacturing, a spokeswoman said. Functions automated by Unigraphics II include the dimensioning of drawings and the development of programs to machine complex product geometries.

The Unigraphics II system is designed to run on 32-bit minicomputers, such as the Digital Equipment Corp. PDP-11 under the RSX-11/M operating system, the VAX-11 under VMS and the Data General Corp. Eclipse and Eclipse MV series processors under AOS and AOS/VS.

The spokeswoman said the end product of a design developed with Unigraphics II is a three-dimensional model of a part, with all descriptive data stored in the data base. The data base is a common source of information for drawings and documentation, engineering analysis and numerical-control instructions for manufacturing and permits integration of computer-aided design and manufacturing and computer-aided engineering uses. Unigraphics II can also be interfaced with McAuto's robotics modeling and programming products.

The Unigraphics II system is priced between $40,000 and $60,000, depending on the host system, from McAuto, St. Louis, Mo. 63166.

Hitachi joins Fujitsu, IBM, releases 31-bit address mode

By Kaoru Sumada
Special to CW‡

TOKYO — Hitachi, Ltd. recently unveiled a 31-bit addressing mode that can be expanded to a virtual memory of 2G bytes. The system is IBM-compatible and runs on Hitachi's M-280 and M-260 processors under its VOS/ES 1 operating system. Hitachi's entry into the 31-bit addressing arena was preceded by both IBM and Fujitsu, Ltd., which have already introduced 31-bit products.

Why did Hitachi hurry to the marketplace? Hitachi maintains that "the increase in the volume of user application programs and the development of more complex programs have created a need for memory exceeding 16M bytes."

The 31-bit Hitachi system can switch back and forth between 24-bit and 31-bit addressing. In addition, operating systems exceeding 16M bytes can be relocated to the increased memory of 31-bit addressing, thus creating room for more files and terminals, according to the vendor.

Users considering the third stage of on-line system implementation appear to be interested in the 31-bit technology. Particularly appealing is the increased number of terminals it supports. Others feel the price is too high, with relatively minor merits.

Costs for M-280 and M-260 field-upgrade kits start at about $3,100, Hitachi said. The upgraded operating system is VOS 3/ES 1, an enhanced version of VOS 3, with its portions exceeding 16M bytes relocated to virtual memory.

There are two versions of VOS 3/ES 1. VOS 3/ES 1-JSS 3 supports the I/O functionality under a single processor, and another version (VOS 3/ES 1-JSS 4) supports the same under a multiprocessor system.

Hitachi's operating system VOS 3/ES 1 corresponds to IBM's MVS/SP version 2 and Fujitsu's OSIV/F4.MSP. IBM supports assembler and VS Fortran, released in April, and plans to support all of its other mainframe software on 31 bit.

Currently, IBM Japan is said to be developing a 31-bit version of Cobol and PL/I.

Fujitsu's product supports Fortran 77. Cobol is under development, but Fujitsu has no plans to develop an assembler. Hitachi supports only Ofort77/EA (Optimizing Fortran77/Extended Addressing).

The Hitachi mainframe's VOS 3 operating system consists of VOS 3/SPO, VOS 3/SP1, VOS 3/SP2 and the new 31-bit operating system, VOS 3/ES 1.

However, as the VOS 3 OS series was a subject of IBM's copyright violation lawsuit against Hitachi, Hitachi does not have the full rights to this software.

Therefore, SP2 users must deal directly with IBM, or else Hitachi can rewrite the entire operating system software.

For SP1 users, Hitachi will partially rewrite the program so that it does not infringe on IBM's rights.

Sumada is a staff writer for Computerworld Japan, *a sister publication of* Computerworld *in which this story originally appeared. The article was made available to* Computerworld *via the CW International News Network.*

Here are a few good reasons why you should make Local Data your protocol converter company.

Local Data's comprehensive line of local and remote protocol converters have been used around the world to make async-to-IBM communications simple and economical.

DATALYNX™/3274.
DataLynx™/3274 remote async ASCII protocol converter supports SNA/SDLC or BSC protocols. 80 types of ASCII async terminals can emulate IBM 3278 display stations. RS-232C ASCII async printers can emulate IBM 328X printers.

DATALYNX™/3780.
DataLynx™/3780 async ASCII-to-IBM 5780, 2780, 2770 and 3741 protocol converter supports EBCDIC BSC protocol on one channel and async ASCII devices on the other two channels. Features include transparency, mini/micro support and free file transfer program.

INTERLYNX™/3278.
InterLynx™/3278 allows the attachment of low-cost ASCII CRT terminals or p.c.'s to 3274/3276/4701 and 43XX integrated adaptor Type "A" coax ports. InterLynx/3278 enables the user to use async CRT's on IBM systems and switch to async applications under terminal control.

FILELYNX™/3278.
For micro-mainframe file transfers.

INTERLYNX™/3287.
InterLynx™/3287 allows attachment of ASCII printers to IBM Type "A" coax ports or 3274/3276/4701 controller and 4321/4331 CPU's.
SNA LU1 SCS and LU3 capability are standard with the InterLynx/3287. Features include parallel and serial ports and front panel set-up.
For more information call today.

SYSTEMS SOFTWARE

THE BRIDGE, INC.
Keyplus

The Bridge, Inc. has announced Keyplus, said to be an on-line, high-speed data entry system for IBM's DOS/VSE and MVS operating systems.

A spokesman said Keyplus achieves high-speed response by working directly with IBM's Vtam. All data is said to be automatically checked at input, and mistakes are highlighted so they can be changed during the initial input session. Keyplus reportedly can also work as a front-end system to run existing batch programs on-line.

Keyplus reportedly can be used to paint screen formats interactively, control data entry and verify data. It is said to provide supervisory facilities. It works with Vtam, and its files use IBM's Vsam or Bdam. Keyplus uses standard operating system JCL and libraries. The Keyplus system also reportedly features access security, message broadcasting and backup and recovery facilities.

Keyplus licenses for $15,500 for DOS/VSE and $19,500 for MVS.

The Bridge, 199 California Drive, Millbrae, Calif. 94030.

DATA TRANSFORMATION, INC.
Cruise/38 Release 3.0

Data Transformation, Inc. has announced Release 3.0 of its Cruise/38 job scheduler system for the IBM System/38.

Among the announced enhancements to Cruise/38, the vendor said the system will now support the entire 512-byte local data area for passing parameters and will allow a job to store its current local data area upon completion to be used by another job scheduled later. In addition, users can now specify an override execution priority for jobs being scheduled by Cruise/38.

The vendor said extensive holiday support allows the user to tell the system that certain days are holidays and what action the system is to take in the event that a job schedule falls on a holiday. A new frequency has been added for scheduling a job to run every "xx," or user-specified number of days. Also, Cruise/38 maintains a more comprehensive job history, and it allows for a job-group name to identify the job.

Cruise/38 is priced at $495 until July 1, when the price will increase to $605.

Data Transformation, P.O. Box 1541, Cape Girardeau, Mo. 63701.

See SYSTEMS page 62

Integrated application module announced

Integral Systems, Inc. has announced the Advanced Data Security system for users of its human resource software.

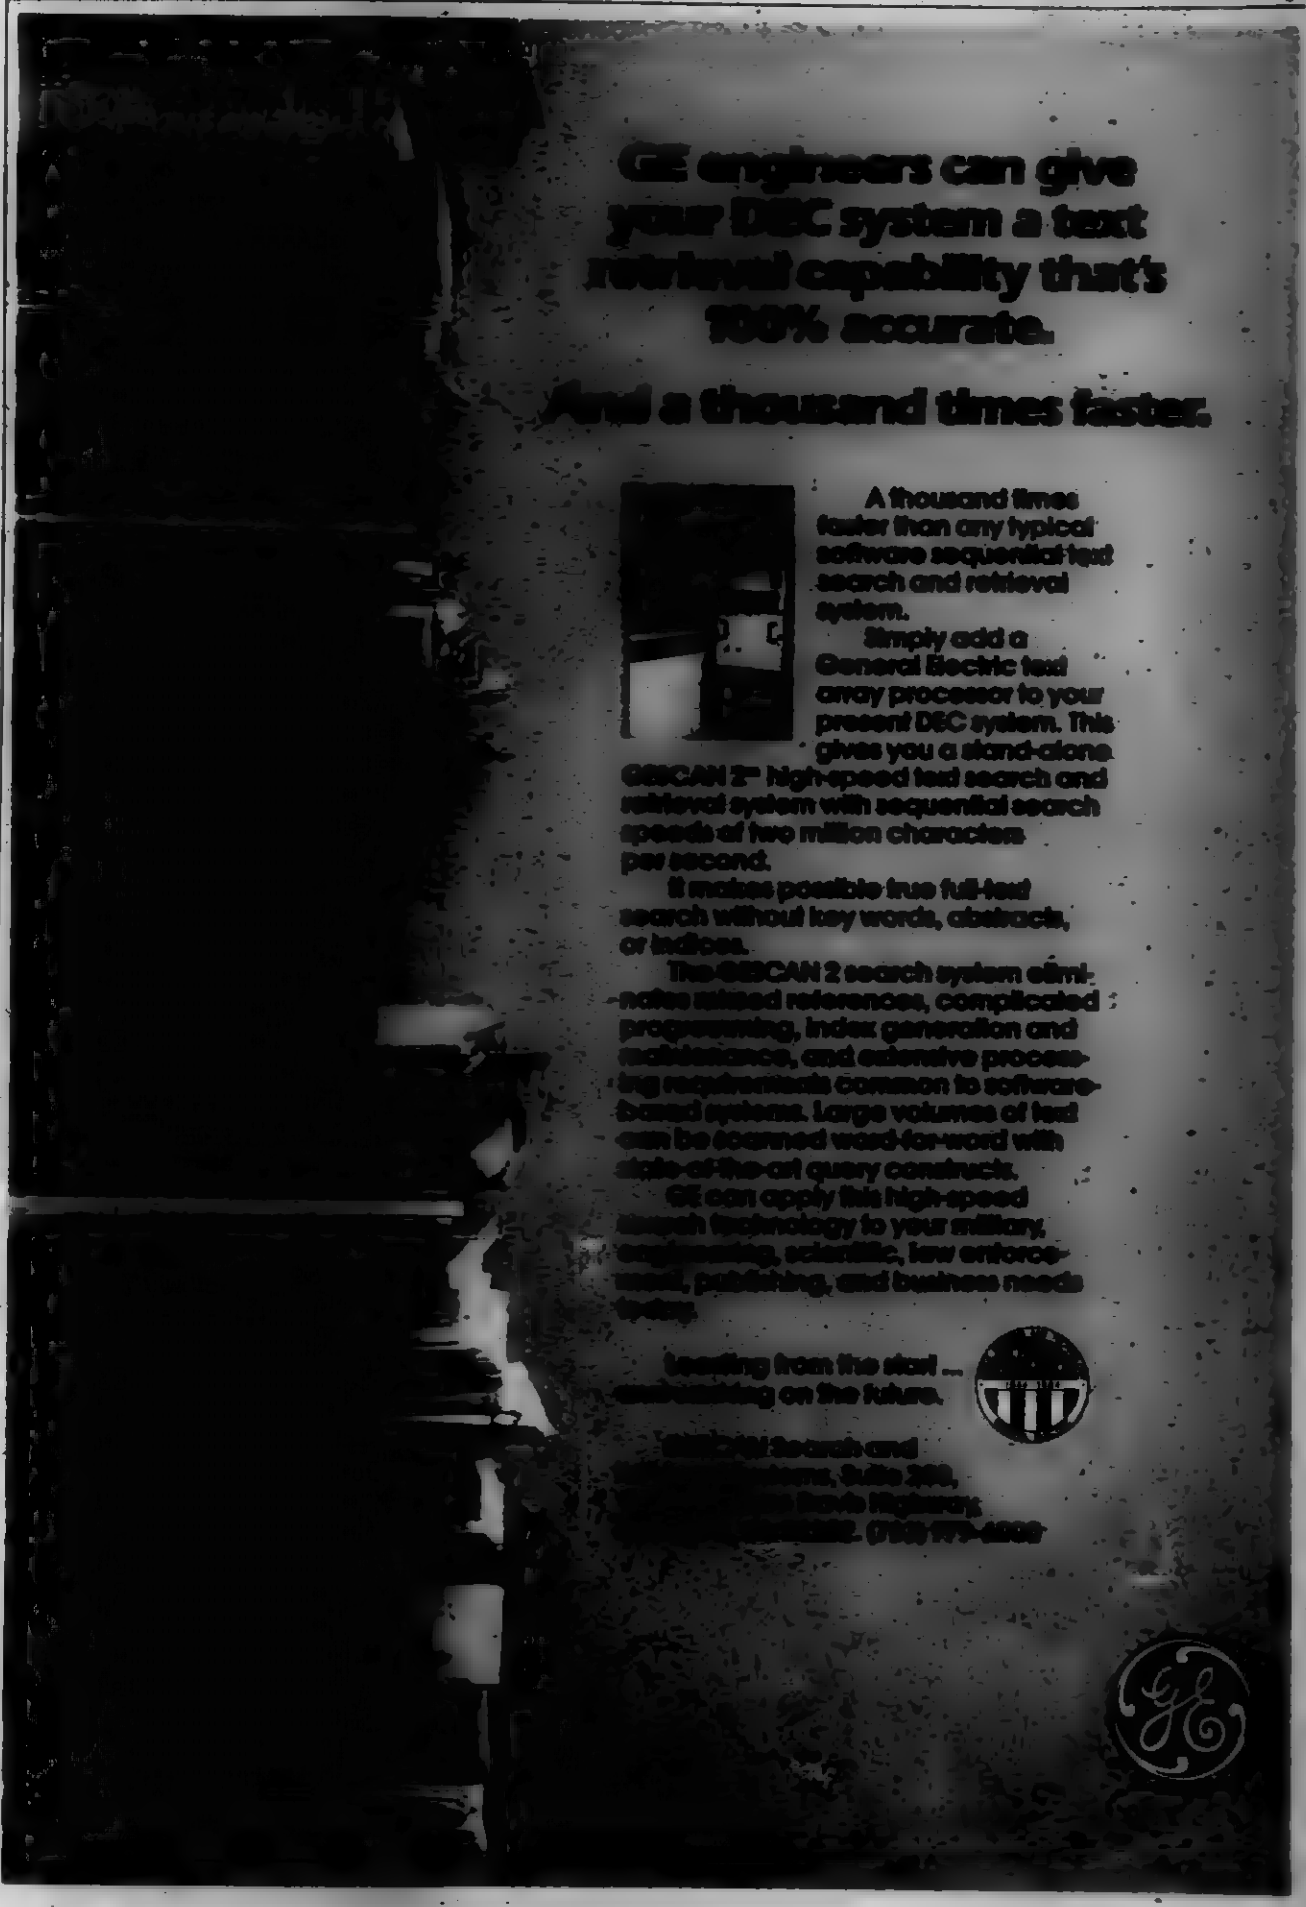
According to the vendor, the Advanced Data Security system is an integrated application module for Integral Systems' Payroll and Personnel System. The software uses Cullinet Software, Inc.'s IDMS data base management system on IBM mainframes.

The vendor said Advanced Data Security is a real-time system that can be tailored. The system was developed using Cullinet's ADS/On-line, with all screens, programs and work records residing in Cullinet's Integrated Data Dictionary, the spokesman said.

The system is said to offer dynamic checks that can restrict operator access to records of selected units, as well as employee types and data elements, on either a mandatory or a conditional (range) basis.

The Advanced Data Security system is included as a module in the Payroll and Personnel System, which is priced between $30,000 and $100,000, depending on the host environment and the modules selected, according to the vendor.

Integral Systems is at 165 Lennon Lane, Walnut Creek, Calif. 94598.



SOFTWARE & SERVICES

SYSTEMS from page 61

B. I. MOYLE ASSOCIATES, INC.
Bimedit; Release 4.0 of Bimspool

B. I. Moyle Associates, Inc. has announced its Bimedit system in conjunction with the introduction of Release 4.0 of its Bimspool program product.

Release 4.0 of Bimspool, which is designed to spool job listings in IBM's DOS/VSE power spooling queue to 3270 terminal printers under CICS, includes a variety of enhancements, including the ability to generate messages in French.

Bimedit is a program editor which has also been designed to generate messages in French. Both Release 4.0 of Bimspool and Bimedit are priced for $4,000 or can be leased annually for $2,000.

B. I. Moyle Associates, 5788 Lincoln Drive, Minneapolis, Minn. 55436.

NETWORK CONCEPTS, INC.
Release 6 of Control

Network Concepts, Inc. has announced Release 6 of its Control source management and library system for the entire series of Tandem Computers, Inc. processors.

According to the vendor, Release 6 of Control features added total network support and a relational data base directory. The new release is said to provide a secure method of allowing remote programmers to share common libraries of software.

In addition, Release 6 features a cross-reference capability, enabling Control to determine where any source file is being used. The directory allows any user on the network to search for programs with Tandem's standard query language.

Release 6 of Control is available for a one-time license fee of $9,600.

Network Concepts, Two Ridgedale Ave., Cedar Knolls, N.J. 07927.

PARK SOFTWARE, INC.
BIO

Park Software, Inc. has announced BIO, a software product that enables the migration of programs written for Digital Equipment Corp.'s RSTS/E operating system to DEC's VMS system running on the VAX-11 series of computers.

BIO allows RSTS-based application software written in Basic or Basic Plus 2 to be transported to VAX/VMS without converting the files and without major programming logic conversions, a spokesman said. This is accomplished by providing a series of external, callable routines designed to emulate the RSTS/E disk file I/O environment.

Depending on the CPU environment, prices for the product range from $500 to $3,000.

Park Software, P.O. Box 202 Northgate Station, Seattle, Wash. 98125.

HONEYWELL, INC.
TDC 3000 facilities

Honeywell, Inc. has introduced two software facilities that enable its TDC 3000 process management system to communicate with IBM's 4300 series of computers. The facilities include a Binary Synchronous Communications channel link and the ability to transfer files to 4300 hosts using IBM's Systems Network Architecture protocols.

According to the vendor, the facilities make it possible for the real-time process information acquired by TDC 3000 to be transmitted directly to an IBM 4300 for further manipulation and reporting.

The price of TDC 3000 process management systems starts at $100,000.

Honeywell, 16404 N. Black Canyon Highway, Phoenix, Ariz. 85023.

QUALITY MICRO SYSTEMS, INC.
Lasergrafix 1200 Version 2

Quality Micro Systems, Inc. has introduced Version 2 of the operating system software for its Lasergrafix 1200 electronic printer.

The latest version reportedly offers new features, including improved emulation with the Diablo Systems, Inc. Model 630 daisywheel printer; business graphics commands for automatic bar and pie chart generation; improved compatibility with Tektronix, Inc. 4010/4014 terminal plotting; new type fonts; arc and circle drawing commands; flood-fill command; and automatic page overlay, according to a vendor spokesman.

Current owners of the Lasergrafix 1200 will receive the Version 2 software at no charge, the spokesman said.

New owners of the printer, which costs $24,995, will receive the software at no additional charge, according to the vendor.

Quality Micro Systems, P.O. Box 81250, Mobile, Ala. 36689.

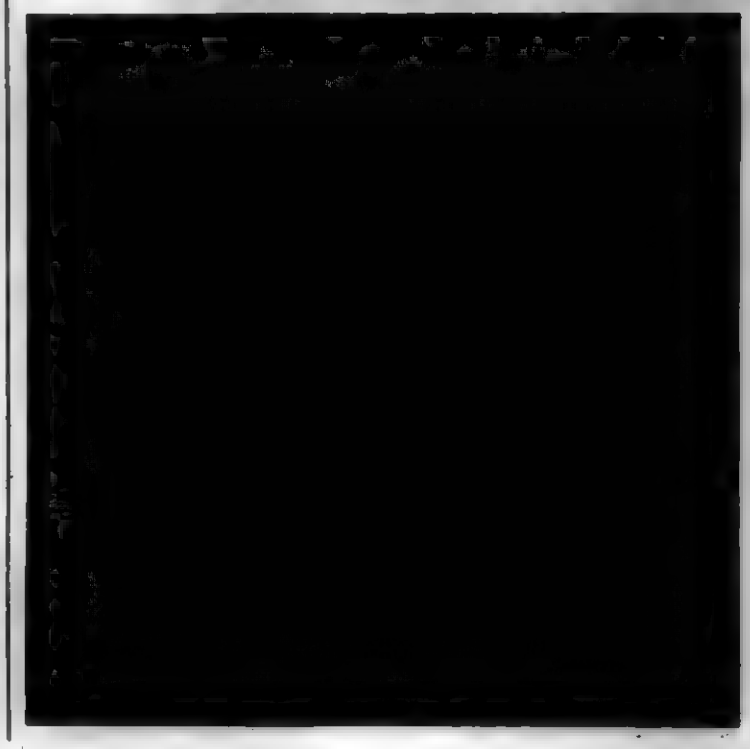
MICROTEC RESEARCH, INC.
Microtec ASM186; INT186

Microtec Research, Inc. has announced the Microtec ASM186 cross-assembler system and the INT186 interactive simulator.

According to the vendor, the Microtec ASM186 cross-assembler system is a Microtec Research implementation of the structured assembly language specified by Intel Corp. for the Intel 8086/8088 and 80186/80188 microprocessors.

ASM186 is used to assemble and link/load programs on a general-purpose host computer, then download those programs for execution on one of the above microprocessors, the vendor said.

INT186 is an interactive simulator for the Intel 8086/8088 and 80186/



Whether you're looking for Payroll, Personnel, Pension Administration or Claims Processing software, Information Science's "Whole Person" software gives you a comprehensive system that provides superior technical features.

Systems for both Database and Non-Database

InSci's state-of-the-art payroll/personnel database system is integrated into a number of database management environments–including IMS, DL-I, and IDMS. Native mode, the system is designed to take full advantage of each specific database structure, eliminating clumsy, resource-draining interface programs.

In addition, InSci offers two non-database systems. One using a sequential file structure, the other using a VSAM access method.

Pension

INSCI INT

"WHOLE PERSON" SOFTWA

SYSTEM THAT MEETS AL

PROFES

Introducing On-line PAS

PAS–InSci's new Pension Administration System–is available as a complement to our payroll/personnel package or as an independent, stand-alone system. PAS automates most aspects of pension administration from ERISA reporting and compliance to benefits calculation, retirement counseling, vesting schedules and benefits statements.

Software for Health Insurance Claims

Our health insurance claims processing system permits your organization to self-administer group health, dental, and disability claims–providing significant cost savings while achieving fast, accurate claims turnaround.

The Complete Human Resource Package

We call it "Whole Person" software because it is the most comprehensive, technically advanced set of human resource systems avail-

SOFTWARE & SERVICES

80186 microprocessors. It executes the object modules of the target microprocessor in the controlled environment of the host development system, permitting the user to debug software.

Operating in an interactive or batch mode, INT186 performs interpretive execution of the object modules of the Intel microprocessors by implementing, in software, the registers and logic control functions of the processors.

The vendor said both INT186 and ASM186 will operate on most general-purpose computer systems, including 16-bit minicomputers. The Microtec ASM186 cross-assembler system costs $2,200 without librarian and $2,500 with librarian. The INT186 interactive simulator is priced at $1,400.

Microtec Research, Suite 335, 505 West Olive, P.O. Box 60337, Sunnyvale, Calif. 94088.

NOVELL, INC.
Netware/EMS

Novell, Inc. has announced the addition of an electronic mail system to its Netware operating system software.

A spokeswoman said the Netware/Electronic Mail System (EMS) assigns a mailbox to every user in a local-area network utilizing the Netware operating system to provide its file server capabilities.

Mail can be sent to an individual user in the network, and mailings can be made to designated groups of users or to an intersection of multiple groups, the vendor said.

User input to Netware/EMS is said to be received by a command interpreter, which allows flexibility in command entry. An EMS mail security feature ensures access by assigned users only, and an express mail feature immediately informs a user of urgent communications.

Novell's Netware operating system currently works in conjunction with several local-area networks, including Corvus Systems, Inc.'s Omninet; 3Com Corp.'s Etherlink; Gateway Communications, Inc.'s G-Net; and Proteon Associates, Inc.'s Pronet.

The Netware/EMS system is priced at $795, and the Netware operating system is priced at $1,495, according to the vendor.

Novell, 1170 N. Industrial Park Drive, Orem, Utah 84057.

PRODUCTIVITY AIDS

INTERNATIONAL LOGIC CORP.
F-Scan

International Logic Corp. has announced the availability of its F-Scan Fortran source code analyzer for IBM CMS and MVS users.

A spokesman said F-Scan operates on either Fortran IV or Fortran 77 source programs and produces reports on program structure, parameter correspondence, common usage and file usage. In addition, a precise static analysis is produced on the program interfaces.

F-Scan can be used as a debugging aid in program development, in performing analyses prior to conversion, in planning for program maintenance and for expediting changes to existing programs, a spokesman said. Consistent analysis is produced for all Fortran packages, including packages developed by previous staff or outside sources.

A perpetual license for F-Scan is priced at $4,950. Other versions of F-Scan are available for Digital Equipment Corp. VAX-11, Data General Corp.'s Eclipse and Prime Computer, Inc. processors.

International Logic, Suite 500, 22 Battery St., San Francisco, Calif. 94111.

DATA GENERAL CORP.
Screen Generator Utility enhancement

Data General Corp. announced that it has enhanced its Screen Generator Utility software to interface with five additional languages: APL, C, Fortran 77, Pascal and PL/1.

The Screen Generator Utility is an aid that is said to reduce development and maintenance time for applications requiring screen management. The software operates on DG's Eclipse minicomputer systems with DG's AOS or AOS/VS operating system and on the Desktop Generation System microcomputers with the AOS/WS operating system.

Current users of the vendor's software will receive the upgraded version at no additional cost. The first-year license fee for the Screen Generator Utility under AOS/VS is $3,000, with subsequent years costing $1,800. The first-year license fee for systems operating under AOS is $1,500, with subsequent years priced at $1,000.

DG, 4400 Computer Drive, Westboro, Mass. 01581.

COMPUTING CAPABILITIES CORP.
Insight, Autopilot enhancements

Computing Capabilities Corp. has announced enhancements of its Insight and Autopilot applications development tools. The enhancement makes both compatible with the Hewlett-Packard Co. Dictionary/3000 data dictionary.

Insight reportedly allows users to implement on-line applications without programming, while Autopilot is said to create the Vplus forms automatically. Vplus is HP's terminal handler.

Insight can be licensed for $8,500 and Autopilot for $1,700.

Computing Capabilities, Suite 223, 465-B Fairchild Drive, Mountain View, Calif. 94043.

See MISC page 94

able. InSci started the HRS industry back in 1965, and we've led the field ever since. Our technical experts have provided you features unmatched by any other company.

Modularized Design For Easy Maintenance. InSci "Whole Person" software was designed from the top down and is highly modularized, providing maximum flexibility. A single module or subroutine supports each specific function in the system.

User Exit Routines. Strategic areas built into the InSci system allow exits to override the standard system routines. This means you can add your own programs without changing database system codes. InSci also gives you source codes so you can go into the system directly if you desire and still receive maintenance.

Preliminary or final processing mode. InSci systems let you select the most efficient operating mode for each processing task. All changes can be processed in real-time, so they become effective immediately. Preliminary processing allows for simulating situations such as a payroll run without affecting the database. And, of course, InSci systems provide state-of-the-art security precautions, complete maintenance support and training.

STERLING SOFTWARE MARKETING
Comparex Release 4.4

Sterling Software Marketing has introduced Release 4.4 of Comparex, said to be a productivity tool for programmer/analysts, data base administrators, auditors and quality assurance staffs.

According to the vendor, features of the new release include expanded reporting and interleaving, with more than 1,000 print variations to custom-tailor report output.

Comparex runs on any IBM 360 or larger mainframe under IBM's DOS, OS or VM operating systems.

Pricing for Comparex is $8,000 for the OS version and $4,000 for the DOS version. The VM/CMS version is available for $2,000 when purchased in conjunction with a DOS or OS system before May 1.

Sterling Software Marketing, 1007 Seventh St., Sacramento, Calif. 95814.

APPLICATION PACKAGES

MCBA, INC.
VAX Cobol packages

MCBA, Inc. has announced its series of VAX Cobol software packages for use with Digital Equipment Corp.'s VAX-11 series of superminicomputers.

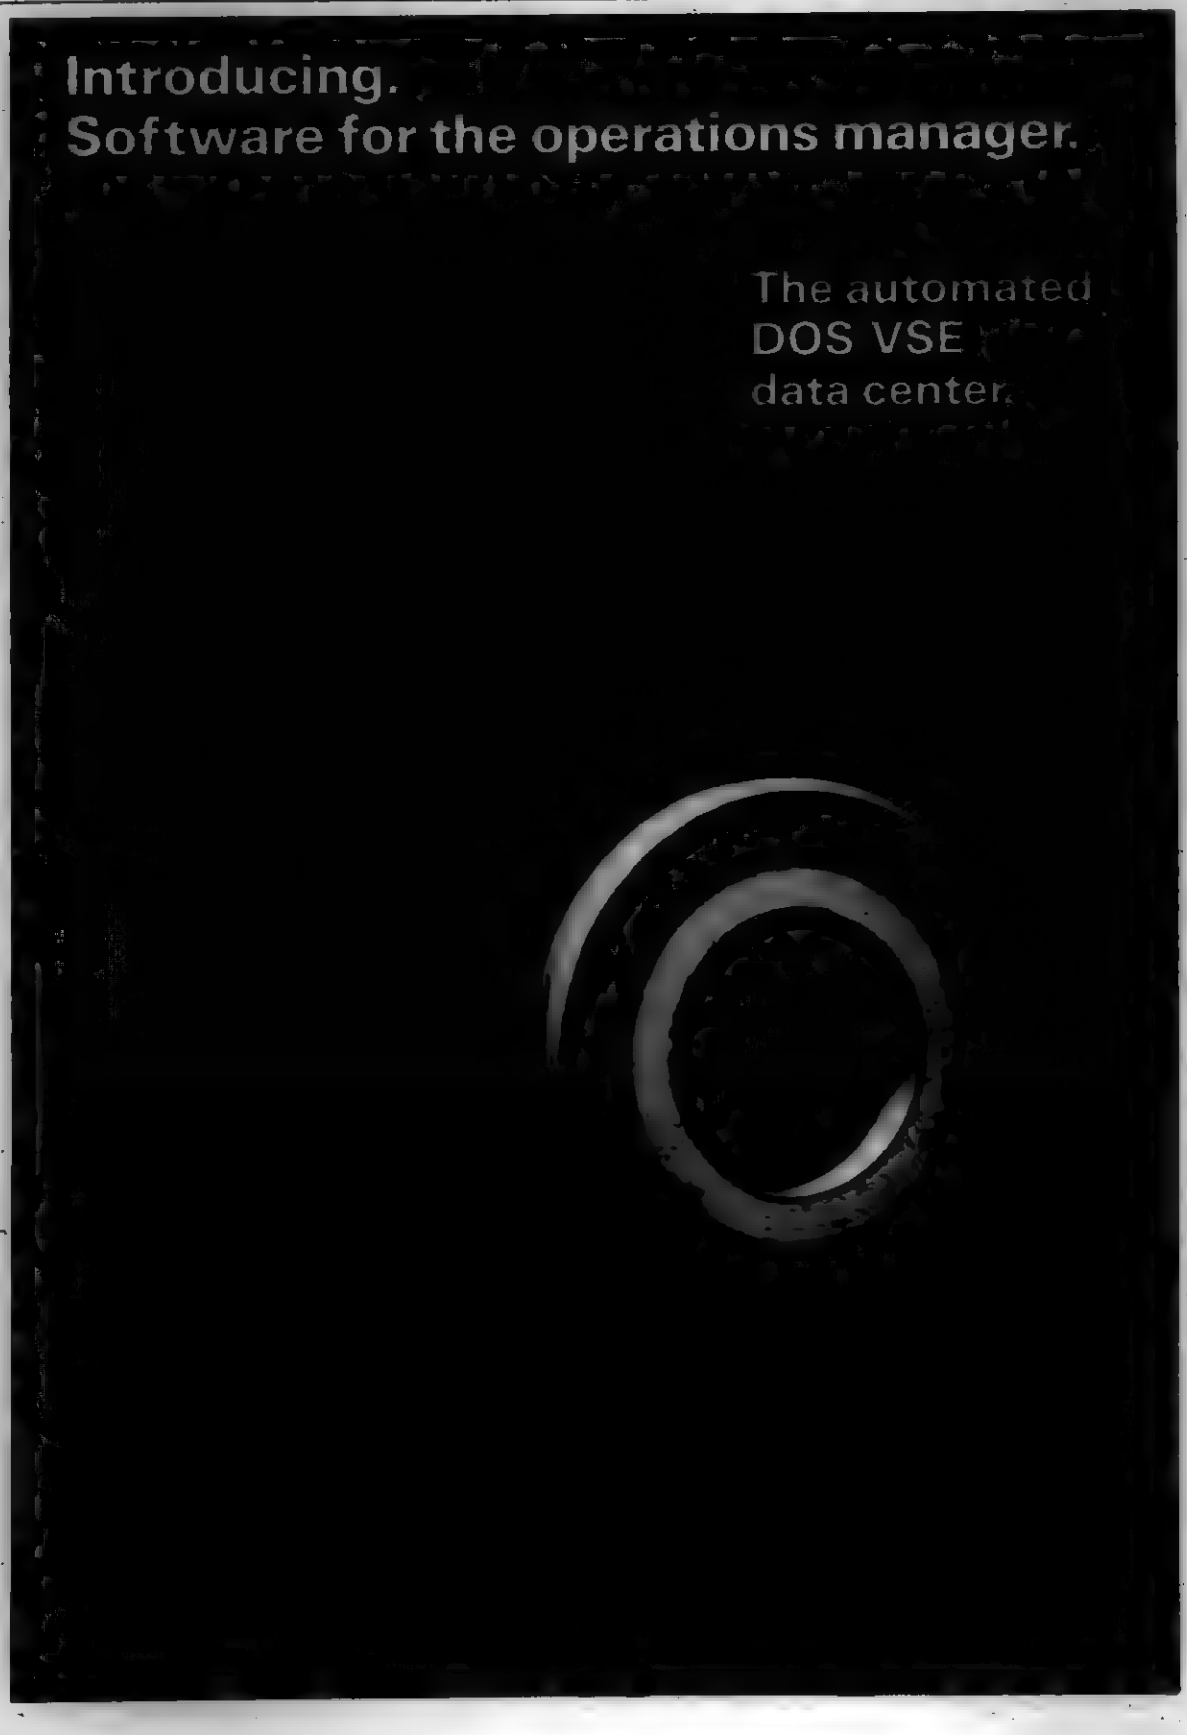
A spokeswoman said the VAX Cobol packages currently available are accounts payable, general ledger and payroll.

MCBA will also release other VAX Cobol packages, including accounts receivable, customer order processing, inventory management and purchase order and receiving. No availability date was announced.

The spokeswoman said the seven modular, interfacing packages have been designed to work together in a variety of combinations. They are also optimized for DEC's VAX/VMS operating system.

Source code licenses for MCBA's VAX Cobol packages range from $4,000 to $6,000, according to the vendor.

MCBA, 2441 Honolulu Ave., Montrose, Calif. 91020.



HONEYWELL, INC.
Business, accounting aids for DPS 6

Honeywell, Inc. has announced the availability of eight modular, interactive general business and accounting applications for use on its DPS 6 family of small business systems.

The applications were licensed to Honeywell from the developer, MCBA, Inc., and have been converted to make them compatible with Honeywell's Gcos 6 operating system. The eight modules may be used separately or in combination to form an integrated package. They are: order processing, accounts receivable, accounts payable, inventory management, bill of materials processor, general ledger, payroll and mailing list.

A Honeywell spokesman said the software is written in Ansi Cobol and uses structured coding to simplify modification. Other features include system integration for faster processing, extensive analysis and reporting capabilities, screen menus and prompts and audit trails.

The initial primary license fee for all eight modules is $15,500. Each individual package is priced at $3,000.

Honeywell, 200 Smith St., Waltham, Mass. 02154.

UNICAD, INC.
Romulus-E

Unicad, Inc. has introduced a solids modeler for use in computer-aided design (CAD) applications.

Romulus-E is said to be an enhancement of the Romulus solids modeler from Shape Data Ltd. Romulus-E combines the geometric definition and manipulation capabilities of Romulus with portions of a "universal CAD system" that the vendor is now developing, a vendor spokesman said.

The software is said to include such features as accurate boundary-file modeling of solids with tweaking, full lifting and sweeping, blending of edges and Boolean operations; symbolic command language with design-shop-type terminology; choice of the preferred interaction technique; wire-frame modeling capability; and rendering, viewing and windowing capabilities.

Romulus-E is said to run on a variety of systems, including Apollo Computer, Inc. DN300 and DN600 intelligent workstations, Digital Equipment Corp. VAX-11 series superminis and IBM 4300 series mainframes, the spokesman said. Prices range from $40,000 for intelligent workstations to more than $125,000 for mainframes.

Unicad, 1695 38th St., Boulder, Colo. 80301.

MCBA, INC.
HP General Ledger Release 2

MCBA, Inc. has announced Release 2 of its HP General Ledger package written in Cobol II for users of Hewlett Packard Co.'s Image data base management system on HP 3000 processors.

A spokesman said the enhanced HP General Ledger package has full multicompany capabilities and an expanded user-defined general ledger account number allowing up to 24 characters in as many as five levels. The system also allows the user to define financial entities interactively.

Other enhancements to the release include streamlined maintenance of financial statement formats, allow-

SOFTWARE & SERVICES

ing groups of accounts to be specified by ranges with the option to print summary or detail, the vendor said. Entry of general journal transactions is said to be speeded by allowing many fields to default to standard or previously entered values.

A source code license for Release 2 of the HP General Ledger package is priced between $3,000 and $6,000, depending on the HP 3000 model.

MCBA, 2441 Honolulu Ave., Montrose, Calif. 91020.

BAKER SOFTWARE PRODUCTS CORP.
Custom Printers Management System; Custom EDP Printers System

Two software packages, one for the graphics arts industry and the other for manufacturers of data processing labels, have been introduced by Baker Software Products Corp. Both products run on Wang Laboratories, Inc.'s OIS minicomputers.

The Custom Printers Management System, for the graphics arts industry, consists of modules for job costing, timekeeping, inventory control and print job estimating.

The Custom EDP Printers System consists of modules on prospective customers, customer data base management and history, inventory management, accounts receivable, job costing and end-of-month management analysis.

A minimum of 30 programs are contained in the label manufacturers package, which is available for $4,000 to $10,000, according to the vendor.

The graphics arts industry package is available for $14,000 to $24,000.

Baker Software Products, P.O. Box 55062, Indianapolis, Ind. 46205.

SOFTWARE EXTRAORDINAIRE, INC.
Word Processing Analysis System Release 2.0; Job Accounting and Control System Release 1.17

Software Extraordinaire, Inc. has announced new releases of its Word Processing Analysis System and its Job Accounting and Control System, both of which are designed for use with the Wang Laboratories, Inc. VS series.

Release 2.0 of the Word Processing Analysis System is said to be transparent to the word processing operator.

Release 1.17 of the Job Accounting and Control System is said to feature an audit trail of user activity, to report unauthorized logon attempts and to automatically log off users after a specified period of inactivity. It also reportedly has improved menu-building features.

The Word Processing Analysis System has an annual rental fee of $750 and a purchase price of $2,700, a Software Extraordinaire spokesman said.

The Job Accounting and Control System is priced at $1,500 per year for lease and $5,500 for purchase, according to the vendor.

Software Extraordinaire, 1507A Queen Anne Ave. N., Seattle, Wash. 98109.

COMSHARE, INC.
Additions to Profiles/3000

Comshare, Inc. has announced the addition of a report writer and a salary projection module to its Profiles/3000 personnel record-keeping and reporting system for Hewlett-Packard Co. HP 3000 series processors.

A spokeswoman said the report writer is an addition to Profiles/3000's current report writer and its existing reporting capabilities. The added report writer is said to give human resource management users additional flexibility in tailoring reports to meet personnel reporting requirements.

The salary projection module is said to be an analytical modeling tool designed for salary planning. It can be used to determine merit budgets or to allocate a salary budget according to pay-increase guidelines.

Profiles/3000, including the new report writer and salary projection module, is priced at $25,500 for a basic license.

Comshare, 3001 S. State St., Ann Arbor, Mich. 48106.

FARGO ELECTRONIC SERVICES, INC.
Fargo Business Software Series

Fargo Electronic Services, Inc. has announced the Fargo Business Software Series for users of Digital Equipment Corp.'s VAX-11 processors under the Unix operating system.

Seven program modules are available: general ledger, accounts payable, accounts receivable, job cost accounting, inventory control, mailing list management and sales lead processing and tracking.

A spokesman said the program modules are menu-driven and interactive. Information from one program automatically updates other modules that share the same data.

The series is written in C and is supplied with source code and documentation. The accounts payable and receivable modules are priced at $5,000, the inventory control and job cost accounting modules at $4,000, the general ledger and sales lead processing and tracking modules at $3,000 and the mailing list management module at $1,000.

Fargo Electronic Services, 7150 Shady Oak Road, Eden Prairie, Minn. 55344.

REDWOOD SOFTWARE, INC.
Manex

Redwood Software, Inc. has announced the Manufacturing Execution (Manex) system, which the vendor said operates on the entire series of Tandem Computers, Inc. and Stratus Computer, Inc. processors.

According to the vendor, the Manex system is a decision support tool designed to help production supervisors and workers monitor and control the manufacturing process by identifying problems as they arise.

The Manex system is priced between $100,000 and $250,000.

Redwood Software, 3960 Freedom Circle, Santa Clara, Calif. 95050.

SOFTWARE & SERVICES

TOOLS from page 65

MASSCOMP
Spice 2

Masscomp has added Spice 2, a circuit-simulation software package, to its MC-500 and Workstation 500 computer systems.

Spice 2 is general-purpose circuit-simulation program for monitoring dc, nonlinear transient and linear transient ac analysis, according to the vendor. The program is available free of charge.

Masscomp, One Technology Park, Westford, Mass. 01886.

DATA BASE MANAGEMENT SERVICES

MICHAELS, ROSS & COLE, LTD.
MRC-Manager 2.0

Michaels, Ross & Cole, Ltd. has announced release 2.0 of MRC-Manager, a relational data base management system (DBMS) for users of the IBM System/38.

According to the vendor, the product allows users to create on-line inquiries, reports and bar graphs of the information available on the IBM System/38.

The MRC-Manager 2.0 DBMS reportedly features help key documentation, menu-driven multilevel security, multifile retrievals, relational file joining, single or multimember file capacity and unlimited sequencing and total levels.

MRC-Manager licenses for $1,140 per CPU. Multisite pricing and worldwide licenses are available.

Michaels, Ross & Cole, P.O. Box 4538, Oak Brook, Ill. 60521.

REMOTE COMPUTING SERVICES

AUTOMATIC DATA PROCESSING, INC.
Automail revised rates

Automatic Data Processing, Inc. (ADP) has announced a revised rate structure for Automail, the company's electronic mail service. The new structure is based on the number and type of transactions performed rather than the amount of time elapsed during a session.

Under the transaction-based pricing, users will be charged for each mail activity they perform, such as sending or filing a message, adding or listing identifications in the directory, or posting information to public or private bulletin boards. Message senders will be charged according to the size of their message and the number of copies generated. Message recipients will incur no charge for reading incoming, unread messages, the vendor said.

The basic charge to create and send a message to the first addressee is 75 cents per message segment (1,000 characters). The cost to send the message to additional recipients is 30 cents per address. There is no charge for connect time when Automail is accessed directly via ADP's Autonet public data network. However, time-oriented surcharges will continue to apply to access made through third-party network and Wats connections, a spokesman said.

Automatic Data Processing, 175 Jackson Plaza, Ann Arbor, Mich. 48106.

MIDCOM CORP.
Time-share access

Midcom Corp. has announced that its time-shared system can be accessed using the GTE Telenet Communications Corp. Telenet data communications network.

The Midcom T/S service is based on Digital Equipment Corp. VAX/VMS and PDP-11 computers and features several languages, including Fortran, Basic, Cobol, Pascal, C, PL/I, Bliss and macro.

Telenet usage reportedly costs Midcom users $3/mo to $6/mo. Midcom's time-sharing service, meanwhile, is sold on the basis of the amount of user storage and either on a continuous, peak level or limited time-access basis.

For 1M byte of storage, the cost is 3 to 5 cents/CPU sec, with a $2/hour connect charge. For 10M bytes of storage, the firm offers its lease-a-port rate of $800 a month, with a minimum one-year lease.

Midcom, Suite 117, 1940 N. Tustin, Orange, Calif. 92665.

ON-LINE DATA BASES

OCCUPATIONAL HEALTH SERVICES, INC.
Hazardline enhancements

Occupational Health Services, Inc. has announced that it has enhanced its on-line Hazardline data base.

According to a spokeswoman, the number of substances listed in the interactive Hazardline data base of toxic and chemical substances has been increased to 3,000. The Hazardline data base is currently offered through GTE Telenet Communications Corp.'s Telenet and Compuserve, Inc.'s Compuserve services.

Access to Hazardline through Telenet or Compuserve is priced at $2 per connect minute. There is no monthly or subscription fee.

Occupational Health Services, 515 Madison Ave., New York, N.Y. 10022.

ITT DIALCOM, INC.
AP Videotex service

ITT Dialcom, Inc. has added the Associated Press (AP) Videotex service to its on-line news and information features.

AP Videotex provides national and international news, analysis and feature stories accessed via computer.

According to a spokesman, AP Videotex is key-word-searchable. Approximately 250 stories are filed daily on the service.

Story transmissions are made at 1,200 bit/sec over a dedicated circuit via AP's satellite system to ITT Dialcom. The circuit is an 8-level, Ascii-coded system designed to the American Newspaper Publishers Association Standard No. 1312.

The cost of accessing AP Videotex is $27.50/hour during prime business hours (8

INFORMATION ACCESS CO.
DIALOG INFORMATION SERVICES
Magazine Asap; Trade & Industry Asap.

Information Access Co. (IAC) and Dialog Information Services have announced two full-text, on-line data bases of major magazines.

Created by IAC, the new data bases are called Magazine Asap and Trade & Industry Asap. The Asap files reportedly will offer controlled vocabulary indexing of periodicals, as well as the full text of articles from more than 40 major general-interest periodicals and more than 80 business and trade publications on-line through Dialog. In addition, the complete text of news releases from PR Newswire will be available in Trade & Industry Asap. Coverage will date back to January 1983.

The new services will be available to all Dialog subscribers in May. There is no initial fee or monthly minimum for using the Asap data bases. Dialog charges are only for actual on-line time, plus a flat charge per article. The average hourly connect time charge is $75.

Dialog, 3460 Hillview Ave., Palo Alto, Calif. 94304.

IAC, 11 Davis Drive, Belmont, Calif. 94304.

DATA MANAGEMENT COMPUTER SYSTEMS, INC.
Knowledge/3000

Data Management Computer Systems, Inc. (DMCS) has introduced Knowledge/3000, an on-line information retrieval system for the Hewlett-Packard Co. HP 3000 computer.

According to the vendor, the regularly updated data base cross-references all the HP manuals included in the fundamental operating software — the HP Communicator — as well as publications from the HP 3000 International Users Group.

A 12-month subscription to Knowledge/3000 is available for $1,500. Annual renewals are $750. A demonstration tape costs $50.

DMCS, Suite G, 560 Wall St., Auburn, Calif. 95603.

GOVERNMENT COUNSELLING LTD.
Taurusonline

The Technology Acquisition Resource and Update Source (Taurus), a data base with government procurement regulations for data processing equipment, is now available with a computerized option, Taurusonline, from Government Counselling Ltd.

Taurus contains all government regulations, standards and laws applying to the procurement of software and hardware for data processing, office automation and telecommunications.

Users of the Taurusonline option may search the data base with an unlimited variety of search criteria, according to the company; no key fields or indexes are needed.

To access Taurusonline, which will be available at the end of March, users need any system that can communicate with an IBM host through a 3270-type terminal. The annual fee for Taurus is $2,000, with an additional fee of $180/hour and $2/transaction for the on-line option.

Government Counselling, 6525 Fedbin Court, Alexandria, Va. 22310.

See DATA page 98

OLYMPICS from page 59

cannot speak English; writing system specs, because the systems analyst thinks "on-line" is a term meaning his clothes are drying outdoors; punching cards by hand, because the keypunch personnel are on strike; and mounting tapes, because the operator is having his coffee. In short, the hexadecathlon includes all the functions expected of a programmer, none of which is listed in his official job description.

The bullshot put. This is a true/false game in which the programmer must figure out whether he is being told the truth by those around him. Phrases tossed at the programmer include: "We always compensate our staff for overtime"; "Don't worry about that program — it's transparent to you"; "Could you please stay a little late today — I'll only need you for an hour or so"; or "We're putting you on a hot development project next month."

The programmer can, of course, respond with his own—uncertain replies: "Of course I tested that module"; "You'll have it tomorrow"; and "Me? Looking for another job? Ridiculous!"

The 100-parameter dash. Speed is the main thrust of this event. The object of the 100-parameter dash is to see how fast documentation can be written for a 100-program system (which took six months of development) because operations refuses to run it and because the users are screaming for it. Last year's gold medalist took only a mere 47 nanoseconds.

Gulpundy is a New York-based systems analyst.

INTECH from page 58

explosion and sequencing diagrams.

The package includes the software on 5¼-in. diskettes, full documentation, keyboard template and the Microsoft Mouse and Word packages. Single-version prices start at $8,000, Intech said from Five Cambridge Center, Cambridge, Mass. 02142.

So you'd like to add the flexibility of a popular personal computer to the power of your WANG 2200. But you don't want to spend $10,000 to do it.

IF YOU OWN A WANG 2200, YOU JUST SAVED THOUSANDS OF DOLLARS.

What if you could get that personal computer – say an Applefe or an IBM XT – for thousands less than you'd expect to pay. Plus a hard disk and printer at no additional cost. *And* you could run just about any software package on the market today?

Interested? If you could get all of this and pay only $1,995, you'd be standing in a long line to buy one. Well, forget about that line. You've already got almost everthing you need. In fact, you *don't* need another computer...you *don't* need another hard disk...you *don't* need another printer...and you surely *don't* need to spend another $10,000.

All you need is Micro-Bridge 80, a plug-in board that allows any terminal on your WANG 2200 system to act like a CP/M-based personal computer. This revolutionary new product is the most economical way to expand your 2200 system without buying additional

computers and peripheral equipment. And it costs just a fraction of what you'd pay for a popular personal computer.

Choose the software that's best for you. With Micro-Bridge 80, you don't have to compromise any more. Now you can choose the software that works best for you...software that's easy to use or software with sophisticated features, designed to fit your specific requirements. With over 2,000 CP/M programs to choose from, you can design a system that works for you. Powerful software applications that others have been using for years are now available to you. Like dBASE II™, Supercalc, WORDSTAR™, the Peachtree Accounting Series, and many, many others. And to get you started in the right direction, we've got a bonus for you.

Free CP/M operating system and Microsoft's Multiplan! Of course you get a copy of the CP/M operating system (Version 2.2). But that's not all. You also receive a copy of Microsoft's Multiplan spreadsheet. This best-selling, easy-to-use package was voted Software Of The Year by *Infoworld* magazine, which is why we include a copy of it with every Micro-Bridge 80...we want you to start off with the best.

Remember, CP/M 2.2 and Multiplan are included at *no extra charge* with your purchase of Micro-Bridge 80.

Communications made simple. Micro-Bridge 80 has two serial (RS-232) communication ports that make it easy to communicate with public data bases like The Source and CompuServe. It's not only easy, it's fast, because Micro-Bridge 80 communicates directly with on-line services. There's no need to tie up the 2200's CPU with communications protocols and log-on procedures.

Simple and easy to use. When you want to use CP/M, just type in a single command on your WANG terminal keyboard, and Micro-Bridge 80 turns control over to CP/M. That's all there is to it. And Micro-Bridge 80 doesn't interfere with normal WANG 2200 operations. In fact, on multi-user systems you can run CP/M at one terminal while someone else runs WANG software at another terminal on the system.

Easy to install. Anyone can install Micro-Bridge 80 easily in 15 minutes. No special tools are needed. No technical expertise. Simply remove the I/O panel cover of your 2200 and slip Micro-Bridge 80 into an empty slot. No other hardware alterations are necessary.

Order your Micro-Bridge 80 today and begin running CP/M software on your 2200 tomorrow.

Micro-Bridge 80 is not a promise for the future...it's fully tested and ready for shipment *today.*

Order your Micro-Bridge 80 package today and start using the CP/M software you've needed for years. For more information concerning Micro-Bridge 80, or for the location of the Micro-Bridge 80 dealer nearest you, just call us toll-free and ask for Micro-Bridge.

The entire Micro-Bridge 80 package sells for $1,995 and includes:

- Micro-Bridge 80 circuit board
- Installation & operating instructions
- CP/M 2.2 operating system
- Multiplan spreadsheet software
- 90 day limited warranty on parts & labor

*Optional hardware maintenance and software enhancement programs available. Ask for details when you call.

SOFTWARE & SERVICES

BASES from page 67

BUSINESS COMPUTER NETWORK, INC.
Point-to-Point Communications

Business Computer Network, Inc. has announced a communications protocol for users of the vendor's data base services.

The Point-to-Point Communications protocol reportedly is a method by which various types of microcomputers, connected directly or through a modem or local-area network, may communicate interactively, according to a Business Computer Network spokesman.

The protocol is designed for Digital Research, Inc.'s CP/M operating system on Kaypro Computer Corp. Kaypro II, 4 or 10 microcomputers with a Hayes Microcomputer Products, Inc. Smartmodem 300. It also operates on IBM's Personal Computer and Compaq Computer Corp.'s Compaq microcomputer.

The software is provided free of charge to customers of the vendor's data base services.

Business Computer Network, P.O. Box 36, 1000 College View Drive, Riverton, Wyo. 82501.

TRAINING

SCIENCE RESEARCH ASSOCIATES, INC.
IBM VS Cobol II facilities

Science Research Associates, Inc., a subsidiary of IBM, has announced an independent study course in IBM VS Cobol II facilities, a course announced concurrently with IBM's introduction of VS Cobol II.

The course allows users to learn the new facilities of the compiler and focuses on such topics as structured programming concepts, implementing the sequence and the case structure and selection and iteration structures.

The course consists of a two-volume text, a videocassette and a reference guide and reportedly requires nine to 11 hours to complete.

IBM VS Cobol facilities can be leased for 30 days at $315 or for 12 months at $900.

Science Research Associates, P.O. Box 5380, Chicago, Ill. 60680.

SUBJECT from page 59

of the operational environment: performance and availability. These considerations are important when following the blueprint of subject data bases because subject data bases tend to concentrate data tightly and nonredundantly. The centralization of data that results may not be optimal for either on-line performance or availability.

Performance is hindered when more than one on-line activity must access data at the same time. In the case in which two on-line processes want to update the same data at the same time, the conflict must be resolved. The result of the contention for data under integrity control is a system slowdown.

Contention also occurs when multiple large data base scans are done over the same data base. When long-running activities can be spread over multiple physical data bases or even over multiple machines, performance problems can be minimized.

But when there is a single machine with a single physical data base with much activity directed at the data base, performance most likely will suffer.

One solution is to break up the physical units of data as finely as possible into small data base records, nodes, pages or whatever is the physical unit of storage. This minimizes the amount of data locked, which, in turn, minimizes the probability that data will be unavailable for access because of contention.

The other contention problem — that of doing large data base scans — can be alleviated by implementing a standard work unit in which large activities are broken down into a series of shorter activities.

For example, a data base scan of 10,000 records can be broken into a series of 200 scans of 50 records, with intermediate reporting at the end of each scan.

Another solution

Another solution is to break a data base into multiple physical data bases. For example, a large parts data base containing parts with key values from 0000 to 9999 is broken into four physical data bases for parts based on key value. This split will allow data to be moved to different environments (such as batch or on-line), to different machines and so forth. The ability to break up data bases at the highest physical level enhances the overall performance profile of the data.

The other subject data base problem in the operational environment — availability — is alleviated when subject data bases are physically broken into different data bases. For example, a data base, A, with one million records is divided into three data bases — A', A" and A"' — each of which has about 333,333 records. The fact that the subject data base is implemented across three physical data bases does not negate the effect of modeling and integrating data. When A goes down and must be recovered, the entire system is lost. But when A' goes down, only one-third of the system is lost.

Since subject data bases tend to centralize many different environments, the separate recoverability of data is very important.

Some data base management systems have facilities for separate recoverability buried within the system software; nevertheless, the physical division of the data still needs to be carefully planned.

Inmon is a director at Coopers & Lybrand in Denver, a noted author on the subject of data base design and a regular contributor to Softline.

WE WROTE THE BOOK ON DOCUMENTATION. AND THEN WE THREW IT AWAY.

Communication Sciences Introduces Explain. *The system that puts your software documentation where you need it most—online and in your data base.*

With Explain, you can create online user help, training procedures, program documentation and more. Because Explain uses the power of your DBMS, you can maintain the documentation as easily as you do the rest of your business data.

Access to the online documentation is at the user's fingertips. With simple commands, users can retrieve the help they need—directly from any application you link to Explain.

Chosen by Comserv Corporation as the online help system for AMAPS/3000, Explain is a powerful tool for both writers and readers of software documentation. And it's available to users of HP/3000/Image and IBM series 30xx and 43xx systems.

With Explain, you can afford to throw the books away. And keep the documentation.

For more information: call us at (612) 332-7559, or write to Communication Sciences, Inc., 100 North Seventh Street, Minneapolis, MN 55403.

900 GUEST ROOMS AND COMPLETE MEETING FACILITIES IN HOUSTON'S GALLERIA.

Surround your meeting with the excitement of the spectacular Galleria. A city of 250 shops under glass, where excellence in dining, recreation, shopping and entertainment are side by side with Houston's most complete meeting environment.

Only The Westin Galleria and The Westin Oaks offer the world's largest lobby under one roof. 900 guest rooms and suites, 32 meeting rooms in a range of sizes, three ballrooms, an exhibition hall, professional in-house catering and audio-visual services. An adjoining health and sports facility has a jogging track and heated outdoor pools.

Hold your next business meeting in Five Diamond award-winning luxury, at *surprisingly competitive rates.* The Westin Hotels of Houston. Excellence, in the heart of the Galleria.

Please call, 713-960-8100, and ask for the Director of Sales. The Westin Oaks, 5011 Westheimer, The Westin Galleria, 5060 West Alabama, Houston, Texas.

Value-added mart to prosper: report

NEW YORK — IBM and AT&T only began offering enhanced data communications services in 1983, but by 1986 they will have grabbed a 30% share of this fast-growing market, according to a study released here recently.

The report, titled "The Enhanced Data Network Market," prepared by Frost & Sullivan, Inc., estimates 1982 revenues of value-added network carriers at $300 million and forecasts 1986 sales of $1.5 billion. Firing this growth is the explosive increase in small computers requiring interconnection both with each other and with remote data bases.

Despite their orientation to analog voice communications, telephone carriers are estimated to have garnered 50% of a $4.3 billion data communications market in 1983 and will still have 67% in 1986, by which time the market will have doubled in real terms, according to the report.

However, enhanced-service carriers' share of the market will jump from 8% to 18% over the same period. Satellite carriers, also fast growing in this area, are expected to have attracted less than 4% of the market by 1986.

The appeal of enhanced data communications networks for users is their ability to link diverse equipment using dissimilar communications protocols. According to Frost & Sullivan, in today's relatively free-wheeling regulatory environment, these networks — "enhanced" through computer control and data manipulation — can be expected to put more emphasis on services that go beyond mere transmission, such as store-and-forward message services and transaction processing support.

All the established players in this young market — which, besides GTE Telenet Communications Corp. and Tymnet, Inc., who dominate the group, includes Graphnet, Inc., Uninet, Inc., Compuserve, Inc. and others — can expect to be jolted by two events of the past year, the report notes.

AT&T entered the fray with its ACS/Net 1000, combining a packet-switched network from AT&T Communications with applications-oriented services by AT&T Information Systems, Inc.; IBM rolled out the Information Network to allow its own and IBM-compatible computers and terminal equipment to link up over a network installed, operated and managed by IBM, according to the report.

From the user's point of view, there are three categories of data communications services: private, dedicated lines and networks; the dial-up public telephone network; and the enhanced services provided by packet-switched public data networks, which are the subject of the report.

"Of the three, the first category is chosen by large corporate users with large data processing centers," the report notes. "The second will satisfy most occasional users who want minimum fixed investment and are less demanding and less sophisticated about data communications, being satisfied with a slower setup, lower speeds and a higher error rate.

"Enhanced services appeal across a wide spectrum from the occasional but sophisticated user, particularly in interactive applications, to the most demanding user interested in optional special features in processing, storage and conversion.

Vitalink signs marketing pact with Prime

MOUNTAIN VIEW, Calif.— Vitalink Communications Corp. recently announced the signing of a joint marketing agreement with Prime Computer, Inc. that is similar to a recent pact reached with Hewlett-Packard Co.

Under the terms of the agreement, Prime will serve as the initial point of contact for the service, and Vitalink will sell and install the equipment. Both Prime and Vitalink will be responsible for system compatibility.

The Vitalink system connects to the data link interface of Primenet communications software. "This provides Primenet with multiple data paths at transmission rates ranging from 4.8K bit/sec to 56K bit/sec," the vendor said. Vitalink equipment, including the satellite dish antenna installed at the customer's site, costs $140,000 per site (more than one is needed). The service charge is $1,800/mo.

Vitalink is located at 1350 Charleston Road, Mountain View, Calif. 94043.

Ungermann-Bass inks agreements with two firms

LAS VEGAS — Local-area network manufacturer Ungermann-Bass, Inc. said at Interface '84 that it has signed separate development agreements with Davong Systems, Inc. and Protocol Computers, Inc.

Ungermann-Bass said the deal with Davong will enable it to expand the Net/One Personal Connection — an intelligent board-level network interface unit for IBM's Personal Computer — to use Davong's hard disks and streaming tape drives. This will allow networked micros to access 160M bytes of on-line storage.

The agreement with Protocol Computers, Ungermann-Bass said, will result in a series of offerings enabling access to multiple operating systems environments.

The initial products offered are said to provide conversion for asynchronous Ascii-to-SNA 3270, Ascii-to-BSC 3270 and Ascii-to-IBM Systems 34/36/38 as well as 3270 deconversion to asynchronous Ascii.

Ungermann-Bass is at 2560 Mission College Blvd., Santa Clara, Calif. 95050.

Genesys Group to install network in Oklahoma City

OTTAWA — Genesys Group, Inc. has announced a videotex public access information system geared primarily to providing tourists and residents of Oklahoma City with information about special events, activities and attractions in the state's capital city.

Users will be able to access information through public terminals in 40 locations throughout the city, including the Will Rogers Airport and a number of major hotels, starting May 1, a spokesman said.

The system uses a Digital Equipment Corp. PDP-1144 mainframe computer with two 120M-byte disks and is outfitted with Genesys videotex software, which utilizes the North American Presentation Level Protocol Syntax, the vendor said.

There is no charge to users, according to the Genesys spokesman.

Further information is available from the Genesys Group, Third Floor, 1755 Courtwood Crescent, Ottawa, Ont. K2C 3J2.

DATA RENTALS SALES, Inc

Bell South to introduce packet-switched net

By Phil Hirsch
CW Washington Bureau

WASHINGTON, D.C. — A whole new way of retailing many mass market products and services will develop from Pulselink, a packet-switched network Bell South plans to introduce later this year.

That is the opinion of Walt Weyand, Pulselink's marketing manager, who was interviewed by phone last week after disclosing some details about the network at a conference held here a short time earlier.

Pulselink, he said, provides a way of operating a network of automated gasoline service stations from a central location; it can update a retail chain's central inventory records whenever a clerk in a remote store makes a sale. Pulselink can also support home teleshopping services, download software to personal computer users, read electric utility meters, monitor home security systems and interconnect banks with widely dispersed automatic teller machines. Many of these services, Weyand added, will be offered later this year in Atlanta, Charlotte, N.C., and/or Columbia, S.C. — the first three metropolitan areas in which Bell South plans to tariff Pulselink.

Weyand said that because users of information-based services typically communicate in short bursts, a packet-switched net is better suited for this type of traffic than the circuit switch telephone net and that a greater number of terminals and users can be accommodated.

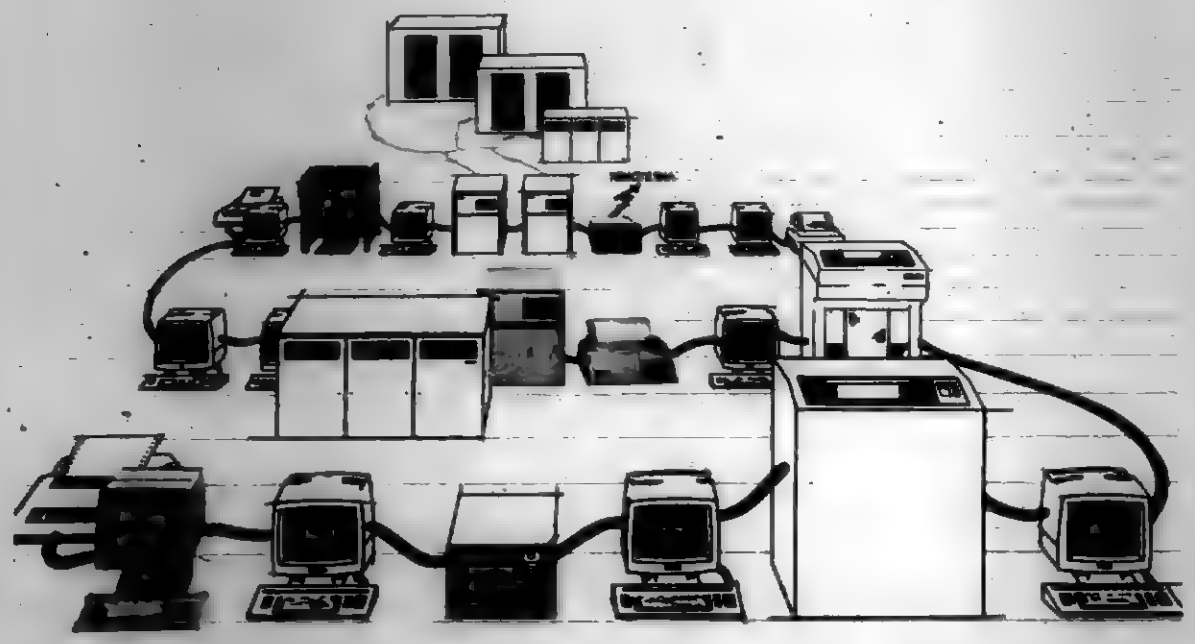
He added that because most users of on-line information services use nonpacketizing terminals, it is necessary for the network provider to include end-to-end protocol/code conversion as part of the service. This is not possible, though, according to Weyand, because of the Federal Communications Commission's Second Computer Inquiry decision. Specifically, Computer Decision II says that AT&T and the now-divested Bell operating companies can offer end-to-end protocol/code conversion only if they do so through separate subsidiaries or obtain a waiver from the commission for each service offering.

If Bell South cannot include end-to-end protocol conversion as part of its Pulselink service, Weyand said, "our revenue stream will be reduced substantially."

AT&T, contending that divestiture made the waiver process unworkable, has asked the FCC for rules that would permit it "to provide code and protocol conversion on the same unrestricted basis as other carriers," for example, GTE, which through its Telenet subsidiary, operates a nationwide packet-switched network. A number of former Bell operating companies have supported the petitions.

But several organizations representing intelligent terminal makers and vendors of on-line information services contended that the waiver provision should be retained. As the Association of Data Processing Service Organizations, Inc. put it: "The adverse consequences . . . alleged to flow from the [FCC's order] are more imagined than real. . . . [The commission] should expressly prohibit, without a waiver, the provision of code and protocol conversion services by AT&T and the [former Bell operating companies] to facilitate interconnection between disparate terminals."

Weyand said last week that Bell South plans to seek a Computer Decision II waiver for Pulselink soon. Almost certainly, the other former Bell operating companies that submitted comments late last month have similar services under development. Thus, the commission's consideration of the Bell South application could affect how quickly Pulsecom-type networks become available elsewhere.



3270 Networking: No More No Man's LAN.

Imagine. 3270 Processing. Integrated Personal Computing. Local Area Networking. And SNA Compatibility. In One System.

Imagine a system that successfully settles the uncharted territory of 3270 local networking—that "no man's LAN" of unlinked and unrealized potential.

Imagine a system that delivers the power of 3270 processing, and the flexibility to build two local area networks from a single controller. Imagine being able to attach up to 120 devices to that controller. Or attaching four distinct controllers—and multiple coaxial links of up to 10,000 feet each—to any of those LANs.

Imagine the economies of a system that handles that networking with standard 3270 coax. That requires no commitment to special architectures or non-standard LAN technologies. And that, thanks to a multi-drop, station-to-station design, can eliminate thousands of feet of new coax.

Of course, such a system would have SNA compatibility. But it would also have a set of capabilities to dramatically increase throughput, while reducing hardware and support cost in *any* environment. Capabilities like multi-host and multi-personality support, application and address switching, and system printing.

This system would have multi-user personal computing "built into" the network—allowing you to assign true 16-bit computing power, maintain overall MIS control and share expensive disks and printers.

Such a system would boast an intelligent display station that displays a mastery of ergonomic and aesthetic design. With multi-screen formats, anti-glare screen, low-profile keyboard, and a tilt-and-swivel pedestal with the smallest footprint in the industry. Such a system would also include a full line of printers.

Imagine. 3270 processing. IBM-compatible personal computing. Versatile, economical, powerful local area networking. In one system.

Braegen *has* imagined just such a system. They have designed it. Built it. And called it the ELAN™ System.

If such a system sparks your imagination, give us a call. We know the feeling. The Braegen Corporation, 525 Los Coches Street, Milpitas, CA 95035 (408) 945-8150; TWX: 910-338-7332

Imagine. Then Make It Better.

BRÆGEN

Net 25 family fits CCITT X.25

Telematics International, Inc. has introduced the Net 25 family of packet-switching nodes compatible with CCITT X.25.

The Net 25 family includes concentrator nodes, secondary nodes and backbone nodes, with throughput rates of up to 600 switched packets per second.

The Net 25/100 is the entry-level packet-switching node, ideally suited for use as a concentrator node, the vendor said. It has a throughput of up to 100 (128-byte) switched packets per second. It features up to 16 CCITT X.25 access lines, providing standard RS-232C interface with channel rates up to 19.2K bit/sec, 1M byte of memory and 5M bytes of local disk storage.

The Net 25/200 (primary node) has the capability to expand to a backbone node, according to the vendor. It has throughput of up to 200 (128-byte) switched packets per second.

See NET page 72

ADDS Viewpoint/Color from your point of view.

EVEN BOSSES NEED A LITTLE COLOR.

Right out of the box, the new ADDS Viewpoint/Color brings extra clarity and comprehension to any business application. Bosses like that.

They also will like the ergonomically designed detachable keyboard with its separate key cluster for numeric entry and cursor control. And the display screen which tilts from a minus 5° to a plus 15° and swivels a full 360° for comfortable viewing.

But should only a boss deserve color?

The full-featured ADDS Viewpoint/Color costs less than many monochrome terminals so there's no reason not to let color improve your communications company-wide. That makes nine good reasons to buy ADDS Viewpoint/Color terminals. Red, blue, green, yellow, cyan, magenta, white, black and price.

IT ALL ADDS UP.

ADDS
Applied Digital Data Systems Inc.
A Subsidiary of NCR Corporation
100 Marcus Blvd., Hauppauge, New York 11788

Novell testing its file server software

OREM, Utah — Novell, Inc., a designer and supplier of software for local-area networks, has begun benchmarking its file server operating system against the file server software supplied by vendors of local-area networks.

The company will compare the performance of eight local-area networks as they provide IBM Personal Computers and work-alikes with access to files in a shared Winchester disk drive.

"Preliminary tests were run on a stand-alone [IBM Personal Computer XT] to establish a set of starting-point measurements," the company reported, and then timing tests were conducted twice on each network — once with the local-area network manufacturer's own server software and again with the software provided by Novell.

Local-area networks included in the test are Corvus System, Inc.'s Omninet; Davong System, Inc.'s Multi-Link; Gateway Communications, Inc.'s G-Net; 3Com Corp.'s Ethertink; Orchid Technology, Inc.'s PC-Net; Proteon Associates, Inc.'s Pronet; Nestar Systems, Inc.'s Arcnet; and Novell's Netware/S.

The benchmark will include 128K-byte and 512K-byte read and write tests; a 356K-byte record write test; create, write and delete tests; and save and copy tests using Wordstar text. In each test, the elapsed time in seconds is recorded as the performance data, according to Novell.

The benchmarks are meant to "illustrate that performance is not only a function of hardware, but software as well," a company spokesman said. "For the first time in a network environment, there is a common denominator capable of increasing performance on all local-area networks while maintaining uniform functionality across all topologies."

Additional information is available from Novell, located at 1170 N. Industrial Park Drive, Orem, Utah, 84057.

If you're looking for a UPS system that will fit into small spaces, Exide Electronics has exactly what you need. The Exide Electronics Series 1000 UPS.

The fact is, many "small" UPS systems aren't really that small in size, especially when you consider the power they offer. And even if they could fit into available space they may not blend well with your environment.

Not the Series 1000 UPS. It packs a lot of power (3KVA) into a neat, space saving package. It's designed to fit *and* blend into the workplace. It's also designed to fit into your budget because in addition to its small size we gave it a small price (under $6,000).

Another nice thing about the Series 1000 UPS is its speedy delivery. If you need one right away you won't have to wait a month or even a week. It'll be on its way to you within 24 hours. And the Series 1000 will soon be available in 1.5KVA and 5KVA.

The Exide Electronics Series 1000 UPS. It's what small UPS systems should have been in the first place.

Battery housing of system may vary depending on system requirements.

MULTIPLEXERS/ MODEMS

GANDALF DATA, INC. GLM 528; GLM 510

Gandalf Data, Inc. unveiled two new products at Interface '84 that it has added to its Linc Miners family of multiplexers.

The GLM 528 is said to be optimized to connect a large number of personal computers or other devices to the company's PACX data network switch or directly to a host via a local or long-haul T1 (1.54M bit/sec) link.

The GLM 528 is said to cost $35 to $40 per channel and is scheduled to be shipped in April.

Gandalf also announced the GLM 510, a device with an integral modem that supports four or eight asynchronous channels over a four-wire circuit that operates at speeds up to 9.6K bit/sec.

Prices range from $375 for the module versions compatible with the company's PACX switch to $600 for the stand-alone, eight-channel model.

Gandalf Data, 1019 S. Noel, Wheeling, Ill. 60090.

EMULEX CORP. C802 series multiplexers

Emulex Corp. has announced the C802 series communications multiplexers for Digital Equipment Corp. processors.

According to the vendor, the product comes in two models: the C802/HA is designed to work with the LSI-11/23 and LSI-11/23 Plus processors, and the C802/HB works with the Micro/PDP-11 computer.

Both the C802/HA and C802/HB are list-priced at $2,300.

Emulex, P.O. Box 6725, 3545 Harbor Blvd., Costa Mesa, Calif. 92626.

NET from page 70

The backbone node, the Net 25/400, features up to four high-speed trunk channels, up to 16 CCITT X.25 access lines, 1M byte of memory and 5M bytes of local disk storage.

Additional nodes include the Net 25/800 High-Performance Backbone Node, the 25/SP Switching Pad and the Net 25/SN Supervisory Node. Prices range from $20,000 for an entry-level configuration to $300,000 for a full configuration.

Telematics International is located at Crown Center, 1415 N.W. 62nd St., Fort Lauderdale, Fla. 33309.

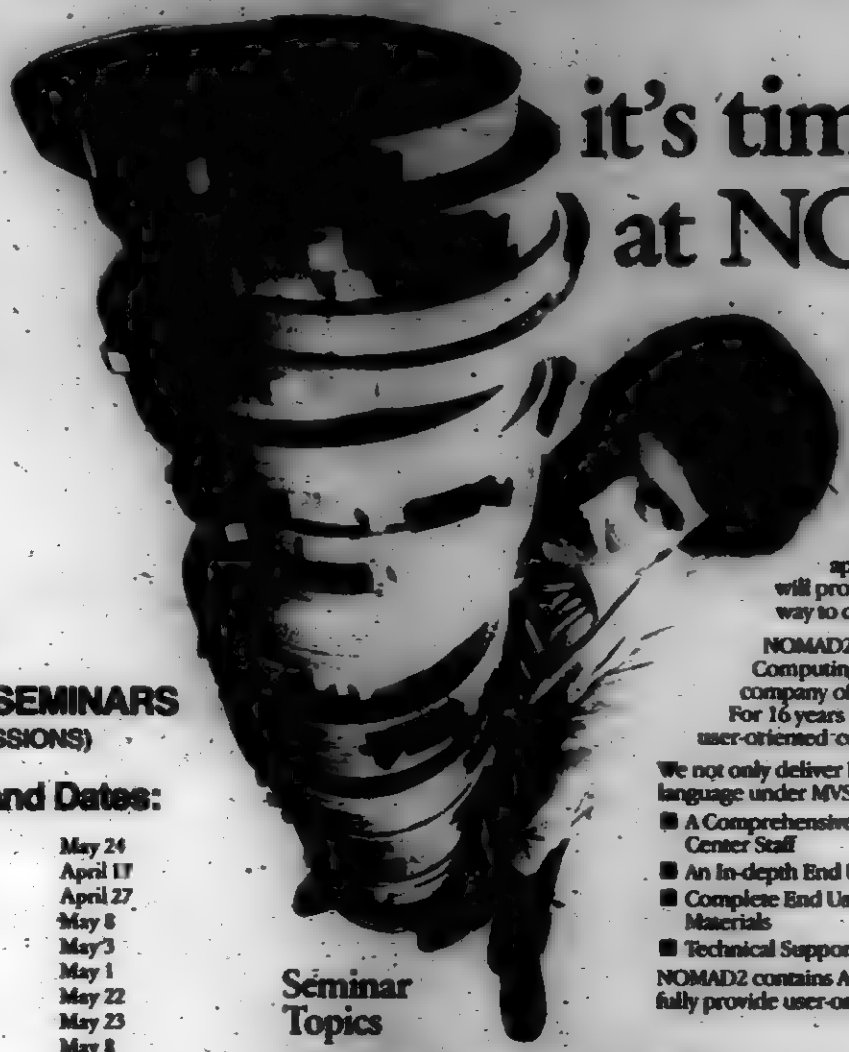
FROST from page 69

Only enhanced networks hold the promise of truly distributed data processing," the report states.

The study also analyzes and forecasts equipment demand of enhanced-service carriers. In current dollar terms, data circuit terminations equipment purchases, estimated at $35 million in 1983, are expected to reach $160 million in 1986. Switching node equipment spending by these carriers will climb from $24 million to $120 million over the same time period, and data termination equipment spending will expand from $14 million to $20 million.

The report (No. 1224) costs $1,400 and is available from Frost & Sullivan, 106 Fulton St., New York, N.Y. 10038.

If delivering user-oriented computing is getting you down...



it's time to look at NOMAD2!

Delivering user-oriented computing can be a tricky business. If it's your objective to satisfy the user community in your organization, it's time to speak to the experts. We'll share our experience with you at our FREE NOMAD2 Seminars.

Whether you're interested in an Information Center, Development Center, end-user computing or just quick applications development, our seminars will provide you with a closer look at the best way to deliver user-oriented computing.

NOMAD2 is a unique product created by D&B Computing Services, the information services company of The Dun & Bradstreet Corporation. For 16 years we have been delivering value added user-oriented computing services.

We not only deliver NOMAD2, the premier fourth generation language under MVS and VM, but also provide . . .

- A Comprehensive Training Program for Your Information Center Staff
- An In-depth End User Training Program
- Complete End User Documentation and Training Materials
- Technical Support for Your Information Center Staff

NOMAD2 contains ALL the components you need to successfully provide user-oriented computing services.

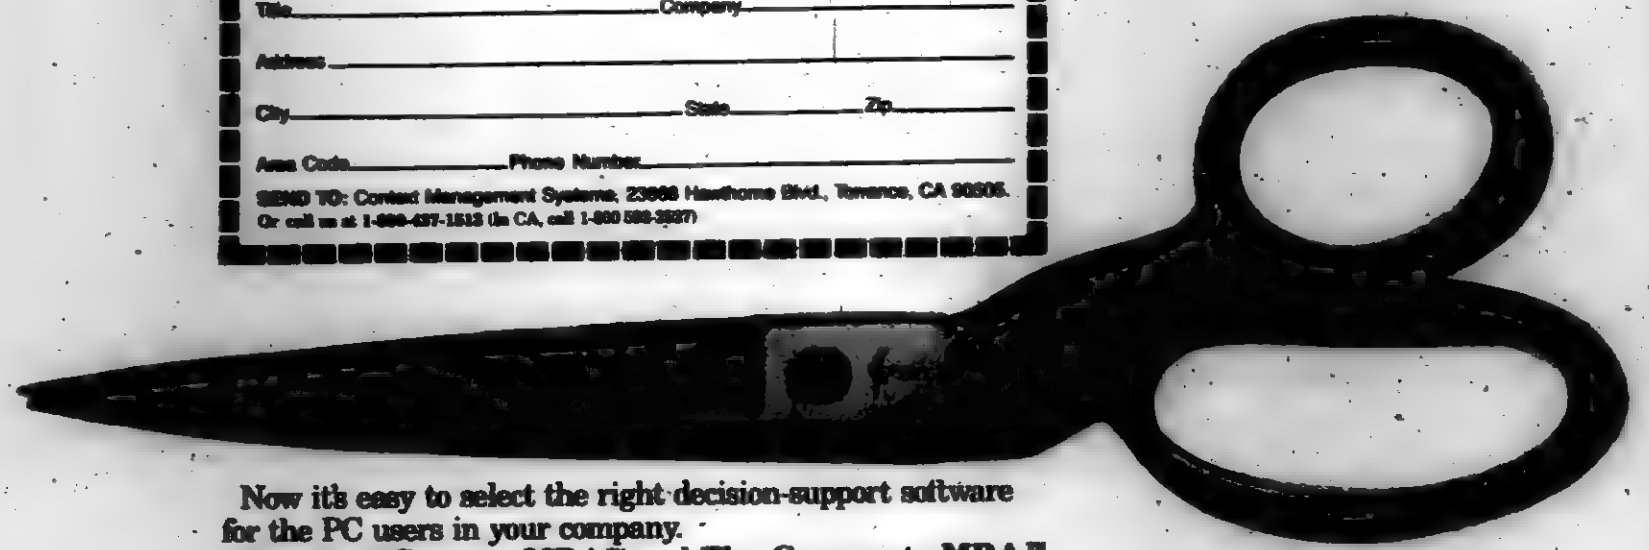
SEND TO: Context Management Systems, 23868 Hawthorne Blvd., Torrance, CA 90505.
Or call us at 1-800-437-1513 (In CA, call 1-800 588-2537)



Now it's easy to select the right decision-support software for the PC users in your company.

The New Context MBA™ and The Corporate MBA™ both have all the functions PC users in your company need: Spreadsheet, Business Graphics, Database, Word Processing, Telecommunications, and Forms Creation.

They're all *integrated* in one software package. With advantages that'll make your life a whole lot easier.

Like full 3270 emulation. So *you* can connect their PCs to your Data Center network. For immediate, yet controlled, access to decision data. No more hand-holding or custom programming.

PC users in your company get the decision-support capability they need from a single, easy-to-learn package. And you get an easy way to plug one PC software package into the entire company.

Our **Context 500™** support team builds a custom training and ongoing support program for your company, so *you* don't have to.

Now *your* job of supporting *our* software is as easy as picking up the phone.

So make it easy on yourself. Cut out, fill in, and send us this coupon. And cut out a lot of heartburn over which of many PC software packages to choose.

Now where did you put those scissors?

SYSTEMS & PERIPHERALS

Gould unveils trio of design systems

By Tom Henkel
CW Staff

FORT LAUDERDALE, Fla. — Gould, Inc.'s Computer Systems Division recently announced a 32-bit graphics system, the Powerstation (PS) 5000, and two turnkey computer-aided design and manufacturing (CAD/CAM) workstations, the Powerstation 3100 and 5100.

Based on the Unix operating system, the PS5000 was designed for compute-intensive electrical, mechanical, architectural and engineering design applications. It incorporates a 32-bit superminicomputer and a dedicated graphics processor packaged in a single cabinet, the vendor said.

The unit's CPU can accommodate up to 16M bytes of virtual memory, up to 32K bytes of cache memory per processor and the ability to interleave main memory. The system was designed around Gould's synchronous bus architecture, the Selbus, which features a 26.7M-byte data transfer rate, the vendor said.

Other features reportedly include instruction and operand prefetch, a four-stage instruction pipeline, base register support and a variety of peripherals.

The PS5000 includes an integral 80M-byte Winchester disk subsystem, consisting of a disk drive, power supply and disk processor. Data backup is achieved

Gould's PS5000 graphics workstation

through a removable 65M-byte cartridge magnetic tape subsystem, which includes a tape drive, power supply and tape processor, the vendor said.

The PS5000 supports the firm's UTX/32 operating system, which contains features of both the Bell Laboratories and the University of California at Berkeley versions of Unix, according to the vendor.

The unit's graphics subsystem is a parallel interface to the CPU that displays both color and monochrome graphics output from the PS5000. It consists of a 19-in. color display monitor, keyboard and mouse, the vendor said.

An I/O processor operates independently and in parallel with the CPU and generates a 16-bit asynchronous I/O bus that can transfer data at up to 1.5M byte/sec, the vendor said.

A basic PS5000 base enclosure consists of two 1M-byte integrated memory modules, an 80M-byte Winchester disk subsystem, a 60M-byte tape subsystem, a graphics processor, keyboard, mouse and a power supply. It costs $99,000. The base enclosure reportedly can be expanded to include an additional 80M-byte disk drive, up to 5M bytes of physical memory, 16 serial communications ports, a hardware floating-point accelerator and a link to Xerox Corp.'s Ethernet local-area network. The product is available 90 days after receipt of order.

For CAD/CAM manufacturing applications, Gould has announced the PS3100 and PS5100. The units are turnkey systems aimed at mechanical designers.

The PS3100 was designed around Gould's PS3000 16/32-bit processor and includes a color graphics terminal and graphics processor. Similarly, the PS5100 is based on the firm's 32-bit PS6000 virtu-

Locom add-in memory unit targets IBM processors

SAN JOSE, Calif. — Locom Corp. has announced the LCM-400, an add-in memory unit for IBM's 4331, 4341 and 4361 processors that can expand the maximum main memory capacity of those systems to 16M bytes.

Available in memory configurations ranging from 1M to 16M bytes, the LCM-400 is reportedly identical to the memory expansions available from IBM. The vendor claims that by extending the main memory capacity of the 4331, 4341 and 4361 processors beyond the IBM maximum, users can avoid upgrading their systems to larger IBM processor models.

The LCM-400 memory costs roughly $6,000 per 1M byte in small memory configurations, such as 2M bytes. When pur-

See LOCOM page 81

IPL Systems, Sorbus reach maintenance agreement

WALTHAM, Mass. — IPL Systems, Inc., a manufacturer of a line of mid-range processors that is compatible with IBM's 4300 series processors, recently announced it will use the Sorbus Division of Management Assistance, Inc. to provide maintenance on IPL systems.

Under the agreement, Sorbus will maintain all domestically installed IPL processors. Further, IPL's maintenance technicians have been transferred to Sorbus. IPL said it is training Sorbus employees to maintain IPL systems.

While Sorbus will provide local customer service, IPL said it still retains full responsibility for the performance of its products. IPL will continue to maintain its remote diagnostic facility at its headquar-

Report predicts '84 sales of computer systems to hit $52.5 billion

By Edward Warner
CW Staff

WELLESLEY, Mass. — Total sales of the American computer industry will reach $92.4 billion this year, an increase of almost 16% over 1983, according to a report released by Venture Development Corp., an industry consulting firm here.

The lion's share of those sales, $52.5 billion, will go to the manufacturers of computer systems, an increase of $6.1 billion over last year, the report said.

The report, which provides sales projections for 40 categories of computers and computer industry products produced in the U.S., is based on personal interviews with executives from American computer manufacturers and roughly 500 questionnaires returned by computer product users, said Mark Rudov, a Venture Development senior consultant.

Other market segments covered by the report were data storage systems sales, expected to rise $2.1 billion over last year to a total of $12.7 billion, and sales of terminals, which will rise to $7.3 billion from $6.5 billion last year. The sales of printers and plotters, the report said, will rise by roughly $1 billion, from $7.3 billion in 1983 to $8.5 billion this year.

Software and services, meanwhile, will rise $2 billion in sales from 1983 to $11.7 billion this year.

In all, the industry is expected this year to continue its 15.9% annual growth rate since 1980, the report said. That rate, Rudov estimated, will be sustained "at least until the end of the decade," due to what he called the failure of most firms to adopt the efficiencies of office automation.

Mirroring that annual industry growth rate is the annual growth rate since 1980 in the sales of printers and plotters, the report said. The report pegged that rate at 16.4% and noted that strong growth in that industry was being shown by line printer shipments, with an annual rate of 15%, and page printers, with an annual rate of 14.6%.

Page printer shipments, the report predicted, will reach nearly $500 million this year, with the average selling price dropping nearly 50% from its 1980 level to around $130,000. That price, Rudov estimated, is probably not likely to continue its steep plunge because a point will come where "you won't attract more customers with a lower price."

Another area seen undergoing rapid growth by the report was that of printer/plotter shipments. Booming at a compound annual rate of 33.7%, the report said, shipments of those units will more than triple their 1980 sales level to $525.1 million this year. That boom, Rudov explained, is likely due to the market's increased interest in graphics and the greater availability of graphics software.

Plotter shipments, the report said, are likely to rise to nearly $400 million this year, with the sale of flatbed plotters topping the list.

Most buyers of the report, titled "The U.S. Computer Industry, Second Edition," will be U.S. manufacturers of computers, peripherals and software, Rudov noted. "They'll use it," he said, "to give themselves a better handle on where their industry is going."

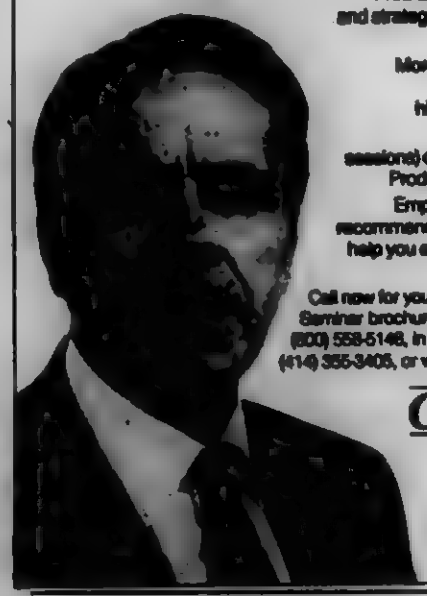
The 200-page, hardbound report is available for $1,050 from Venture Development, One Washington St., Wellesley, Mass. 02181.

CAP GEMINI DASD Presents

LAMOND ON IBM

San Francisco
The Westin Miyako
May 2–4, 1984

Washington, DC
The Sheraton International
Conference Center
May 7–9, 1984



Fred Lamond, internationally esteemed researcher and strategic-planning authority, thinks and speaks IBM. From the user's perspective.

More than 2,500 DP decision makers in 19 cities worldwide have already profited from his insightful and constructive analysis of IBM.

Lamond's intensive three-day seminar (12 sessions) discusses current and projected IBM policies. Products. Applications. Trends (including IBM PC).

Emphasis is on cost-effective alternatives to IBM recommended growth and migration paths. Designed to help you examine options and reduce the cost of doing business with Big Blue.

Call now for your free Seminar brochure, (800) 558-5148, in Wisconsin (414) 355-3405, or write:

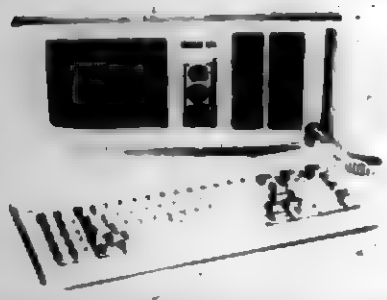
In NJ 609-235-4210



Introducing the **Eagle Spirit XL** from Data Access Systems, Inc., a portable with the power of many desktops, including the IBM XT.

Along with its high degree of IBM compatibility, the Spirit has a memory expandable to 640K bytes, two serial and one parallel port, a 10M byte hard disk, built-in graphics and more!

So if you're looking for quality and power in a portable computer, look for the Eagle Spirit XL from DASI, the leader in quality data communication products.

DASI sells, leases and services to the corporate user from an extensive inventory of PC's, CRT's, printers and modems. Its nationwide service locations give you same day on-site service. And with its multi-million dollar leasing base, DASI will tailor a financial package to meet any budget.

SYSTEMS & PERIPHERALS

DATA STORAGE

AVIV CORP.
Maxfile series

Aviv Corp. has introduced a family of plug-compatible storage systems for selected Digital Equipment Corp. Massbus, Unibus and Q-bus-based processors.

The Maxfile series reportedly features storage peripherals from Control Data Corp., Cipher Data Products, Inc. and Fujitsu Ltd. packaged in a 42-in. cabinet. Disk selections include both fixed and removable media, with data transfer rates of up to 1.8M byte/sec and storage capacities ranging from 80M to over 2G byte/cabinet.

Tape selections include front- and top-loading units with streaming and start/stop capabilities. Phase-encoded (1,600 bit/in.) recording is available for file transfer and software distribution, and group-encoded recording (6,250 bit/in.) is used for high-speed backup of large files, the vendor said.

The Maxfile series is available in six configurations, and prices start at $6,500, a spokeswoman said.

Aviv, 26 Cummings Park, Woburn, Mass. 01801.

PRINTERS/PLOTTERS

DIGITAL MATRIX CORP.
Formwriter 9/132

Digital Matrix Corp. has announced a 132-col. dot matrix forms printer designed for uses where multipart, continuous forms are printed individually or in the demand-document mode.

The Formwriter 9/132 performs like a journal printer, requiring no special programming or instruction codes for normal operation, according to the company.

It reportedly eliminates manual alignment of forms in order to print single documents such as prenumbered forms or checks. Depressing the tear-form button advances the paper so that either the last line printed or the head-of-form is brought to the tear bar for separation, while releasing the button returns the head-of-form to the print head and allows printing within ½ in. of the top or bottom of the sheet, according to the company.

The printer was designed for sale through OEMs, systems houses and distributors.

Evaluation units are available now for $1,595.

Digital Matrix, 106 Filley St., Bloomfield, Conn. 06002.

DIGITAL EQUIPMENT CORP.
LN01 Font Utility; LN01 Soft Font Library

Digital Equipment Corp. has announced enhancements designed to let users of its LN01 laser printer select from a variety of mono-spaced and proportionally spaced typefaces.

The LN01 Font Utility and the LN01 Soft Font Library are intended to help LN01 laser printer and VAX-11 superminicomputer users produce professional-quality printing in the office without typesetting equipment.

The LN01 Font Utility reportedly provides access to any type font — typeface, size or weight — from the LN01 Soft Font Library. The utility is said to describe available fonts, print a text file using a specific font or series of fonts or preload the LN01 printer with the fonts to be used for the day's printing.

Editing features reportedly create new characters or modification of characters for special usage, such as bullets for reports and presentations, compound characters or character combinations for building unique symbols or logos.

The utility runs under DEC's VMS operating system on the VAX-11/730, 750, 780 and 782 systems that include the LN01 printer and have 256K bytes of random-access memory.

The LN01 Soft Font Library reportedly comprises widely used proportional and mono-space type families in various sizes and weights. Type sizes are said to range from six to 36 points. Most type families reportedly feature a multinational character set.

The company reported that several packages, such as basic office, office upgrade and complete office are scheduled to be available in March. Other packages are designed for printing directories, listings, technical papers, newsletters, management reports and catalogs.

Prices for the LN01 Soft Font Library range from $1,025 to $1,350. The LN01 Font Utility is priced at $2,000.

DEC, Maynard, Mass. 01754.

GRAPHICS SYSTEMS

LYNXYS, INC.
Lynxystem 1000

Lynxys, Inc. has announced a hardware and software system designed to allow attachment of interactive graphics devices to Control Data Corp. Cyber 170 mainframes.

Lynxystem 1000 reportedly improves the performance of highly interactive applications by offloading the user interface portion of an application from the mainframe. The system's multiple microcomputers act as dedicated, programmable controllers for interactive graphics devices that traditionally cannot be connected to the mainframe, the vendor said.

The system is based on a high-speed bus with a Cyber 170 channel interface. Depending upon the configuration, the bus may use from two to five single-board Motorola, Inc. 68000-based microcomputers, each including 128K bytes of dual-ported memory, two serial ports and an I/O expansion bus to which multiple parallel ports may be attached.

Device adapters attach to the expansion bus to accommodate graphics and other peripheral devices.

The minimum configuration, the Lynxystem 1002, is priced at about $25,000, including software.

Lynxys, P.O. Box E, West Lafayette, Ind. 47906.

POWER SUPPLIES

NOVA ELECTRIC MANUFACTURING CO.
Minitaur UPS

Nova Electric Manufacturing Co.

Continued on page 80

SYSTEMS & PERIPHERALS

Continued from page 76

has introduced its 1-kVA Mintaur uninterruptible power system (UPS) with batteries and a ¼-cycle transfer switch in a 7-in.-high module.

The Mintaur UPS is designed for operation of a variety of equipment including microcomputers, communications equipment, CATV systems, word processors, point-of-sale terminals, process-control equipment and computer-aided design and manufacturing systems.

The system can operate at 150% of its 1-kVA rating for short time periods, the company said. In addition, for loads such as motors, disk drives or transformers, the system is said to provide up to 10 times overload through automatic operation of its static transfer switch. The switch returns to normal operation automatically when the overload condition has been overcome, according to the vendor.

The Mintaur handles I/O voltages ranging from 120 Vac to 240 Vac and has output frequencies of 60Hz and 50Hz. The Mintaur Model 11-1K60-Y11 is priced at $3,700.

Nova Electric Manufacturing, 263 Hillside Ave., Nutley, N.J. 07110.

LAMBDA ELECTRONICS
LT series

Lambda Electronics has announced a series of eight power supplies designed for use in laboratory, testing and systems applications.

The LT series reportedly provides up to 60V and up to 300A and comes with built-in overflow protection and dual, digital meter readout for voltage and current. The products are said to be compatible with Lambda's IEEE-488 standard, computer-programmable power system.

The power supplies are grouped in either the LT-800 series, with a 65% efficiency at maximum output voltage, or the LT-820 series, with a 70% efficiency at maximum output.

The LT-800 series is priced at $1,650, and the LT-820 series is priced at $2,900, the vendor said.

Lambda Electronics, 515 Broad Hollow Road, Melville, N.Y. 11747.

AUXILIARY EQUIPMENT

GOULD, INC.
884A-200

Gould, Inc. has announced an addition to the 884 family of programmable controllers used in small to mid-size control systems — the Model 884A-200.

With a 75% increase in memory size, the enhanced model is said to offer increased user logic storage capacity from 2,000 nodes to 3,500 nodes of relay ladder logic.

In addition, it reportedly provides for the storage of over 1K numerical qualities (registers) and an additional 1,024 on/off (discrete) variables, for a total memory capacity of nearly 5K 16-bit words. Comprised of a series of individual components, the 884A-200 permits the user to tailor the system to meet specific needs, the vendor said.

Basic features include battery back-up for the Cmos random-access memory, a memory-protect switch and a low battery power indicator.

The 884A-200 is priced under $2,000.

Gould, P.O. Box 3083, Andover, Mass. 01810.

APPLIED COMMUNICATIONS, INC.
Base24-Stratus

Applied Communications, Inc. has announced that its Base24-ATM processing and switching software is now available for the Stratus Computer, Inc. Stratus/32 Continuous Processing System.

The Base24/Stratus system was designed for use by financial institutions requiring medium or small automated teller machine networks, according to the vendor.

Base24-ATM reportedly enables institutions to choose from three authorization procedures, allowing flexibility within shared electronic fund transfer environments.

It also is said to include a settlement and reporting module that shows the funds due each day among sharing institutions.

Prices for Base24-ATM start at $145,000.

Applied Communications, 306 S. 108th Ave., Omaha, Neb. 68154.

PRO-LOG CORP.
Price reductions

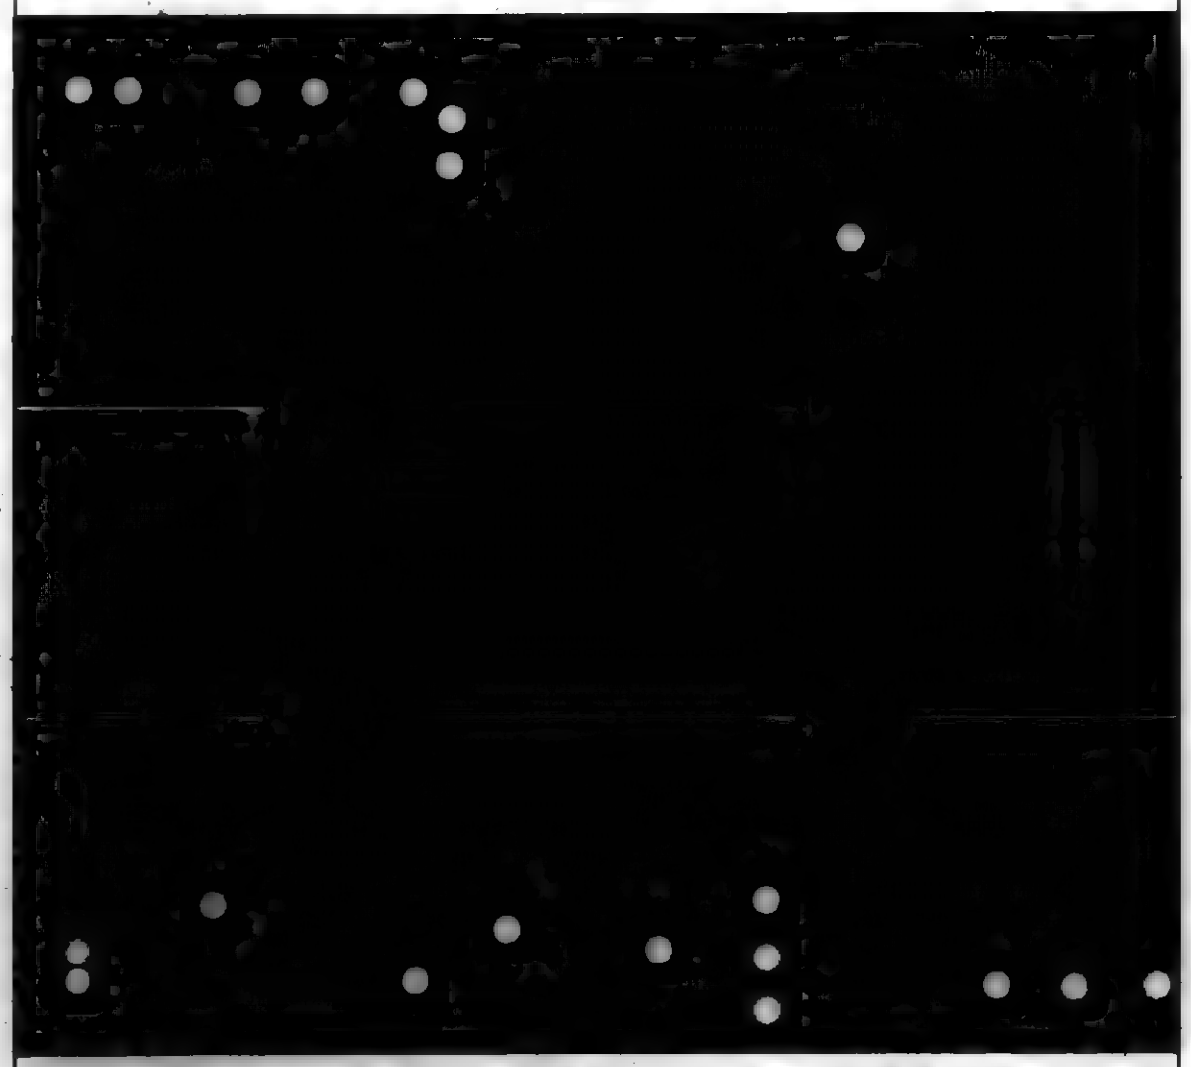
Pro-Log Corp. has announced price reductions of up to 34% on its line of programmable read-only memory programmer products. The price cuts go into effect immediately.

Pro-Log's M980 is a portable control unit designed to use any Pro-Log plug-in personality module.

Prices for the M980 have been cut

Continued on page 81

TIME



Making yourself memorable.

You don't have to be a giant in the industry to attain a leadership position. Just having your name among the leaders can make a noticeable difference.

Your advertising presence in TIME Magazine can do more than gain you the attention and interest of the business community. It can position you among the major companies who already know the value of reaching greater numbers of purchasing influentials with greater visibility.

TIME's audience offers you both selectivity and reach – with the right demographic and geographic patterns for increasing your share of market as well as building awareness within the business and financial communities, and among your dealers. Being in the world's foremost news magazine puts you in the main arena. And TIME has specific demographic and geographic editions to accommodate your budget and implement your marketing strategy.

Your reputation is probably the most important element in your continued growth. Now that you're making a name for yourself in the industry, perhaps it's time to make more of your name.

To learn more about how you can use TIME and its various editions, call Charles Craig at (212) 841-2831.

TIME

Get more out of it.

©1984 Time Inc.

"How many times have I told you not to stop the tape drive with your hand?"

SYSTEMS & PERIPHERALS

Continued from page 66

from $2,350 to $1,650 for the 8K-byte version, from $2,800 to $1,950 for the 16K-byte version and from $3,400 to $2,250 for the 32K-byte version.

The PM9060 Universal Metallic Oxide Semiconductor Personality Module is said to support all five-volt metallic oxide semiconductor Proms and microcomputers. Its price has been reduced from $1,900 to $1,450.

The System 90 includes an M990 control unit, a PM9069 module, a 28-80S pin-out adaptor, an M304 adaptor for RS-232 communication and a carrying case. Its price has been cut from $3,500 to $2,690 for 8K bytes, $3,800 to $2,890 for 16K bytes and $4,200 to $3,290 for 32K bytes, according to the vendor.

Pro-Log, 2411 Garden Road, Monterey, Calif. 93940.

TECHTRAN INDUSTRIES, INC.
TR-4 Transaction Recorder

Techtran Industries, Inc. has announced a retail management system designed to record sales transactions as they are generated by cashiers.

The TR-4 Transaction Recorder reportedly connects to standard electronic cash registers and records up to 9,600 15-char. lines on each cassette.

Individual recorders in a single- or multiple-store environment can be linked to a central processor or service bureau by telecommunications lines. The unit is said to allow a retailer to process data immediately at a central site, according to the company. The product also is said to allow retailers to hand-carry or mail cassettes to the data processing center if speed is less critical.

The TR-4 is available now for $1,125.

Techtran Industries, 200 Commerce Drive, Rochester, N.Y. 14623.

COMPUSCAN, INC.
Alphaword Series 80

Compuscan, Inc. has introduced its Alphaword Series 80 page readers, a group of three optical character readers that convert typewritten characters to electronic signals and transmit them to word processors, computers, communications systems and typewriters.

All three models reportedly feature automatic formatting for word processing applications and were designed for users with low-to-moderate input requirements. Models A and B of the series are said to scan 145 pages an hour. Model C can reportedly scan 250 pages an hour.

The three models claim an accuracy rate of less than one substitution error in 300,000 characters and include self-diagnostics and an operator message display and menu, the vendor said.

Prices in the Alphaword Series 80 line begin at $9,990 for the Model A, $10,990 for the Model B and $13,990 for the Model C.

Compuscan, Building 2, 81 Two Bridges Road, Fairfield, N.J. 07006.

PROFESSIONALS UNLIMITED
"Insights into IBM System/36"

Professionals Unlimited has announced the release of a text written for DP personnel who either have or are considering the acquisition of an IBM System/36.

"Insights into IBM System/36" reportedly provides a technical education and performance tips for those who have an IBM System/36 and offers an independent appraisal of the system's features for those considering a move to the System/36.

The text was written by David Greenblatt, a System/36 consultant and president of DGC, Inc. It costs $95.

Professionals Unlimited, 9851 Lantern Drive, Silver Spring, Md. 20902.

IPL from page 75

ters here, and IPL representatives have been placed in regional posts.

IPL said the move will allow it to offer its systems in more markets; it currently markets them in 13 domestic locations. IPL is located at 360 Second Ave., Waltham, Mass. 02154.

LOCOM from page 75

chased in larger increments, the cost is $4,000. A 16M-byte configuration costs $64,000. Locom is at 2350 Bering Drive, San Jose, Calif. 95131.

GOULD from page 75

al processor and also includes a color graphics terminal and graphics processor, the vendor said.

The two CAD/CAM systems offer the same basic functionality; however, the PS5100 offers more performance and expansion capability. The PS5100 offers the capability of adding a second terminal and is recommended for users who need extensive modeling capabilities, according to the vendor. The less powerful PS3100 is recommended for drafting applications. Both systems use a mechanical CAD/CAM package acquired by Gould, but developed by Vulcan Software, Inc.

Available in July, the PS3100 costs $69,900, including a PS3000 processor, graphics processor, the UTX/32 operating system and a drafting software package. A similarly configured PS5100 costs $115,000. A dual-user PS5100 system with a solids modeling package is priced from $152,500.

Additional information is available from Gould, which can be reached through 6901 W. Sunrise Blvd., P.O. Box 9148, Fort Lauderdale, Fla. 33310.

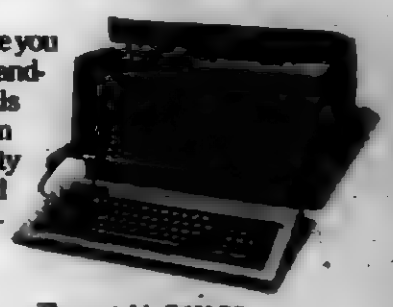
Go beyond equipment compatibility.
Reach for total performance.

The Zenith Z-100 PC's.

The Z-150 PC

In the white heat of the slalom, something clicks: skier and skis meld into one, and hurtle toward total performance. And, in your office, you'll experience that same kind of oneness with our new IBM-compatible Zenith PC's.

Their enhanced features actually take you beyond IBM compatibility. Like internal expandibility that allows you to add peripherals without adding size. Storage that can expand up to 11 megabytes. The ability to run virtually all software designed for the IBM PC. And a detached keyboard with a "smarter" key layout for added convenience.



The portable Z-160 PC

MICROCOMPUTERS

Paul Gillin
CW Senior Editor

How biased are micro reviews?

Nearly everyone trusts *Consumer Reports* because it goes to great lengths to emphasize its impartiality. But do microcomputer magazines that publish software reviews merit the same confidence?

Generally not. While there are several good, impartial publications out there that take special pains to present unbiased evaluations, the waters are full of sharks, according to computer magazine editors interviewed recently. They emphasized that it's important to get to know the publication before taking its software reviews too seriously.

The major problem is that, unlike *Consumer Reports*, most micro magazines rely on advertising for their livelihood. Conflict of interest may color product reviews.

"A lot of magazines are reluctant to knock a major advertiser," said Stan Veit, editor-in-chief of *Computer Shopper*. "And I think I see more of it in the larger publications."

"Only a very few will publish bad reviews," said Stewart Alsop Jr., editor of *Infoworld*. "We have lots of fears of it, but we do it. And we've lost ads because of it."

Unfortunately, choosing a reliable source for evaluations is no simple task. Alsop pointed out that many publications list new products and their functions in a format that resembles a review in form but not in content. Others simply don't publish bad reviews at all.

List magazine editor Ted Leonsis warned further that the perspective of an "expert" reviewer is often dramati-

Large firms want IBM logo

Compatibles not garnering large business mart

By Paul Gillin
CW Staff

Large companies shopping for microcomputers are more interested in the IBM logo than IBM compatibility, according to vendors, analysts and retailers interviewed recently by *Computerworld*.

Only one manufacturer of IBM-compatible micros, Compaq Computer Corp., garnered a significant percentage of the microcomputer market in 1983, according to Future Computing, Inc., a market research firm in Richardson, Texas. Corporate purchases made up a significant part of Compaq's sales. "Most of our computers were sold to large companies," said Ken Price, director of corporate communications at Compaq.

Corporate sales comprise a small percentage of other compatible manufacturers' revenues. "Volume sales to large companies are a small part of our business," said one retailer who carries Columbia Data Products, Inc. products. "Large companies look to the safe choice, the well-known name when they make a purchase."

"According to our studies, the IBM name is very important to MIS managers," said Dr. Harold Kiane, vice-president at Future Computing. "Because of its limited availability, compatible manufacturers were able to sell their products."

IBM's corporate dominance is shown in a Future Computing survey of 76 Fortune 1000 companies. Forty-four companies signed volume purchase contracts for IBM Personal Computers, four signed contracts for Apple Computer, Inc. microcomputers and three signed volume purchase agreements for both Digital Equipment Corp. and Hewlett-Packard Co. personal computers. None of the compatible manufacturers had signed corporations to volume purchaser agreements.

Compatible manufacturers acknowledge IBM's dominance. "It's obvious that IBM has set the predominant standard," said Jack White, vice-president of marketing and sales at Columbia Data of Colum-

HP continues charge into micro mart with debut of low-cost ink-jet printer

By Jeffry Beeler
CW West Coast Bureau

PALO ALTO, Calif. — Hewlett-Packard Co.'s drive to become a major force in the microcomputer field has entered its second phase, with the introduction of a thermal ink-jet printer that reportedly costs half as much as competing products offering comparable performance.

HP's 150 char./sec Think Jet printer made its debut during a recent press conference at which the company dropped a few hints about additional micro products slated for introduction later this year.

HP Executive Vice-President Paul Ely characterized the two upcoming products as companions for HP's existing Model 150 micro. "They will complement rather than replace the 150 and will be at least as important," he said during post-conference questioning.

The first of the anticipated micro offerings will appear in May and will be followed by a second such product approximately a month later. Ely also confirmed the existence of a portable HP micro that is already "well along in development" in the company's laboratories, he said. The HP portable, whose coming introduction has been rumored for some time, will reportedly have a notebook-size footprint and rival the power of the Model 150.

Credited with consuming about as much

The answer to program piracy: hardware protection

By John Herzf
Special to CW

When most people think of computer crime, they recall cases of theft, embezzlement and data leaks that have occurred by means of computer manipulation. There is, however, a much larger area of computer crime in our industry today: the piracy of computer programs.

Many people who would not consider stealing goods from a store have no qualms about stealing information from programs. In fact, it has become socially acceptable to copy and use software illegally. What can the developer do to protect his investment? The best method, I believe, lies in a hardware technique.

Copyright laws have been virtually useless in guarding software. To date, there has been no clearly successful copyright infringement suit because the problems are overwhelming. First, the program's developer must find the illegal copies. This is monumentally difficult in the sea of software in use today. Even if the author thinks he has found a copy, it's hard to prove it. Just because a package does the same thing as another doesn't prove it's written exactly the same way. And even if the software developer can unquestionably establish piracy, it is unlikely that a settlement will enable him to recoup his legal costs.

Like copyright laws, other legal means of protecting software are very hazy. Contracts and licenses have been devised to intimidate would-be pirates and aid in their prosecution. It is not clear, however, to what extent such schemes can be enforced.

"Public domain" is also a problem. Because knowledge cannot be owned, a developer must guard the source listings for his programs. If they are released, the programs are in danger of becoming public property. Lawyers are advising clients on the correct messages to include in their packages in order to prevent this. Unfortunately, no two lawyers seem to have the same opinion.

Software developers have invested a number of in-house software and hardware schemes to secure their software. There are, however, two major traps in this. First, there are many computer whiz kids who regard the breach of any system as a challenge. And any system designed by a human is probably breakable by another human. The other danger is that the cost or complexity of the system will become a barrier to successful marketing.

One notable example of a protection system being too complex to be effective is copy-proof formats. These formats involve an obscure way of putting data on the disk, which would interfere with the standard copy program used by an unauthorized user. The major problem with this, however, is that copying is also difficult or impossible for the legal customer, making backup very costly. And copy-proof programs are not unbreakable. The programs must be readable in order to be read into memory for operating. Hence, they are accessible to a special copy program.

Some copy-proof programs also suffer from a "weak link" problem. Often a program has been made copy-proof and accessible at the same time. The pirate simply prints the program out on paper and keys it into another system.

Another protection method is serialization. Unused information, written into the middle of the program, allows tracing to the person who bought the copy. The idea is to intimidate buyers so they will not allow their software to be copied. This, however, is one of the technique's major failings. It is very hard to prove that the buyer allowed his

MICROCOMPUTERS

Forecasting, planning tool fits IBM Personal Computer

BURLINGTON, Mass. — Alpha Software Corp. has introduced its Econometric Software Package (ESP), a forecasting and planning tool designed for the IBM Personal Computer and compatibles.

According to the vendor, ESP allows the Personal Computer user to integrate, in a single program, full-functioned econometric and statistical analyses with graphics, data management and the ease-of-use of a personal computer.

The interactive, screen-oriented package allows the user to collect, store and display historical data, compute a wide range of statistics and apply a full complement of regression techniques to estimate models and generate forecasts.

ESP requires 256K bytes of random-access memory and two double-sided disk drives. It runs under IBM's PC-DOS 1.1 or 2.0 and supports all hard disks and the Intel Corp. 8087 co-processor. A dot matrix graphics printer is needed to obtain a hard copy of ESP results, the company said.

ESP is priced at $795.

Alpha Software is located at 30 B St., Burlington, Mass. 01803.

Data base management system uses entity-relationship model

OTTAWA — Xanthe Information, Inc. has introduced XIM, a data base management system that reportedly uses an entity-relationship data model.

An entity-relationship model is an extension to relational data models, according to a spokesman for the vendor.

Data dictionary, data maintenance language, query language, report writer and a user-designed forms facility are reportedly integrated into one package.

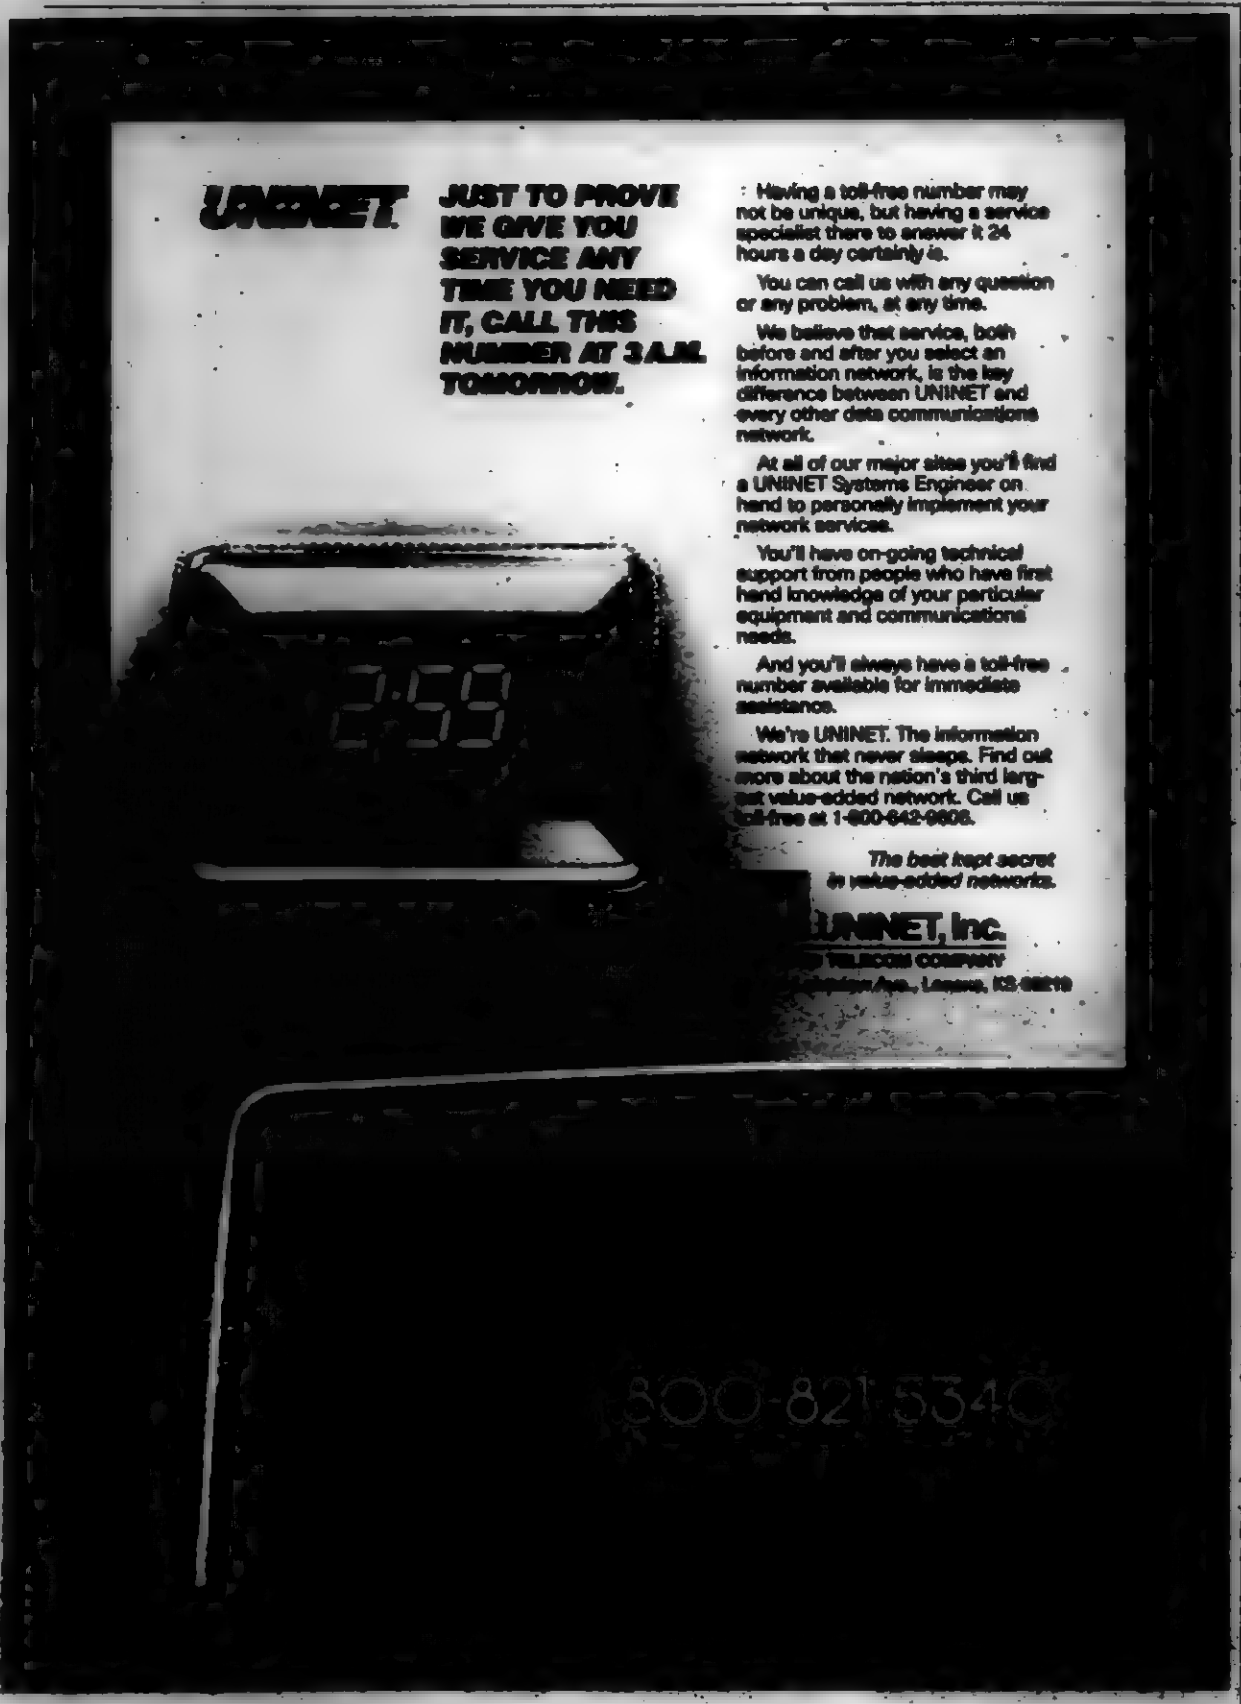
Applications are syntactically and structurally integrated, and there are no boundaries between applications, according to the vendor.

XIM reportedly handles text and numerical and graphics data.

There are two versions of the program: one runs under Microsoft, Inc.'s MS-DOS operating system and costs $1,000.

The second version runs under Quantum Software Systems Ltd.'s QNX, a Unix look-alike operating system, and costs $1,500, according to the vendor.

Xanthe Information is located at 1785 Woodward Drive, Ottawa, Ontario K2C 0R1.



SYSTEMS

TEXAS MICROSYSTEMS, INC. TMI-IPC

Texas Microsystems, Inc. (TMI) has introduced a rack-mounted computer with shock-mounted components that is designed for industrial use. The unit is said to be compatible with the IBM Personal Computer.

The product, the TMI-IPC (Industrial Personal Computer), also features shock-mounted disk drives, a key-lock power switch for system security and an optional backup battery pack. It reportedly can tolerate up to 80% humidity and runs the following operating systems: Microsoft, Inc.'s MS-DOS; Digital Research, Inc.'s CP/M-86 and Concurrent CP/M-86; and Intel Corp.'s RMX 86.

The basic configuration, including the CPU, one diskette drive and a keyboard, is available for $3,595.

TMI, 8330 Sterling St., Irving, Texas 75063.

STORAGE

DRAGON INDUSTRIES SP-65; SP-140

Dragon Industries has introduced a line of 65M-byte and 140M-byte hard disk systems for the IBM Personal Computer, Personal Computer XT and compatibles.

According to the vendor, the new line features a 30 msec average access time and 8 msec track-to-track, with 60 msec maximum, including settling.

Compatible with the IBM PC-DOS and Microsoft, Inc. MS-DOS 1.1 and 2.0 operating systems, the system is offered in two models: the SP-65 and SP-140, offering 65M-byte and 140M-byte storage, respectively.

The SP-65 is priced at $4,995; the SP-140 is $6,995.

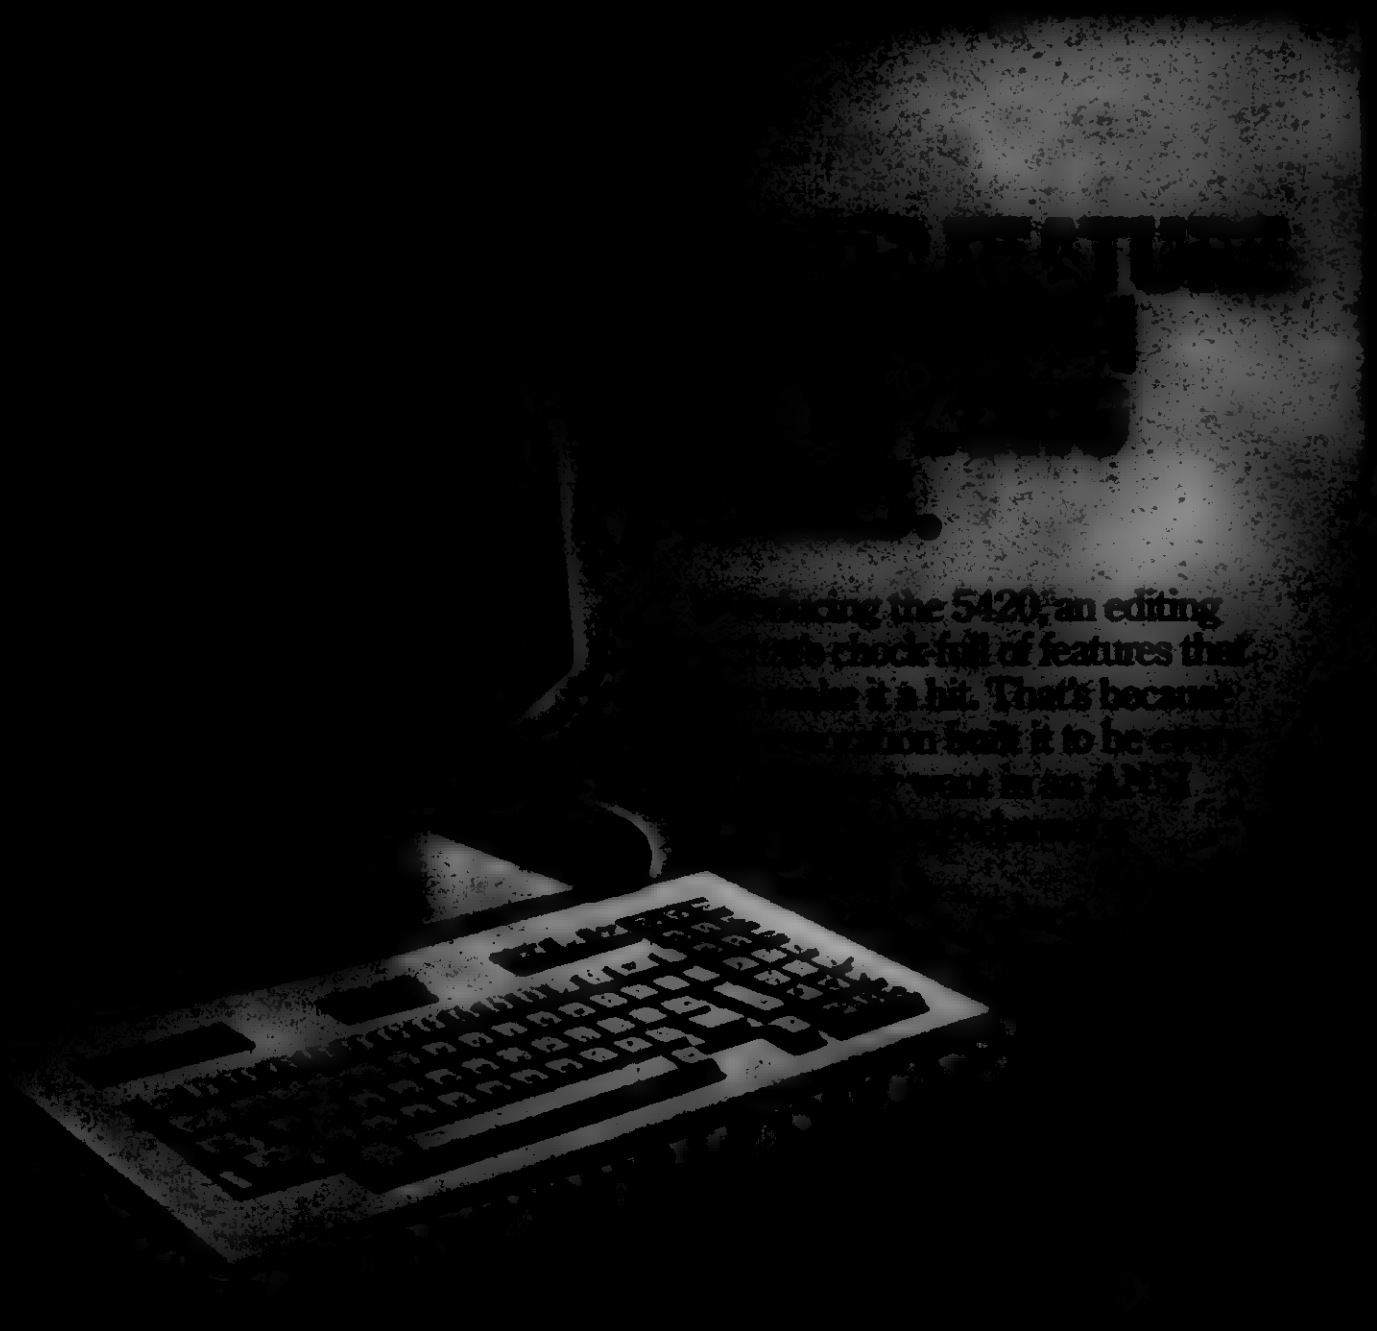
Dragon Industries, 36 Main St., Hopkinton, Mass. 01748.

BOARD-LEVEL DEVICES

APPLIED CREATIVE TECHNOLOGY, INC. Printer Optimizer

Applied Creative Technology, Inc. has announced the Printer Optimizer, an electronic printer speeder for microcomputer users.

Continued on page 86



For years, Digital's VT100 terminal has been the CRT to choose if you want the most out of your computer. It has become the industry standard for reliability and ease of use. Not to mention the largest selling ASCII terminal in the world.

Now Digital advances this standard with the VT220 family.

Terminals and terminals that embody everything Digital has learned about how to make people

MICROCOMPUTERS

Continued from page 84

The Printer Optimizer is a hardware device that physically connects between a computer and one or more printers. According to the company, it provides separation of computer and printer functions and gives the operator control over the order in which jobs are printed, stopping for paper changes when necessary.

The Printer Optimizer can act as a liaison between any mix of computer system and several printers, regardless of whether they are electronically and code-compatible, the company noted. The spooler can translate English language into foreign characters, provide access to a dot matrix printer's various type fonts and colors and create graphics.

The Printer Optimizer can also be used with a modem as a stand-alone data receiver or transmitter. Storage capacity is expandable from 64K bytes to 256K bytes.

The Printer Optimizer costs $499.

Applied Creative Technology, 9156 W. Northwest Highway C-303, Dallas, Texas 75220.

DATRICON CORP.
ACS-2A

Datricon Corp. has introduced an STD-bus microcomputer called the ACS-2A. The Zilog, Inc. Z80-based single-board computer is compatible with the Mostek, Inc. CPU-2A, using the same configuration areas and mapping read-only memory, but with several enhancements to decrease cost and increase reliability, the company claimed.

The ACS-2A has six 28-pin, byte-wide sockets, increasing on-board memory to 128K bytes. Memory expansion through the STD-bus Memex line is supported with a hardware memory management system compatible with Digital Research, Inc.'s CP/M 3.0. Expanded I/O is also supported.

Prices are $195, $235 and $260 for the 2.5, 4 and 6 MHz versions.

Datricon, Box 488, 155B Ave., Lake Oswego, Ore. 97034.

AUXILIARY EQUIPMENT

TOPAZ, INC.
Powermaker Micro UPS

Topaz, Inc. has introduced an uninterruptible power supply for microcomputers. The unit, called Powermaker Micro UPS, is said to provide up to 75 minutes of sine-wave ac power in the event of a blackout and also reportedly protects against voltage sags and brownouts.

Powermaker Micro UPS fits underneath the workstation and reportedly includes a line-loss alarm to warn when the unit has switched to battery power.

The power supply is available in models with power ratings of 400, 800 or 1,000 Vac, priced at $750, $890 and $995, respectively.

Topaz, 3855 Ruffin Road, San Diego, Calif. 92123.

IMAGING TECHNOLOGY, INC.
PC Vision Frame Grabber

Imaging Technology, Inc. has announced the PC Vision Frame Grabber, a real-time, video image acquisition and display module for the IBM Personal Computer and Personal Computer XT.

According to the vendor, the product includes a hardware module that plugs directly into an expansion slot in the IBM Personal Computer, software routines, documentation and all required interconnecting cables.

The Frame Grabber converts a camera's RS-170 analog video signal to digital data at a 10-MHz rate and stores the resulting data in an on-board frame memory, the company said.

The Frame Grabber is priced at $2,995.

Imaging Technology, 600 W. Cummings Park, Woburn, Mass. 01801.

TOPAZ, INC.
Line 2 Power Conditioners

Topaz, Inc. has introduced a series of single-phase power conditioners featuring an internal microcomputer that reportedly monitors and corrects fluctuations in voltage.

The Line 2 Power Conditioners are said to have a narrow output-voltage-regulation band, a shielded internal noise suppressor and operating frequencies of 50Hz and 60Hz.

They come in several power ratings and prices. The ½ kVA model costs $430; the 1 kVA model, $545; the 2 kVA model, $925; the 3 kVA model, $1,385; the 5 kVA model, $2,380; the 7½ kVA model, $3,110; and the 10 kVA model, $4,090.

Topaz, 3855 Ruffin Road, San Diego, Calif. 92123.

SOFTWARE

FOX RESEARCH, INC.
10-Net compatibility

Fox Research, Inc. has announced that Sperry Corp.'s personal computer, the Sperry PC, can use Fox Research's 10-Net local-area network.

Each 10-Net network package reportedly includes all hardware, software and documentation needed to link an IBM Personal Computer, a Personal Computer XT or another compatible machine with other 10-Net-based microcomputers. 10-Net reportedly does not require any dedicated network server hardware and is said to feature several levels of data access authorization to ensure file security.

10-Net operates under IBM PC-DOS 2.0 and is available for $695.

You Can Read Some of the Dumps... Some of the Time...

In the past, programmers had to slave over monumental stacks of paper to resolve abends.

Trying to convert hexadecimal numbers like four score and seven or debating over where the abend occured was as tough as splitting logs.

But then was brought forth a new notion — Abend-AID. It was a great moment in dump history. Programmers were emancipated as the drudgery of solving abends was abolished. They were free to devote their time to more productive tasks.

Abend-AID transfers the burden of debugging from the programmer to the computer. Abend-AID output shows What Happened, When it Happened, Where it Happened and supplies the necessary supporting data in an easy-to-use format that can almost fit on the back of an envelope (10-12 pages, in English).

Abend-AID is available for both IBM OS and DOS installations. Listed below are unique Abend-AID options for your specific needs.

- ☐ **Abend-AID/COBOL** — The first practical source level debugging tool.
- ☐ **Abend-AID/SPF** — 80 column "easy-to-use" viewing capability which permits programmers to interactively debug abends at their terminals.
- ☐ **Abend-AID/ONLINE** — 80 column CRT output for easy viewing.
- ☐ **Abend-AID/DOS/DLI & Abend-AID/OS/IMS** — Features special diagnostic routines for IBM's data base systems.

Free Abend-AID Product Evaluation.

For additional product information, or to arrange for your 30-day FREE evaluation of Abend-AID, just give us a call at 800-521-9353 (in Canada or Michigan, 313-540-0400), or clip your business card to this ad and mail it to: Compuware, Systems Software Division, 32100 Telegraph Road, Birmingham, Michigan 48010.

Abend-AID. The civil way to address program abends and cancels.

Fox Research, 7005 Corporate Way, Dayton, Ohio 45459.

SOFTCRAFT, INC.
Btrieve Release 3.0; Btrieve/N 3.0

Softcraft, Inc. has announced enhanced versions of the Btrieve and Btrieve/N file management and record retrieval systems for use with the IBM Personal Computer, Personal Computer XT and microcomputers that utilize Microsoft, Inc.'s MS-DOS. Btrieve/N is designed for use with local-area networks.

Enhancements include new file characteristics, a sorting capability, more efficient utilization of disk space and high-speed file-handling options, the company said. The new release includes a utility for converting existing Btrieve files to a format compatible with Btrieve 3.0. The added file characteristics enable keys to be defined as having multiple segments, allowing multilevel sorts to be built into a file.

The sorting capability is based on a new utility, B$index, which builds an external index for an existing file, providing a capability similar to a sort function.

Both systems include multikey access to records, an unlimited number of records per file, a variable cache buffer from 16K bytes to 64K bytes, error control and recovery within an application, automatic file recovery on system crash and duplicate and modifiable keys.

The 3.0 releases of Btrieve and Btrieve/N sell for $245 and $595, respectively.

Softcraft, P.O. Box 9802, No. 590, Austin, Texas 78766.

AUTOMATIC DATA PROCESSING, INC.
Datapath

Automatic Data Processing, Inc. (ADP) has announced an enhanced version of Datapath, its data-access software package designed for use with the Lotus Development Corp. Lotus 1-2-3 package on the IBM Personal Computer.

With Datapath, a Personal Computer user can link to ADP's central computing systems, which contain more than 35 financial, investment and economic data bases, both public and proprietary.

Datapath allows the user to screen the data bases, select the information needed and download it to the Personal Computer, a spokesman said.

The new version requires fewer steps for ad hoc data retrieval, features simpler error messages, allows unlimited retrieval of textual data and can be used with a wider range of modems, the company said.

For $235, a user receives one copy of Datapath, plus training and documentation. To purchase both Datapath and 1-2-3, as well as training and documentation for each, the cost is $690.

ADP, 175 Jackson Plaza, Ann Arbor, Mich. 48106.

MICROSOFT, INC.
Chart

Microsoft, Inc. has unveiled Chart, a graphics package for the IBM Personal Computer.

Using a menu-driven facility, Chart provides the user with eight types of charts and 45 chart formats, the vendor said. Tailoring capabilities allow users to move objects on a screen, highlight points on the chart and display 16 charts simultaneously. Users reportedly can choose segment and line patterns, font sizes and grid patterns, explode pie chart segments and rotate pies. The program reads Software Arts, Inc. Data Interchange Format or Ascii files.

Chart sells for $250.

Microsoft, 10700 Northup Way, Bellevue, Wash. 98004.

URGEO SOFTWARE, INC.
Apple-Bisync

Urgeo Software, Inc. has announced Apple-Bisync, a batch teleprocessing program for Apple Computer, Inc. Apple II and Apple IIe microcomputers.

The product allows the microcomputer to function as a workstation, the vendor said. Apple files can be transmitted into programs running under IBM's JES, RSCS environments. The program reportedly changes Ascii files to Ebcdic files. Options reportedly include record compression, truncation and blocking.

Apple-Bisync costs $950.

Urgeo Software, Box 353, Rt. 4, Cheney, Wash. 99004.

RUF CORP.
IMPRS

RUF Corp. has announced its Information Management Processing and Reporting System (IMPRS), which runs on Digital Equipment Corp. Professional 325 and 350 microcomputers.

IMPRS combines a data base management system, data manipulation language and a query language, the vendor said. IMPRS reportedly allows the user to develop ad hoc reports and design various reports that represent data in any manner. The program can use files generated on DEC minicomputers running IMPRS under DEC's RSTS/E or VAX/VM operating systems.

IMPRS for the Professional costs $1,500.

RUF, 1533 E. Spruce St., Olathe, Kan. 66061.

COME CELEBRATE WITH US!

FEDERAL DP EXPO

APRIL 17-19, 1984
WASHINGTON, D.C.
CONVENTION CENTER

Dear Federal Computer Professional:

We invite you to help us celebrate the 10th anniversary of FEDERAL DP EXPO and Conference on April 17-19, 1984 at The Washington D.C. Convention Center.

The thrust of this 1984 event, Washington's longest running computer exposition and conference, will address a topic of the most timely concern...

★ INTEGRATING DESKTOPS WITH MAINFRAMES.

Look at what else our 10th anniversary has in store for you:

★ Over 40 conference sessions tailored to your specific DP requirements including informal, interactive Box Lunch seminars where small groups will discuss topics of special interest with the experts.

★ A new, expanded Program Advisory Roundtable of 26 prominent government experts whose direct involvement includes the tailoring of, and participation in, the conference sessions.

★ A one-day program of special briefings and other activities for Federal procurement and purchasing managers.

★ Attractive, new, low conference rates for Federal employees, plus group discount rates when associations, organizations or departments of five or more people register together.

★ An even bigger, more active exhibit floor presenting displays from leading manufacturers of computer hardware, software, peripherals, systems and services.

No wonder the 10th Annual FEDERAL DP EXPO & Conference is expected to be Washington's best and most important computer show ever!

Come celebrate this newer, bigger, more exciting event with us! For more information, call (617) 449-6600 today.

We'll be looking for you at FEDERAL DP EXPO & Conference.

Cordially,

Sheldon G. Adelson
President, The Interface Group

MICROCOMPUTERS

Continued from page 89

introduced Nutshell, an information manager software package that enables microcomputer users to store and retrieve data in almost any format, to browse through stored information and to exchange data with word processors, spreadsheets and other programs, according to the vendor.

Nutshell was designed for the Leading Edge Personal Computer, Compaq Computer Corp.'s Compaq computer, the IBM Personal Computer and compatibles. It runs under IBM's PC-DOS revision 1.1 or 2.0 with 256K bytes of random-access memory and one double-density disk drive.

Nutshell is priced at $395.

Leading Edge Products, 55 Providence Highway, Norwood, Mass. 02062.

MICRO-CLEAR, INC.
Deecur

Micro-Clear, Inc. has introduced a security system called Deecur for the Ashton-Tate Dbase II data base management system.

The Deecur system reportedly provides two levels of security by requiring Dbase II users to enter both a password and an identification number when they use Dbase II. The system does not require Dbase II users to reenter their password and identification number as they access each Dbase II program, but can be used to restrict automatically certain users from some programs, according to the vendor.

The Deecur security system is available for $99, including documentation and installation instructions.

Micro-Clear, 342 Madison Ave., New York, N.Y. 10017.

SOFTWARE PRODUCTS INTERNATIONAL
Open Access

Software Products International (SPI) has released its integrated business management software package for the IBM Personal Computer and compatible systems.

Called Open Access, the package is built around a relational data base management system and offers word processing, spreadsheet, three-dimensional graphics, telecommunications and time management functions.

The relational data base allows the user to join elements of the five modules. All interaction with the information manager module is performed in English query language terms, the vendor claimed.

Open Access retails for $695.

SPI, 10240 Sorrento Valley Road, San Diego, Calif. 92121.

ITSOFTWARE
Showit; Mailit

ITSoftware, a division of Martin Marietta Data Systems, Inc., has added a document transfer program and a business graphics package to its IT series of microcomputer software for the IBM Personal Computer and compatible systems.

Showit, the business graphics package, provides a range of standard graphics features, including pie charts, bar charts and graphs, plus additional capabilities such as three-dimensional pie charts, pyramid charts and slide show preparation, according to the vendor.

Mailit is said to provide IBM 3270-type communications capabilities among Personal Computer users. Users can prepare memos, tables, schedules and other documents using programs in the IT series or other Personal Computer software and then transfer the documents to the mainframe, where they are available for downloading to selected recipients, the vendor said.

Both Mailit and Showit are menu-driven and offer on-line help and English error messages; the company claimed. Showit costs $350. Mailit is priced at $250, with volume discounts available.

ITSoftware, P.O. Box 2966, Princeton, N.J. 08540.

QUALITY INFORMATION SYSTEMS
Data Pull/Informaster

Quality Information Systems (QIS) has announced an add-on enhancement module for its Qtime Executive package.

The Data Pull/Informaster module, when used in conjunction with a file transfer program, enables the user to pull information from existing data sources and automatically reformat it into standard Qtime format, a spokesman said.

Qtime Executive is menu-driven and is designed for data tracking in office automation applications with RM/Cobol and operating systems such as Unix, Microsoft, Inc.'s MS-DOS, IBM's OS and Wang Laboratories, Inc.'s VS.

The module costs $95 and is available now.

QIS, Suite 205, 2001 Bayford Highway N.E., Atlanta, Ga. 30329.

HAWKEYE GRAFIX
EMM

Hawkeye Grafix has introduced its electronic mail manager (EMM), a software application program for coordination of communications between multiple business offices.

EMM provides facilities for management of a private electronic mail network in conjunction with Hawkeye Grafix's Comnex communications exchange software, according to the company.

EMM is written in Ashton-Tate's Dbase II. The full-screen menu editor allows preparation of memos for

broadcast to other mailbox destinations.

The introductory price of an EMM master/slave pair is $400. Each successive slave branch module costs $100.

Hawkeye Grafix, 23914 Mobile, Canoga Park, Calif. 91307.

PACIFIC BASIN GRAPHICS
PBG 200

Pacific Basin Graphics has introduced the PBG 200 business graphics package, a Unix-version menu-driven program that reportedly produces color and black-and-white data displays, including pie charts, stacked and clustered bar charts, three-dimensional bar charts as well as line graphs.

PBG 200 runs on Intel Corp. 8088- and Motorola, Inc. 68000-based computers and on Digital Equipment Corp. VAX-11 computers. The program supports more than 35 peripherals and can be adapted for a variety of configurations, the company said.

PBG 200 Business Graphics sells for $595. The Subroutine Library is priced at $995.

When purchased together, the total cost is $1,395, the vendor said.

Pacific Basin Graphics, Suite 5, 750 York St., San Francisco, Calif. 94110.

MORGAN COMPUTING CO., INC.
Professional Basic

Morgan Computing Co., Inc. has introduced a 16-bit version of Basic which, it claimed, can access the full memory of the IBM Personal Computer.

The new language, Professional Basic, is reportedly a window-oriented system of more than a dozen tracing and debugging screens, two of which can be displayed at a time. Users are said to be able to view changes in variables or array elements and in the progress of FOR/NEXT loops.

A syntax checking feature is also included, the vendor said.

Professional Basic for the IBM Personal Computer is written in assembler, requires 256K bytes of random-access memory and sells for $345, according to the vendor.

Morgan Computing, Suite 210, 10400 N. Central Expwy., Dallas, Texas 75231.

IT'S WHEN NO ONE KNOWS THERE'S BEEN ONE.

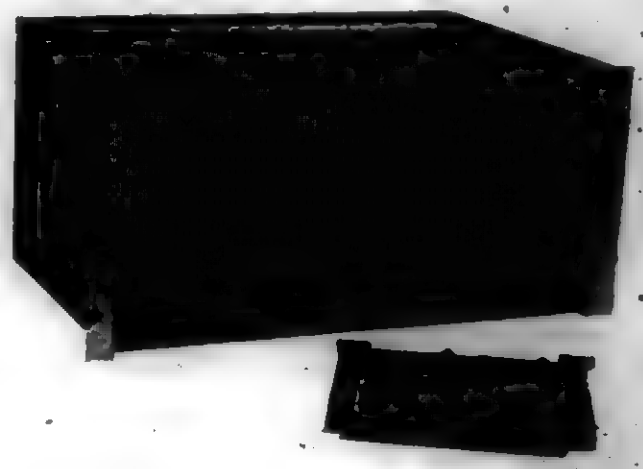
Computer crime is 10 times more profitable than robbing a bank. That's a fact. But, this statistic is only available on KNOWN computer crime... it's impossible to know how much monetary and informational theft goes undetected; some of it, perhaps, from your own system.

The ability to access computers via dial-up ports adds efficiency and reduces cost. But it creates a potential exposure akin to leaving the vault door unlocked. Disgruntled employees, strikers, malicious hackers and dishonest competitors can obtain information, vandalize the system, even misappropriate inventory... all from a push-button phone.

Now, this computer crime, fraud and abuse can be stopped. LeeMAH has a "lock" for your computer even the whiz kids can't crack... LeeMAH's Secure Access Systems, both the single port (SAU) and multi-port (SAM).

Both SAU and SAM reduce your system's vulnerability by allowing access to AUTHORIZED LOCATIONS ONLY via callback. This separate piece of hardware connects on the analog side between modem and telephone lines.

You can stop the perfect crime...: with LeeMAH's SAU and SAM.



LeeMAH 729 Filbert Street, San Francisco, CA 94133 • Telephone: (415) 434-3780

JETSOFT, INC.
Jet III

Jetsoft, Inc. has announced Jet III, an integrated application generator and data base manager.

A menu-driven program generator writes code for file maintenance, transaction processing and reporting, the vendor said. The package accommodates relational, hierarchical and network data base structures and integrates with Jetsoft's general ledger, payroll, accounts payable and accounts receivable modules.

The system runs under Digital Research, Inc.'s CP/M, Concurrent CP/M and MP/M operating systems, as well as Microsoft, Inc.'s MS-DOS operating system. A single copy of a six-user system costs $40,000.

Jetsoft, 170 Main St., East Falmouth, Mass. 02536.

PYRAMID DATA, LTD.
Number Cruncher updates

Pyramid Data, Ltd. has announced that its Number Cruncher software series now runs on Digital Equipment Corp.'s Rainbow; Eagle Computer, Inc.'s Eagle XL and Spirit; and Tandy Corp.'s Tandy 2000 microcomputers.

The Number Cruncher series consists of four programs: Number Cruncher I, Number Cruncher II, Number Cruncher III and Run Time. The series provides the user with a fourth-generation programming language that allows the user to develop software applications that meet his requirements, the vendor claimed.

Prices for individual programs range from $99.95 to $695.

Pyramid Data, P.O. Box 10116, Santa Ana, Calif. 92711.

SOFTECH MICROSYSTEMS, INC.
UCSD Pascal compiler; P-system; Insight Window Designer

Softech Microsystems, Inc. has introduced a bundled development package for the Digital Equipment Corp. Rainbow computer. Included in the package will be a UCSD Pascal compiler to permit programmers to write in UCSD Pascal.

Also included will be the firm's P-system, a portable microcomputer operating system, and Insight Window Designer, a windowing tool kit. The P-system reportedly was designed for text processing and application execution. The Insight program is said to provide windowing capabilities and enhancements for multiapplication integration.

The package is available for $399.

Softech Microsystems, 16885 W. Bernardo Drive, San Diego, Calif. 92127.

AES DATA CORP.
Office productivity software

AES Data Corp. has announced several new programs to run on its Savin 7100 Personal Work Station or its Savin 7200 Office Support System.

Inter-User Messaging, available as an option on the AES 7200, allows users to send messages to other users within a cluster system or on the AES Multi-Link network, according to the vendor. A spelling verification program, for both the 7100 and 7200, is said to provide a dictionary of thousands of common English words. The Operator Assist software, available at no cost as part of the 7200 system

Only Lee Data's Universal Terminal System can satisfy all of your information processing needs... 3270, Async and personal computing.

Finally, there's a single, universal way to satisfy the individual information processing needs of all your people. From sales manager to accountant. From research to production. The Lee Data Universal Terminal System can do it all.

And our system is modular by design to provide you any or all of these cost-effective, problem-solving advantages:

3270-compatibility *plus more*

Combine complete 3270 system-compatibility with an innovative Lee Data design and you have a System that delivers greater convenience and flexibility.

Our System not only offers standard 3274-compatible local and remote control units, but now also provides combination local/remote controllers with a unique dual-host access capability.

In addition, you can choose from a full line of terminal capabilities, beginning with our cost-effective 3178-compatible display on up to our popular All-In-One Display which offers, in a single unit, four selectable screen sizes—including 132-column—a great advantage in program development, spread sheet applications and many others where flexibility is required.

3270-plus-Async: another cost-effective advantage

If your application needs currently find you switching between 3270 and VT100-style terminals to get the job done, Lee Data has a better way.

As part of our System, you can enjoy the further advantage of a 3270/Async capability that allows dynamic selection of 3270 and VT100 operating modes from a single Lee Data display. A simple command entered at the keyboard provides you access to applications running on an IBM CPU, non-IBM systems (such as DEC, H-P or Prime), as well as timesharing services. Another Lee Data solution to simplifying your company's terminal network.

And now integrated personal computing too

That's right! Now our System also includes a sophisticated personal computing package that can easily be integrated into an existing Lee Data 3270 system.

With our approach, you get continued interactive access to host-based files, plus all the advantages of professional business computing from the same Lee Data workstation.

Advanced features include a host file transfer capability, a single-board design, four standard system expansion slots and, of course, complete IBM-compatibility.

All these additional capabilities plus the same user-friendly Lee Data displays.

Plus these added benefits...

To any Lee Data System, add our unique Coax Eliminator products and realize additional savings of up to 85% in cabling costs alone.

Combine this with all the outstanding features already mentioned and you'll find a System offering everything you need for efficient, cost-effective operation.

Discover the advantages of our Universal Terminal System for yourself. For more information, call our system specialists toll free:

only, reportedly presents instructions and assistance at the bottom of the display screen to aid users.

The Systems Activity Management software, available for both models, reportedly permits users to determine the burden on a system and the number of terminals in use. The Work Group Activity Management software, available for both models, allows work done on a terminal to be charged to specific account numbers, the vendor said.

Inter-Unit Messaging, Systems Activity Management and Work Group Management are priced at $500; the spelling verification program is available for $1,000.

AES Data, P.O. Box 10272, 9 W. Broad St., Stamford, Conn. 06904.

ALSPA COMPUTER, INC.
Add-Net

Alspa Computer, Inc. has introduced Add-Net, an interface and software package that allows Kaypro Computer Corp. Kaypro portables and Eagle Computer, Inc. Eagle 2 computers to plug into a high-speed local-area network.

According to the vendor, Add-Net allows personal computers to operate as intelligent workstations on an Alspa-Net local-area network, which provides electronic mail and access to other workstations, peripherals and software.

Alspa's CN-4001 network master costs $1,195; Muays Corp.'s Turbodos operating system costs $750. One master computer will support up to 255 workstations, with any mix of Alspa workstations or microcomputers, a spokesman said.

Add-Net, including software, is priced at $595.

Alspa Computer, 477 Division St., Campbell, Calif. 95008.

COMPUTING CAPABILITIES CORP.
Dual/150

Computing Capabilities Corp. has introduced the Dual/150, a program that allows a Hewlett-Packard Co. HP 150 touchscreen personal computer to operate simultaneously as two terminals connected to two different computers or communication lines.

According to the vendor, the program creates two independent work spaces within one HP 150 and connects each to one of the two RS-232 ports.

Each of the work spaces functions as a complete HP 150 terminal, providing both block and format mode capability, a spokesman said.

Dual/150 is priced at $295.

Computing Capabilities, Suite 223, 465-B Fairchild Drive, Mountain View, Calif. 94043.

MAG SOFTWARE, INC.
Mag/base formats

Mag Software, Inc. has announced that Mag/base, its family of data base management systems, is available in 14 new formats.

Some of the formats include the Altos Computer Systems, Inc. Altos 586; Eagle Computer, Inc. Eagle II and Eagle 1600; Hewlett-Packard Co. HP 87/125; Kaypro Computer Corp. Kaypro II; NCR Corp. 1st Step and Decision Mate; Osborne Computer Corp. Osborne DD; Sanyo Business Systems Corp. Sanyo 2000; Televideo, Inc. Televideo 802 and 1603; Toshiba Corp. T100; and Xerox Corp. 820.

All packages are available in IBM's PC-DOS; Microsoft, Inc.'s MS-DOS; and Digital Research, Inc.'s CP/M 80, CP/M 86, Concurrent CP/M 86 and MP/M 86. Prices are $295, $495 and $795 for Mag/base[1], Mag/base[2] and Mag/base[3], respectively. Upgrades from Mag/base[1] to Mag/base[2] are $200 and from Mag/base[2] to Mag/base[3], $300.

Mag Software, Suite 305, 21054 Sherman Way, Canoga Park, Calif. 91303.

MOSAIC SOFTWARE, INC.
Softplot/BGL enhancement

Mosaic Software, Inc. has released an enhanced version of Softplot/BGL, a device-independent graphics extension system that is said to allow users to create custom graphics applications in Basic.

According to Mosaic, Softplot provides two-dimensional viewing with windows, three-dimensional plotting, dashed and colored lines, image rotation and automatic text justification.

Another feature, Emuplot, is a general-purpose plotter emulator for dot matrix printers that reportedly can produce high-resolution graphics.

The package requires 64K bytes of memory and supports a variety of Digital Research, Inc. CP/M and Microsoft, Inc. MS-DOS systems with Microsoft's M-Basic. Programs may be transported from one CP/M or MS-DOS system to another without being rewritten, the company noted.

Softplot/BGL retails for $99.

Mosaic Software, 1972 Massachusetts Ave., Cambridge, Mass. 02140.

DIRECT.AID, INC.
Impersonator

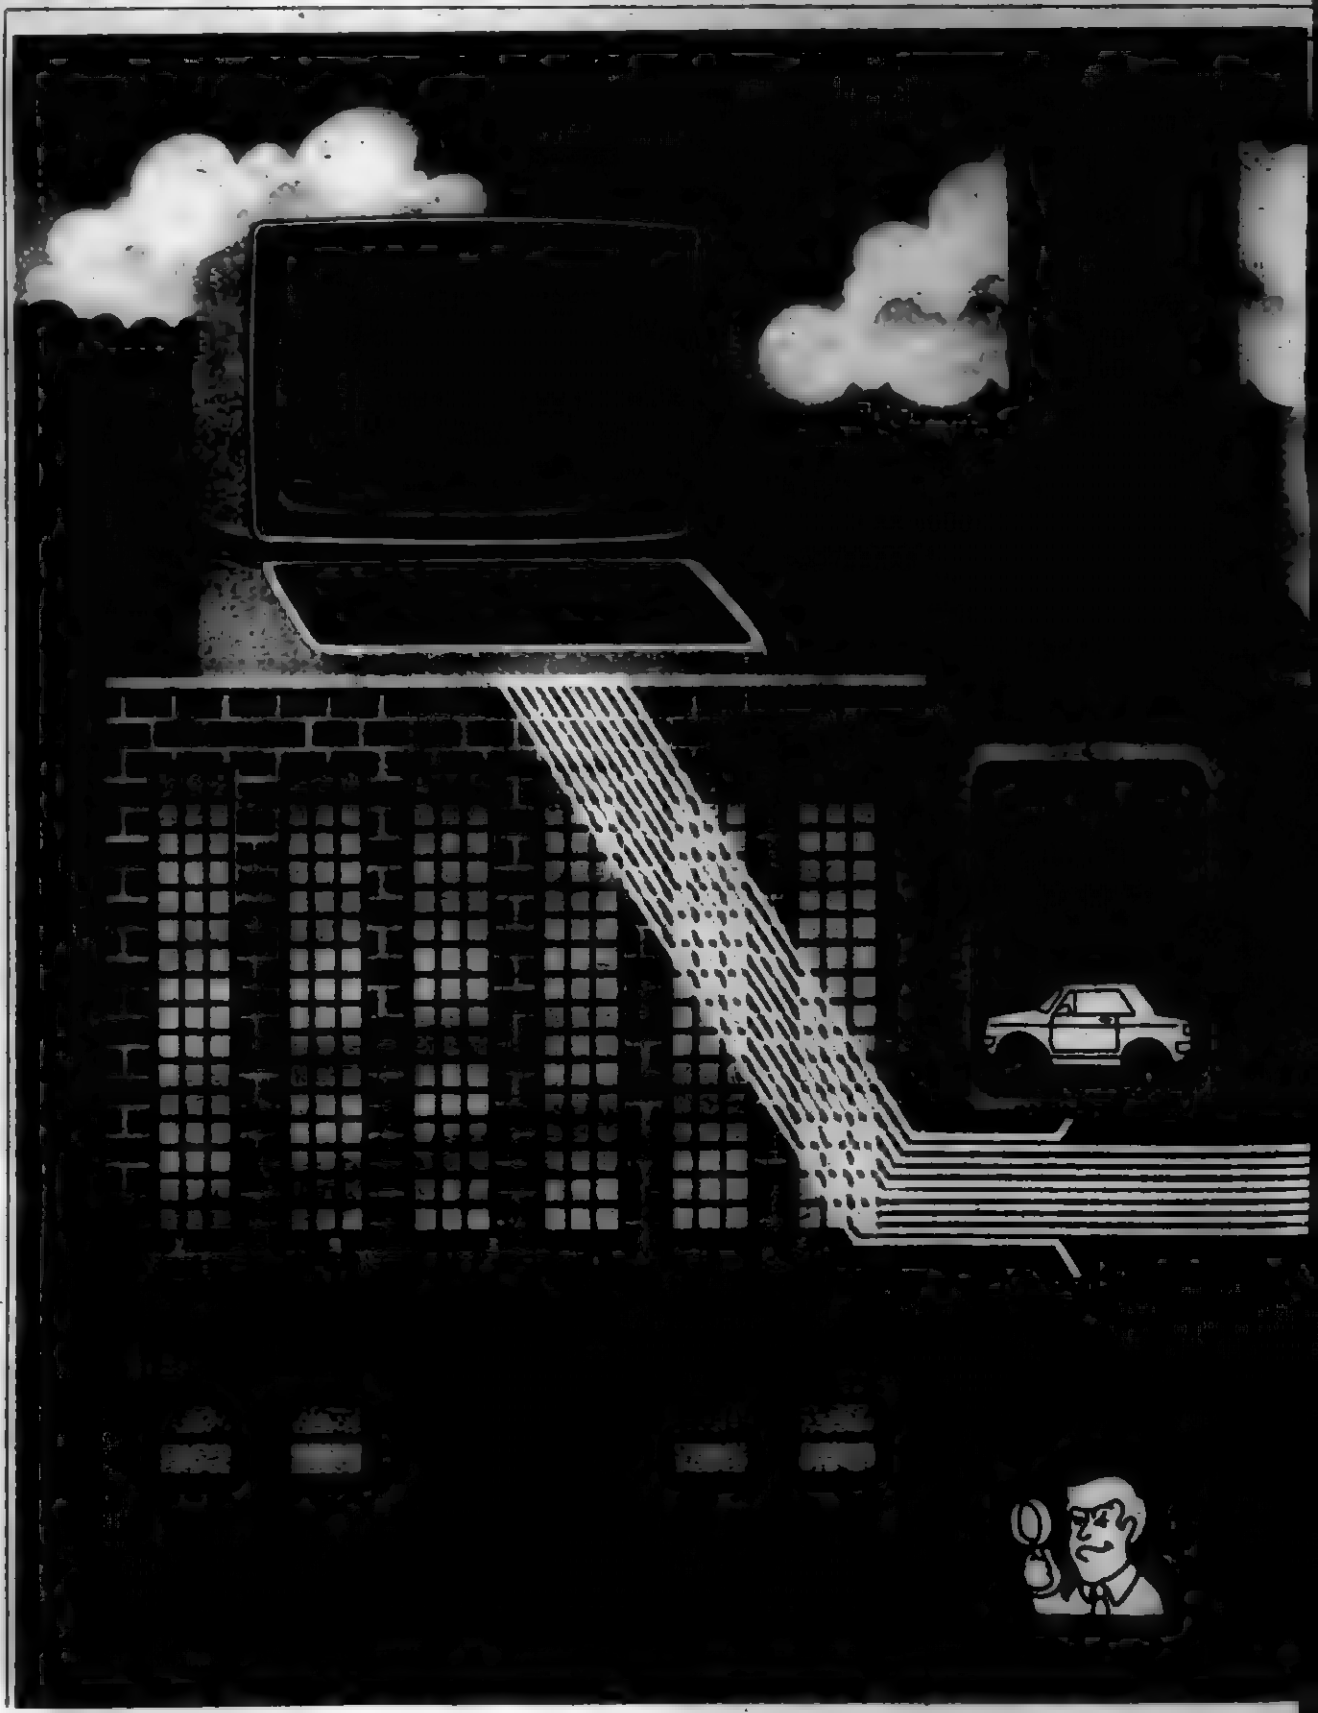
Direct.aid, Inc. has announced the Impersonator, a communications package that allows IBM Personal Computers to emulate any asynchronous terminal.

The program reportedly emulates Lear-Siegler, Inc. ADM-3A, Digital Equipment Corp. VT-52 and VT100, Hazeltine Corp. Esprit, IBM 3101, Data General Corp. D210 and Televideo Systems, Inc. 912 terminals.

The Impersonator costs $195.

Direct.aid, P.O. Box 4480, Boulder, Colo. 80306.

See SOFTWARE page 98



SOFTWARE from page 84

GMS COMPUTER SYSTEMS Infograph 100

GMS Computer Systems has announced Infograph 100, a graphics package for Digital Equipment Corp.'s Rainbow microcomputer.

The menu-driven program features decision rules that help the first-time user develop graphs and charts, the vendor said. Infograph 100 produces line, horizontal and bar charts. The program reportedly reads Software Arts, Inc. DIF files and uses the Rainbow's bit-mapped display.

The program costs $395.

GMS Software, 113 E. Severens Way, Carson, Calif. 90745.

IBM from page 83

lis, Md. "But its microcomputer is an average product. Some data processing managers may look for a better technical product or a lower price, so they turn to a compatible vendor."

Limited availability of IBM Personal Computers, not price or technical features, allowed Compaq to flourish, some analysts maintained.

"MIS managers wanted to buy an IBM Personal Computer," said Kate Cogswell-Carr, consultant at The Yankee Group in Boston. "IBM had trouble meeting demand for its microcomputers. Given the option of waiting for an IBM microcomputer or immediately receiving a Compaq, many data processing managers chose to buy the compatible."

A data processing manager disagreed with Cogswell-Carr's assessment. "We bought Compaq because it was a portable microcomputer that ran software for the IBM microcomputer," said Gary Schmidt, senior consultant at Pfizer, Inc. in New York. "IBM did not have a portable microcomputer."

IBM portable entry

Will IBM's recent entry into the portable market affect Compaq? "In the next six months, IBM will not ship enough portables to impact Compaq's sales," Kinne said. "Each retailer is limited to five IBM portables per month. With 1,400 retailers, IBM will only ship approximately 7,000 microcomputers a month," he added.

Compaq will face increased competition from other compatible manufacturers as well as from IBM. "Last year, there were 15 manufacturers claiming some level of IBM compatibility," Kinne said. "This year, there are 44 companies making that claim."

As competition increases, compatible manufacturers are attempting to increase corporate market penetration.

"Selling to corporate accounts will be an important [part], but not the major part of our growth," White said.

Compaq is increasing its support to its dealers. "We have a [toll-free] number dedicated to retailers selling to corporate accounts," Price said.

What will the future hold for compatible manufacturers? "Frankly, once IBM's production is in full gear, I don't think that many compatible manufacturers will remain in business," the retailer said.

PROTECT from page 88

package to be copied, plus it puts the developer in the awkward position of prosecuting his own customers. Also, it's hard to find the copies to begin with, and serialization is a relatively expensive procedure.

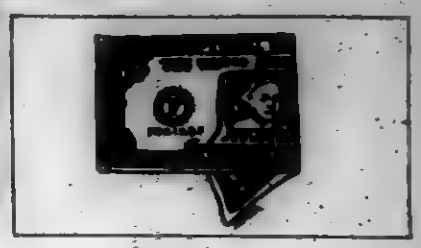
Signature techniques are software or hardware devices that are checked by the system in order to allow access. The most often tried techniques are simple code signatures that must be entered from the keyboard to allow the package to run. These, however, can be easily distributed by the buyer to someone who has been allowed to copy them, and who in turn doesn't have to worry about protecting them from unscrupulous customers.

The best potential protection devices are hardware signatures. These "black boxes," which plug into the computer, are individual to each buyer, but are controlled by the software supplier. Thus, there is no danger of the software being copied since it will not operate without the sealed "key," and this key cannot be easily reproduced. At the same time, unlike copy-proof systems, the software can be copied by the authorized buyer.

Hardware signatures, too, have limitations. They have to be manufactured, which adds to the cost of the software. There are also costs involved in keeping records. As a result, such devices are unlikely to be used for the protection of very low-cost programs. While simple, these devices still must be connected to the computer, which contributes some small additional complexity to the system. Though highly reliable, any hardware device can fail.

These problems, however, look very small when compared with the far more insurmountable drawbacks of other methods. Hardware signature devices offer the software developer sure protection for a small cost, and currently, that's way ahead of whatever is in second place.

Hurst is senior member of the technical staff at Point 4 Data Corp. in Irvine, Calif.



HP from page 83

desk space as a typical notebook, the Think Jet printer reportedly operates at less than 50 db and comes with a disposable cartridge that holds 500 pages worth of black ink.

Think Jet also incorporates assorted interfaces that enable the unit to attach both to HP micros and to competing systems from vendors like IBM, the IBM compatibles and Apple Computer, Inc., according to Product Manager Ernst Ernst.

The combination of quiet operation, compactness, disposable ink cartridges and other features gives the printer a "good shot" at becoming a de facto micro industry standard, according to Ely.

Key to Think Jet's performance is the product's removable cartridge, which integrates its print head and ink reservoir in a single $7.95 container that occupies about as much volume as a spool of thread.

With first customer shipments scheduled to begin April 1, Think Jet will sell for $495 through both authorized dealers and HP sales representatives.

More information about the printer can be obtained from HP at 1820 Embarcadero Road, Palo Alto, Calif. 94303.

REVIEW from page 83

cally different from that of a novice user. "Don't take any so-called expert's evaluation at face value," he said. "Be familiar with who is writing reviews, because that person's experience may be different from the experience of other users. And be sure the selection criteria are uniform."

How do you start? In many ways, software reviews are a lot like movie reviews. If you read enough computer magazines, you should eventually settle on a few whose judgment you trust.

A good way to identify impartiality is to scan several issues looking for negative reviews. "If the magazine never says anything negative about products, it's usually suspicious," Alsop said.

Regular contributors

Look for the same reviewer names issue after issue. It's relatively easy to find hobbyists who are willing to write reviews for a few dollars and a free copy of the software, but you probably can't take their opinions seriously.

Most publications that are serious about reviews maintain a list of reliable experts who contribute regularly. "We don't just accept reviews over the transom," Veit said.

You should also keep an eye out for reviewers whose experience matches your own. "We ask them to look at software from the end user's view, but it's often hard to get them to do that," Veit said.

Alsop noted that *Infoworld*'s most reliable reviews come from liberal arts college professors, "who are trained to think in an organized fashion."

And finally, be aware that all magazines approach reviews differently. *List*, for example, conducts a thorough analysis that details a product's claimed capabilities, the opinions of staff reviewers, interviews with users and a response from the vendor. That level of detail limits *List* to about seven reviews per month.

Editorial standards

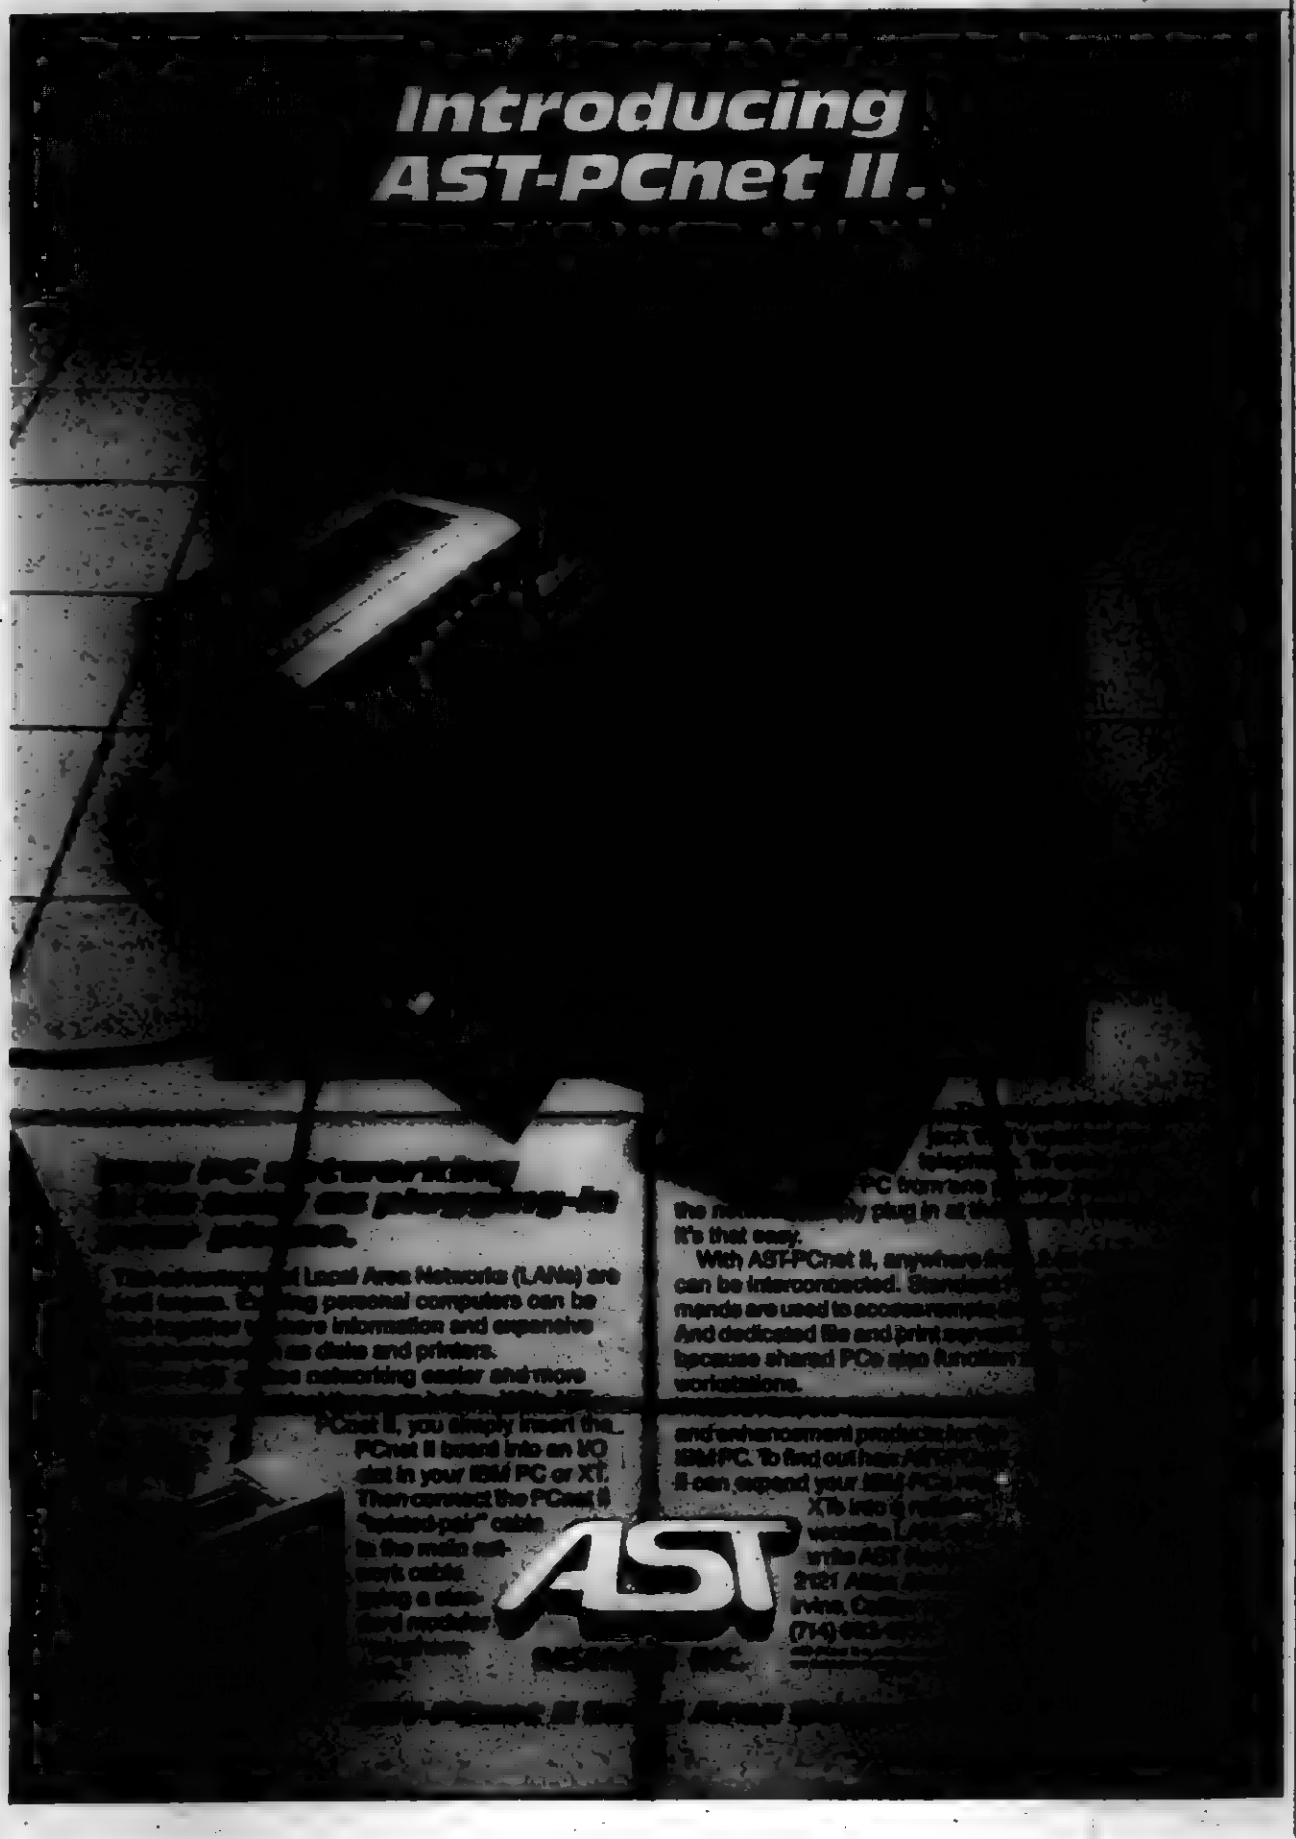
Infoworld relies on the objectivity of its reviewers and a set of editorial standards that a product must meet in order to receive certain grades on its "report card." For example, Alsop said, a product can't be judged excellent in the documentation category unless it includes on-line documentation.

Whatever magazines you read, keep software reviews in perspective, the editors advised. "There are 289 word processing software packages on the market for the IBM Personal Computer alone," Leonsis said.

"Reviews can save you time in terms of letting you whittle all the choices down to two or three. But your final step should be a personal demonstration," he added.

Alsop agreed that reviews should help a buyer weed out the four-leaf clovers from the crabgrass.

"But it's only one of three important components," he said. "The other two are personal experience and references from friends and other users."



COMPUTER INDUSTRY

INDUSTRY INSIGHT
Peter Bartok
CW Senior Editor

IBM lukewarm on local-area nets

For a company believed to be bringing out imminently *the* local-area network, IBM seems remarkably cool to the utility of such technology.

Talking to stock analysts recently at the company's Entry Systems Division in Florida, IBM President John F. Akers sounded very ho hum about the issue. He seemed to be saying that while IBM will be bringing out a local-area network it can be proud of, the company doesn't expect it to be any type of revenue leader.

Akers said it is "arguable" how much revenue will be generated by local-area networks. He did say, however, that there is a definite need in business for some method of workstation communications and file transfer on a cost-effective basis.

Make no mistake, IBM is bringing out a local-area network at some point. Akers said the company takes the need seriously and is "spending our fair share of research and development on it."

At one point, he said IBM is spending "a lot" and that company engineers have assured him the product will be based on fine technology and be "as cost-effective as anything on the market."

But for a company that daily proclaims its goal of being the low-cost provider, that hardly sounded like a blanket endorsement and certainly would seem not to herald anything incredible. Akers said he expects local-area network products to come in "many flavors," which causes one to surmise that IBM does not have a product that is going to shake up the industry.

The only point at which Akers came anywhere near to being excited about local-area network technology was when a stock analyst asked why the much-

Akers notes Fujitsu's 'window'

Says Big Blue's efforts won't 'let up for a minute'

By Peter Bartok
CW Staff

BOCA RATON, Fla. — Fujitsu Ltd.'s increased ownership of Amdahl Corp. has given the Japanese an important window to the U.S. market, IBM's president told a large group of stock analysts recently.

Speaking at IBM's Entry Systems Division headquarters here recently during a day-long briefing for the New York Society of Stock Analysts, John F. Akers — elevated a year and a month ago from senior vice-president to president — delivered a harsh assessment of the Amdahl-Fujitsu relationship and also declared IBM's intent not to let up in its drive for preeminence in the information processing industry.

Asked if the recent move by Fujitsu to boost its share in Amdahl to 49.5% was a defensive measure or represents a threat to IBM, Akers replied, "I think Amdahl has been a conduit for Fujitsu from the very beginning. I think this has given the Japanese manufacturer a very important window into the U.S."

Fujitsu's recent stock acquisition, according to Akers, "indicated [Fujitsu] thinks its participation will grow. I expect its product line will expand."

IBM will more than triple production of its Personal Computer line of products this year and still not keep up with demand, according to the head of IBM's Entry Systems Division. Page 103.

In their efforts to expand in international markets, the Japanese "have accommodated too many different relationships around the world," Akers said. Japanese manufacturers are strong competitors, he added, and at IBM "we take them seriously."

Reviewing IBM's success over the past two years — in terms of new product acceptance and healthy revenues and profits — Akers declared IBM will not become complacent because of that success. "We do not intend to let up for one minute," he

IBM to saturate workstation mart

By Robert Blatt
CW West Coast Bureau

DALLAS — IBM intends to saturate a $6 billion workstation marketplace from high end to low end through aggressive product pricing, with the goal of controlling access to users' host computers, the Association of Data Processing Service Organizations (Adapso) was told here last week.

Speaking at Adapso's 80th Management Conference, Scott Smith, a financial analyst at The Gartner Group, a Stamford, Conn.-based research firm, said IBM will compete against hardware vendors rather

U.S. crimps DEC's export privileges

MAYNARD, Mass. — Digital Equipment Corp.'s export privileges have been limited by the U.S. government, reportedly because one of the company's superminicomputers was seized on a ship bound for the Soviet Union last year.

Company officials reported last week that the U.S. Department of Commerce, in a surprise move, placed major restrictions on DEC's shipments of computers to West Germany, Norway and Austria, three countries the government considers prime diversion points to the Soviet Union.

A Way to Keep Computers on the Right Track

Japan execs deny DP success, urge U.S. cooperation

By Robert Batt
CW West Coast Bureau

SAN FRANCISCO — The image of Japan as an all-powerful economic and technological juggernaut was dented by some of its own industrialists here at a two-day conference jointly sponsored by the Japan External Trade Organization and The Conference Board, Inc.

Titled "Japan and U.S.: Cooperating in High Tech," the conference brought together representatives from government, industry and academia of both countries.

Koji Kobayashi, chairman of Japanese computer maker Nippon Electric Co. Ltd., said Japan's success in the data processing and electronics fields is superficial when compared with the deep roots of science and technology in the U.S. However, he said, "although the foundations of Japanese science and technology are still weak, Japan has to have self-awareness and responsibility as an economic power and meet the challenge of high-technology development. She has to step forward vigorously on the road to healthy competition and cooperation as a trusted partner of the United States."

Kobayashi

In order to facilitate this at the stage of basic research, information should be widely disclosed, Kobayashi said. As the new technology approaches the stage of practical use, all parties should compete actively with each other and make efforts to improve production techniques and explore markets.

Another effective means of technology transfer, he asserted, is to set up plants in one another's country and to manufacture products locally. However, he warned, for this to continue, the taxation system in both countries must be fair, and he lashed out at the unitary tax enforced by some U.S. states, requiring overseas investors to pay state tax on their profits earned worldwide.

"We are strongly opposed to the unitary tax, and we sincerely hope that it will soon be abolished," he declared.

The conventional wisdom that Japan is a high-technology giant backed with millions of dollars from its own government was attacked by another Japanese speaker — Seiichi Ishizaka, adviser to the Nomura Research Institute.

Ishizaka said the Japanese government's share of expenditure on research and development is extremely small; of $27.3 billion spent on industrial R&D in 1981, only 27% of that amount involved public money, he said.

Sherwood Fawcett, chairman of the Battelle Memorial Institute, specialists in joint high-technology research projects, said Japan is more willing than the U.S. to fund research over the long haul.

"On acceptance of proposals and the funding of research programs, the Japanese have been more prone than Americans to fund research and development over the last 10 years. Their requirements are better organized for the long haul and in major targeted areas. They are willing to fund high-risk, longer term things than we are," Fawcett said.

However, Fawcett continued, there are weaknesses in the Japanese approach.

"When you look at some of the literature coming out of the Japanese universities, some of the fundamental work is very impressive, but the more practical applied work is not as impressive. We have also noticed as we work with the Japanese that everyone is careful not to stand out to be different. This attitude tends to stifle creativity and innovation," he charged.

BECOME A CICS CONSULTANT IN JUST TWO WEEKENDS.

We know that it's tough for consultants to fit a weekday course into their hectic schedules. That's why SysEd offers special CICS training courses for consultants that you can complete in only two weekends.

Our intensive weekend courses in Command Level, Macro Level, Internals, Application Design and VSAM are designed to make even non-CICS programmers immediately productive in a CICS environment. Each SysEd course provides a true-to-life learning experience with "hands-on" use of the computer; up-to-date, practical information; a solid foundation in CICS fundamentals and insights into advanced materials; and individual attention from highly qualified instructors.

SysEd's special weekend courses for consultants are held regularly at our classroom/computer facilities in New York City, Chicago, San Francisco and Dallas. Because class size is limited, applications are on a first come, first served basis.

Modcomp's '83 losses equal $23.8 million

FORT LAUDERDALE, Fla. — Modular Computer Systems, Inc. (Modcomp) recently announced a net loss of $23.8 million, or $4.43 per share, for the year ended Dec. 31, 1983, as revenue declined $17.8 million from the previous year.

Sales in 1983 amounted to only $74.9 million, compared to $92.7 million in 1982, when a profit of $1.7 million, or 34 cents per share, was reported.

For the fourth quarter of 1983, the company experienced a loss of $10.9 million, or $2.08 per share, with sales of $18.1 million, an 18% decline from the corresponding period a year earlier.

Gabriel A. Rosica, president and chief executive officer of Modcomp, said that 54% of the loss was attributed to the production, marketing and subsequent discontinuance of the Zorba portable microcomputer, acquired in June of last year and discontinued in February 1984. Another factor contributing to the loss was a decline in minicomputer sales volumes, Rosica said.

The company attributed the minicomputer sales decline to the effects of the recession on Modcomp's industrial customers and the lack of significant new products.

The company reduced its work force by 14% in September and consolidated office and factory space to reduce leasing expenses, Rosica said.

The company announced two products late last year; Rosica said the Classic II/15 single-board minicomputer began shipping on Jan. 31, and the Classic 32/65 is planned for shipments in the fourth quarter.

Austin directory available

AUSTIN, Texas — A directory of businesses involved in the Austin area's growing computer industry has been announced here. The directory lists local computer stores and dealers, software publishers, programmers, repair centers and educational centers.

The first edition of the directory was produced in November 1983. It reportedly will be updated quarterly. Listings are alphabetically indexed and cross-indexed by Zip Code.

The directory is available for $4.95 per copy from The Computer Task Force, P. O. Box 275, Cedar Park, Texas 78613.

Tech innovation seen key in race for global market shares

As well as an impetus for cooperation between U.S., Japan

By Robert Batt
CW West Coast Bureau

SAN FRANCISCO — Companies that have done the best job of combining ideas, resources and people are likely to be the winners in the international high-technology arena, according to speakers at a conference here recently for U.S. and Japanese executives.

Takeo Kondo, president of Mitsubishi International Corp., was one of the speakers at the conference on "Japan and U.S.: Cooperating in High Tech" sponsored by the Japan External Trade Organization and The Conference Board, Inc. He said the development of technology requires an international perspective.

"Matching innovation to the need for innovation, assessing the impact of new technological breakthroughs and finding commercial applications in new and established industries are, in fact, international issues, and they impact crucially on the competition for global market shares," Kondo said.

The dazzling advances in technology in the U.S. and Japan have increased both the opportunities for cooperation between the two countries and the forms that such cooperation may take, according to Kondo.

As examples of this cooperation, he cited the formation of a joint venture in Japan among Mitsubishi, IBM Japan and a Japanese software-oriented venture firm to develop and market hardware and software. Also, he added, Mitsubishi recently acquired equity in Microrim, a Bellevue, Wash.-based software house, and forged a linkup between the U.S. firm and a Japanese software developer, with a view ultimately towards marketing its products in Japan.

Kondo

"Still another vehicle for cooperation in high tech is the practice of importing equipment under OEM," according to Kondo. "For example, an advanced office automation system developed by an American manufacturer might be enhanced by a piece of equipment that could be better produced in Japan or elsewhere. As the newly industrialized countries become more technologically advanced, we should see more such arrangements on a multilateral scale."

Erich Bloch, vice-president of corporate technical personnel development at IBM, stressed the value of cooperative research between the two countries.

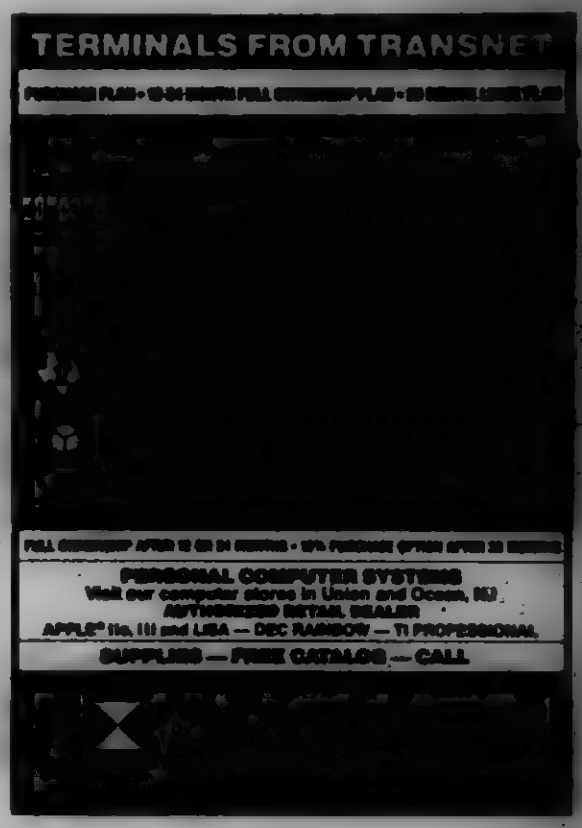
Cooperation, he contended, will not stifle competition, but rather will promote it by bolstering the fabric of high-technology industries. "Those who can translate research into products quickly and effectively will reap the benefits of cooperative research," he said.

Bloch, who is also chairman of Semiconductor Research Corp., warned his audience that the U.S. is being outspent by Japan in semiconductors. "Our research and development in the U.S. is much more dispersed than it is among our trading partners. In Japan and Europe, R&D is much more focused in areas such as computers and semiconductors."

Bloch said there needs to be an even-handed approach toward cooperative research, and he warned that the controversy now raging over Japan's proposals to change its software copyright laws [CW, March 19] is an example of something that could "throw cooperative research under a cloud."

The economic controversies between the two countries were also noted by another speaker — Tadashi Sasaki, senior executive vice-president at Sharp Corp. Japanese and U.S. talents complement one another, he maintained, and it should be easy for the two countries to work together to improve their collective performance.

"However, there are numerous political and economic obstacles which will be overcome only by great effort. In particular, our governments must adhere to the precepts of free trade, and we must continue to hold high-level meetings across a broad spectrum of issues if we are to bridge our differences," he concluded.



Victor weighing proposal

By Patricia Keefe
CW Staff

SCOTTS VALLEY, Calif. — Having decided to sell "substantially all" of the assets of its computer business, Victor Technologies, Inc. is considering a proposal for its European distributor to acquire worldwide manufacturing rights to Victor computer products.

The financially troubled Victor recently became the third micro maker in a six-month period to file for protection from its creditors under Chapter 11 of the federal bankruptcy code. Victor's debt is estimated at over $100 million.

In a letter to the U.S. headquarters of the distributor, Applied Computer Techniques PLC (ACT) of Birmingham, England, Victor's board of directors reportedly indicated that it would consider submitting ACT's proposal for approval by all of the interested parties. Victor also said that proposal had the full support of its creditors committee, which is chaired by attorney Arnold Quittner, according to a spokesman for ACT (North America), Inc., ACT's U.S. subsidiary. The announcement is said to be the result of five weeks of negotiations.

Over the next few weeks, a detailed agreement is expected to be submitted for final approval to all the parties concerned prior to filing it with the federal Bankruptcy Court, ACT said. Victor's board also authorized its acting chief executive, its consultant and its bankruptcy counsel to clarify outstanding points and conclude negotiations, the spokesman said.

ACT's proposal would enable it to secure worldwide distribution rights, excluding the Americas. The assets to be acquired under the proposed agreement would consist primarily of stock and receivables.

In other business concerning Victor, Lotus Development Corp. last week announced it has discontinued its version of 1-2-3 for the Victor 9000. However, it will continue to fully service and support all Victor 9000 users who have purchased 1-2-3, a spokesman said.

IBM boosts micro production, still lags behind demand

By Peter Bartelt
CW Staff

BOCA RATON, Fla. — IBM will exceed its personal computer production goals this year and still not catch up to demand, according to Philip D. Estridge, president of IBM's Entry Systems Division.

The company will more than triple production of the personal computer line of products — ramping up U.S. production from a rate of one unit coming off the assembly lines every 16 seconds to one unit every seven seconds, Estridge told almost 300 stock analysts gathered here recently.

Industry analysts had already expected IBM to ship two million units this year, and Estridge's comments seem to indicate an even greater volume. He also said IBM early in March began offering an IBM credit card for use at its retail product centers.

The all-day session at the Entry Systems Division headquarters and nearby production facilities was arranged for the New York Society of Stock Analysts and featured a tour of the Personal Computer and Personal Computer XT production lines that will be increasingly automated by this summer. Estridge said IBM will spend $500 million this year on expansion of the Entry Systems Division, equally divided among facilities for existing products, facilities for new products and new equipment.

Estridge said more Personal Computers were shipped for use within IBM divisions this year than were distributed for sale when it was first introduced in 1982. According to Allen Krowe, chief financial officer and senior vice-president of IBM, some 22,000 Personal Computers are presently in use in IBM divisions, and that figure should increase to 60,000 by the end of 1984. Krowe said IBM is confident Personal Computers will increase demand for large processors, because a majority of internally used micros are tied into large processors.

Estridge said he doesn't think the demand curve has even begun to appear at this point and noted that as each new Personal Computer product is introduced by IBM, demand soars. With the Personal Computer products, he said, "We're really doing old jobs today with these machines; the new jobs are just starting to emerge."

But while the Personal Computer and Personal Computer XT products can't keep up with demand, production of the recently introduced PCjr is already close to catching up with demand, Estridge said, adding to speculation that the PCjr is not doing well in the marketplace.

IBM, however, believes the low-end Personal Computer product — actually made under contract by Teledyne Corp. in Tennessee — is "uniquely" suited for home, school and work-at-home applications, Estridge said. Pointing to the wide array of third-party, add-on products available for the other Personal Computer products, Estridge said it is possible consumers at some point could enhance the PCjr to the level of the basic Personal Computer, but at a lower cost.

Commenting on IBM's strategy of establishing third-party distribution channels and relying on third-party components, Estridge said the job is too much for IBM. "Not only do we not have enough resources, we don't know how," he said.

IBM granted motion against Cybernex

SAN JOSE, Calif. — IBM recently was granted a motion in federal court for an injunction prohibiting Cybernex Ltd. from using alleged IBM trade secrets in the manufacture of thin-film recording heads.

Cybernex, which is headquartered here, immediately issued a statement maintaining the "relative handful" of items that are covered by the injunction will not materially affect the company's ability to manufacture thin-film heads.

According to William Klein, Cybernex's president, the "limited nature" of the injuction, relative to what IBM originally sought, justified the company's belief that the few similarities between its manufacturing process and that used by IBM "are coincidental — the results of the nature of the product itself and good engineering practice."

Cybernex said it had "opened its doors" to IBM engineers when IBM first expressed concern and that IBM had based its court action on the joint efforts examining the Cybernex processes. Cybernex said it didn't think IBM had acted in good faith.

Rixon, Lotus settle $10 million lawsuit

CAMBRIDGE, Mass. — Without admitting any wrongdoing, Rixon, Inc. recently agreed to several demands from Lotus Development Corp., thus settling a $10 million lawsuit that Lotus filed against Rixon two months ago.

Filed in U.S. District Court in Boston Jan. 31, the suit charged Rixon with making unauthorized copies of the Lotus 1-2-3 software program and related documentation and then distributing the copies to Rixon branch offices throughout the country.

Under the terms of the settlement, Rixon consented to the entry of a permanent injunction prohibiting it from making or using copies of the 1-2-3 program and related materials in the future. In addition, the data communications vendor agreed to pay Lotus an undisclosed amount of money as part of the settlement.

Rixon also agreed to investigate the allegation of copying and to return all its unauthorized copies of 1-2-3 disks and documentation.

Lotus President Mitchell Kapor said Rixon management had cooperated fully in investigating the allegations of copying activity.

The settlement "represents a major step in our effort to eliminate the software piracy problem," according to Kapor.

How 3 famous names got together to

SOLVE YOUR PROBLEMS OF INTELLIGENT MICRO TO MAINFRAME CONNECTION.

Get the answers you're looking for—with the VisiAnswer Software System from Informatics, the leader in mainframe to micro integration.

Informatics has teamed the best minds in the business to solve the problems of intelligent mainframe data access for microcomputer users. The VisiAnswer™ Software System is the breakthrough result of a unique team involving Informatics Corporate Micro Systems and VisiCorp™ products working with IBM® Personal Computers.

VisiAnswer solves the timely problems plaguing data processing professionals like you.

Available for use right now, the VisiAnswer Software System is the micro to mainframe system specifically designed to help you:

- Manage *and* control the integration of microcomputers with your current mainframe—right in *your* data processing department.
- Provide your company's micro end-users with access to specific mainframe data—without wading through unrelated information for hours.
- Maintain *security*/control of restricted portions of your corporation's data.
- Supply end-users access to *current "live" information*, instead of information that's historical and obsolete.
- Intelligently access *all* mainframe data, whether it's unique application data or part of a data base management system.

VisiAnswer makes your job easier and more efficient than ever.

With more and more managers and analysts in your company using desk-top computers these days, there's a tendency to improvise the way they obtain the data they need. That leaves the door wide open for mistakes and inaccurate information.

Now you can avoid these problems and maintain a high level of data processing efficiency for everyone who needs access to that data with the VisiAnswer Software System. It delivers intelligent solutions that make current mainframe data available to your end-users in an orderly fashion. That makes their jobs *and yours* easier and more accurate—something upper management will appreciate.

VisiAnswer was designed by the best minds in the business to fit your business.

You get Informatics' expertise in data access technology and mainframe system software... plus VisiCorp's expertise in user-friendly micro software. We chose the IBM Personal Computer for its leadership in delivering business solutions, and IBM chose us as a value-added remarketer.

This system works with *all* data bases on IBM mainframe systems. And your end-users will get data that is immediately usable with all Visi Series™ Products and other products utilizing the VisiCalc® file format.

Find out more about Informatics VisiAnswer system. Mail this coupon or call toll free today. See how VisiAnswer products can fit into your Personal Information Center as an integral part of your unique business strategy.

Get the facts on VisiAnswer—
the intelligent micro to mainframe connection.

Attention to quality stressed for high-tech executives

By Robert Batt
CW West Coast Bureau

LOS ANGELES — High-technology companies are out of touch with both their own employees and their customers, a management consultant told some 400 high-tech chief executives and senior managers here recently.

Speaking at a conference on managerial excellence presented by the Southern California Technology Executives Network, Thomas Peters, president of the consulting firm Skunk Works, Inc. and coauthor of the book *In Search of Excellence*, said attention to mundane details is the secret to rapid productivity gains.

"The number one managerial shortfall in this country is managers who are out of touch with their own employees and customers. Technology companies are failing flat down when it comes to supplying total customer satisfaction. . . . Quality needs to become the strategic focus of high-tech organizations," he claimed.

The key to the long-term viability of high-technology concerns, Peters added, is not the people in the research and development center, but the person on the production line.

Sense of trust

Peters said it is essential to instill a sense of trust within a company. "If you insist on treating the people in your organization like children, do not be surprised when they respond that way," he told the executives.

Peters said there is a critical need to build the institutional skills that will lay the foundation for future rapid growth. For this to happen, he warned, a complete shift in the notion of leadership needs to take place.

"The only value of a chief executive is to pay attention to what is important. The leader in an organization should be a coach, a nurturer and an enthusiast," he stressed.

Also speaking at the conference, Floyd Kvamme, then-executive vice-president at Apple Computer, Inc., emphasized the critical relationship between vendors and management information systems (MIS) departments.

Referring to the dominance of IBM, he said, "It is important to position your competitors accurately. When it comes to large organizations, the prime vendor is not IBM; rather, it is the MIS department. You need, therefore, to be customer-compatible, not IBM-compatible, because you are in business to support your customer, and your customer is not IBM, it is the MIS department."

Kvamme said the chief executive should consider himself or herself the number one quality officer in the company. "The job of a chief executive is to create and establish the right set of issues for your company. Quality starts in your office, and you must get everyone in your organization to sign up," he added.

Allen Michels, chief executive officer at Convergent Technologies, Inc., stressed the need for risk-taking in establishing a high-technology venture. He said that a corporate leader needs to be willing to risk everything and be accountable for the collective failure of others, should that occur.

"Set impossible goals," he advised his audience. "If you can manage people effectively in the pursuit of impossible goals, it gives great strength and power to your organization."

Michels said that only by simplifying the communication process in an organization can such goals be achieved, so it is vital to keep a company simple and lean.

"Keep people focused on the goals. Focus on making decisions in key areas such as manufacturing, marketing, research and development and the collective set of managerial objectives and stick to the basics," he added.

ITT reports revenues down

NEW YORK — ITT Corp. announced recently that revenues were down 4.5% in 1983, compared with 1982, and that earnings were up 1.8% over the year-earlier figures after a restatement of earnings for the first three quarters of 1983 and for earlier periods.

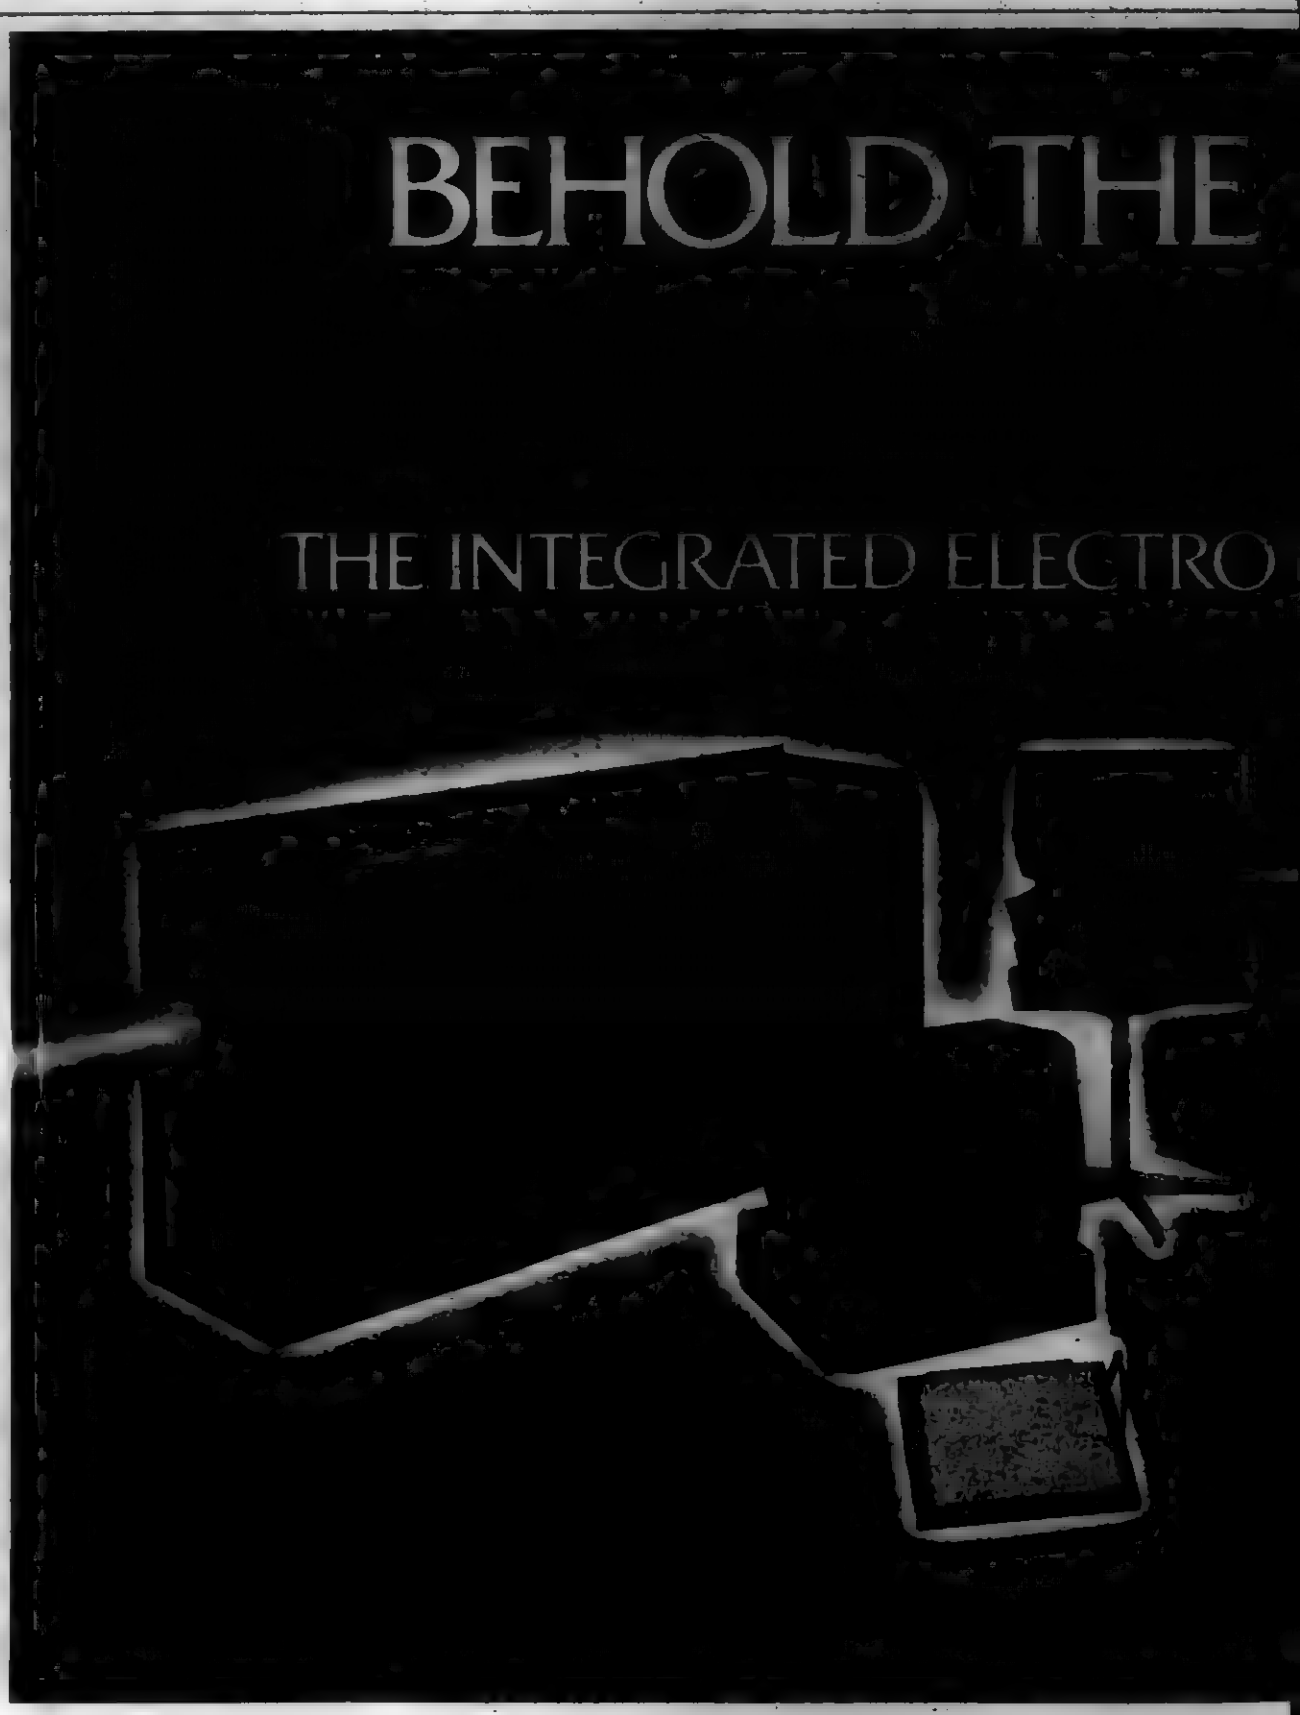
Earnings for the year were $675 million, or $4.50 per share, compared to the restated 1982 earnings of $663 million, or $4.47 per share, according to ITT.

Prior to the restatement, 1982 earnings had been reported at $703 million, or $4.75 per share.

Revenues for 1983 were $20.2 billion, down from $21.2 billion in 1982.

For the fourth quarter of 1983, ITT reported earnings of $278 million, or $1.86 per share, up 13.5% from the restated earnings for the comparable period in 1982, when earnings were $245 million, or $1.65 per share.

Prior to restatement, fourth-quarter 1982 earnings were $272 million, or $1.84 per share.



COMPUTER INDUSTRY

Akers lauds AT&T expertise at AEA conference

By Peter Bartolik
CW Staff

BOSTON — IBM may be big, but "the industry dwarfs us," company president John F. Akers said here recently in a brief but wide-ranging press conference at which he also acknowledged the technical expertise of potential rival AT&T.

Akers, named president in February 1983, held the press conference after delivering the keynote address to a seminar for industry executives sponsored by the American Electronics Association (AEA) Productivity and Quality Center.

Asked to comment on the impact of the AT&T divestiture on IBM, Akers said the divested operating companies "are becoming a source of distribution to us, just as they are becoming a source of distribution to other companies." But Akers said he doesn't believe that distribution channel will be major.

With speculation rampant in the industry these days about AT&T's expected move toward becoming a major information processing systems vendor, Akers delivered some unexpected kudos in the direction of the communications giant.

"AT&T has had a history of technology and products that is hard to argue with, and I expect that to continue," he said. "Unix is probably the most successful product for AT&T so far," Akers said, adding that he expects AT&T to deliver more products to the market.

When he was asked what IBM considers to be its major competition, Akers protested that "the industry is a very big industry . . . probably five times, six times IBM's size — the industry dwarfs us."

During his keynote address at the AEA seminar on "Productivity and Quality According to IBM and Hewlett-Packard," Akers said that four years ago the company found there was room for improvement in the quality of its products and took steps to focus quality improvement on the process of development and production.

He said the industry has a leadership challenge every day, but also has leadership responsibilities. "Society more and more demands quality in our products. . . . if we don't respond and respond well, society, it seems to me, will help us respond."

When it began its quality improvement project, IBM discovered it was "too often fixing quality products in our customers' offices at great expense to us and to them."

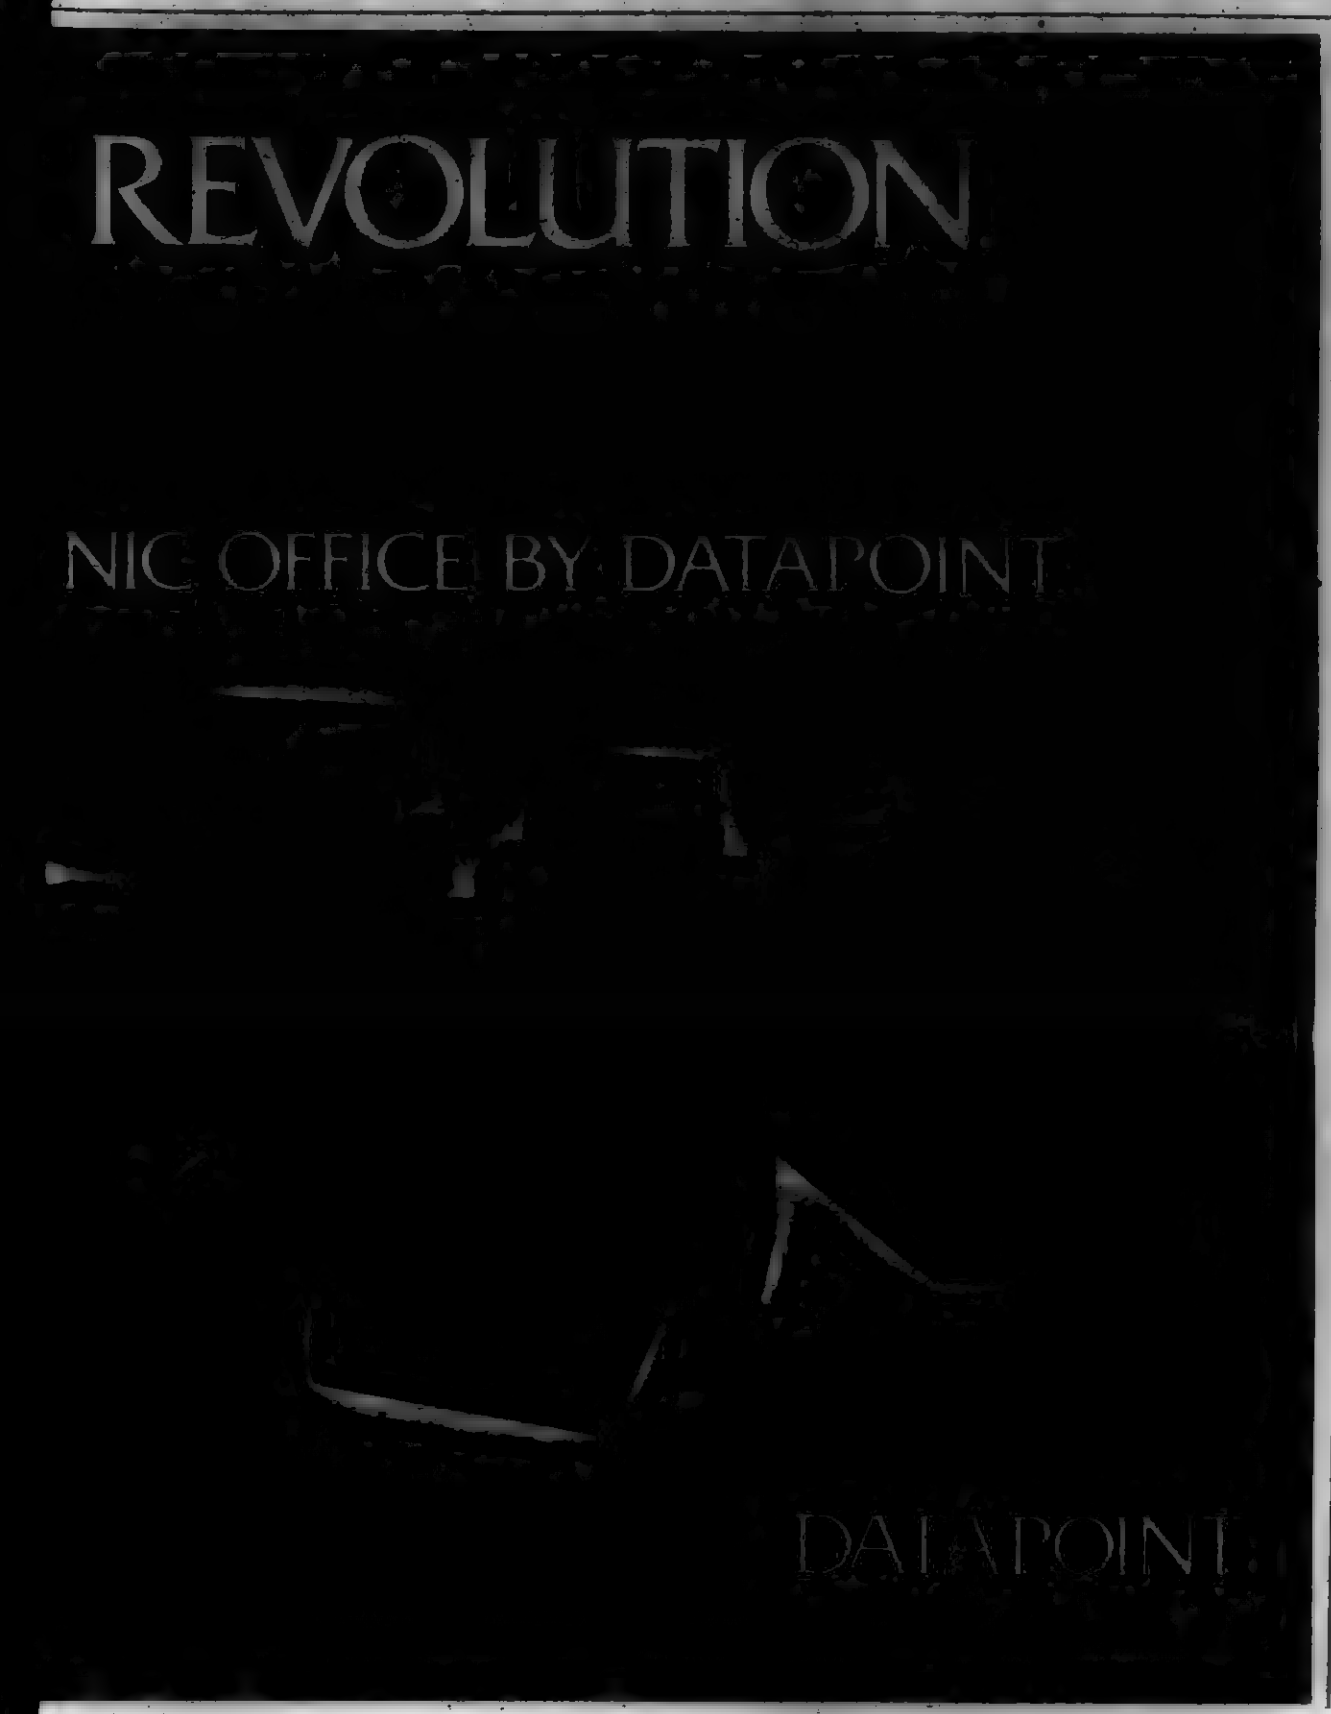
The company also realized, according to Akers, that it had become "too tolerant of defect levels," ramping up production levels to offset an expected number of defects and requiring its suppliers to deliver supplies at 95% defect-free levels, instead of seeking totally defect-free supplies.

Five tenets

Akers said IBM evolved its quality improvement plan around five tenets: management action and involvement, employee participation, focus on the job process, "no level of defect is acceptable," and quality improvement reduces total costs.

While nonacceptance of defects "certainly required within IBM a change in attitude," Akers pointed out that the company's "profit growth exceeded revenue growth at an increasing rate, and we know quality growth had something to do with that."

IBM implemented a product policy requiring the quality and reliability of new products at the time of general availability to be superior or at least as good as anything else on the market, Akers said. Releasing one processor, he said, required "four tries" before the repair action rate was lower than the older product it was replacing.



Cullinet to buy Insci system

WESTWOOD, Mass. — Cullinet Software, Inc. said last week it has an agreement in principle with Information Science, Inc. (Insci) to acquire rights to Insci's IDMS-based Payroll/Personnel System.

The agreement, according to a Cullinet spokesman, provides for Cullinet to pay approximately $5 million plus royalties to Insci over a seven-year period for the system, related technology and Insci's IDMS current and prospective customer base. Insci's existing IDMS Payroll/Personnel accounts will be transferred to Cullinet for a $2.5 million payment.

Robert N. Goldman, president of Cullinet, said, "The addition of payroll and personnel software to our existing line will not only add important applications, but will also ensure the integration of these systems with our manufacturing and financial applications software."

Jody Dyer, president of Insci, said, "By transferring this product to Cullinet . . . Insci will be better positioned to continue to deliver outstanding products for other operating environments."

COMPUTER INDUSTRY

Boom times predicted for artificial vision industry

COTTAGE LINES
Bohdan Szuprowicz

Artificial vision consists of electro-optical systems that act as sensors and interpreters that can automatically identify specific patterns and trigger appropriate action of associated mechanisms or systems. No self-respecting robot can call itself "intelligent" anymore if it does not have a vision system that guides it to perform specific tasks in response to known but randomly occurring external factors.

Studies show that human beings acquire 83% of their knowledge through sight, 11% through hearing and the rest through the other senses. Since the world is built around us and for us, robots that can act like us can probably serve us best. This suggests that we must give them the best vision we can afford.

Artificial vision is not just a TV camera strapped to a mechanical arm that records images on tape. The system must be able to digitize the image instantaneously, compare it with specific patterns stored in its memory and decide whether it "sees" what it is supposed to see before it acts. Vision is important in automation and will become even more so as the factories of the future develop into flexible manufacturing centers.

Vision systems that depend on specialized software and are based on general-purpose computers can be made very flexible, but may also be too slow and cumbersome for many practical applications. New developments in very large-scale integration, microchip customization services and the use of laser beams open up new vistas for tailor-made embedded vision systems that are very fast, highly specialized and also cost-effective.

All these developments, on the eve of an expected robotics explosion during the mid-1980s, suggest boom times ahead for the fledgling artificial vision industry. The market is but a few years old and was estimated at only $40 million in 1983, but is expected to double during 1984.

Actually, robotic guidance accounts for only 20% of artificial vision consumption today. Straightforward inspection and measurement applications on the production line each claim 40%. But observers are confident that robots will become the largest consumers of artificial eyeballs in the very near future.

Applied Intelligent Systems is one new firm in this business which manufactures an artificial vision system that can inspect 10 integrated circuit microchips every second with 100% accuracy. This is the type of application with the greatest future, particularly as integrated circuits and assemblies become more complex. Electronic assembly automation, where numerous components must be identified, inspected, placed and reinspected several times, is an area ripe for artificial vision applications in the form of intelligent robots or specialized vision systems.

Other new firms that target electronics assembly include Machine Vision International, Control Automation and Intelledex, which manufactures specialized robots with vision for handling silicon wafers and magnetic disk reading head assembly.

Integrated Automation is another start-up that is manufacturing robotic systems based on artificial vision concepts for factory automation. In late 1983, the company registered 2,250,000 shares of stock for sale to the public at a later date.

Several companies involved in artificial intelligence are also participating in the mechanical vision boom, because artificial intelligence methods are used in the pattern recognition software of artificial vision systems. Most prominent of these are Cognex, which makes devices for automatic reading and verification of labels; Machine Intelligence, a Stanford Research Institute spin-off that produces vision interpretation systems; and Octek, which is designing vision systems for computerized applications.

There are also a host of smaller firms — such as Diffracto, Electro-Optics Controls, Perception, Synthetic Vision Systems, View Engineering, and Vision Peripherals — that are providing a variety of products ranging from car door assembly inspection systems in automobile plants to just plain and simple consulting on artificial vision use.

Not to be forgotten are the companies that rely on vision for their products. These include such better known names as Automatix, Inc., Robotic Vision Systems and Object Recognition Systems, which specializes in automatic bin picking systems for robots.

Last but not least are the subsidiaries or divisions of large corporations such as Automatic Inspection Devices, owned by Owens-Illinois; General Electric Optoelectronic Systems; and Hitachi. Most other robot manufacturers are clearly developing into a new market for artificial vision suppliers, but if the field becomes too crowded, they may well continue to acquire and merge these operations into their own.

EXECUTIVE CHANGES

The Professional Services Management Association (PSMA), an organization of professional service firm executives, has appointed Donna Tobin as its first executive director.

In conjunction with this appointment, PSMA has established new offices at 1213 Prince St., Alexandria, Va. 22314.

■

Daniel McHale has been named president of Xiox Corp.

■

Thomas L. Chun has been elected vice-president, legal affairs, and secretary and **Lawrence W. McGraw** has been elected vice-president, marketing and service support, at Tandem Computers, Inc.

■

Duncan N. MacDonald has been appointed vice-president/general manager at Computer Storage Technology, Inc.

■

Ronald R. Riedesel has been named vice-president, strategic marketing, at Reference Technology, Inc.

■

William S. Martin has been named vice-president, planning and business development, for GTE Communication Systems.

■

Michael P. May, executive vice-president, treasurer and a director of Applied Communications, Inc., has been assigned additional responsibilities as chief operating officer.

■

Gary Morgenthaler has been promoted to president of Relational Technology, Inc.

■

Digital Equipment Corp. has promoted three senior managers to vice-president. They are **Rose Ann Giordano**, large systems marketing; **Robert C. Hughes**, business and systems marketing; and **John L. Sims**, business and office systems marketing.

■

Richard B. Gordinier has been named president and chief executive officer of Vault Corp.

■

Nikolaus Kampf has been promoted to vice-president of supervisory controls systems and **Gary Fuller** has been named vice-president of operations at Aydin Corp.'s Computer Systems Division.

■

David A. Campbell has been named chairman of the board of Computer Task Group, Inc. **John P. Courtney** has succeeded Campbell as president and chief operating officer.

■

Sanders Associates, Inc. has announced the following appointments: **Edward A. Miller**, executive vice-president; **James P. Woolnough**, president, Federal Systems Group, and senior vice-president; **Richard A. Read**, executive vice-president, Federal Systems Group; and **Jerry G. Sessler**, senior vice-president, Electronic Warfare Division.

■

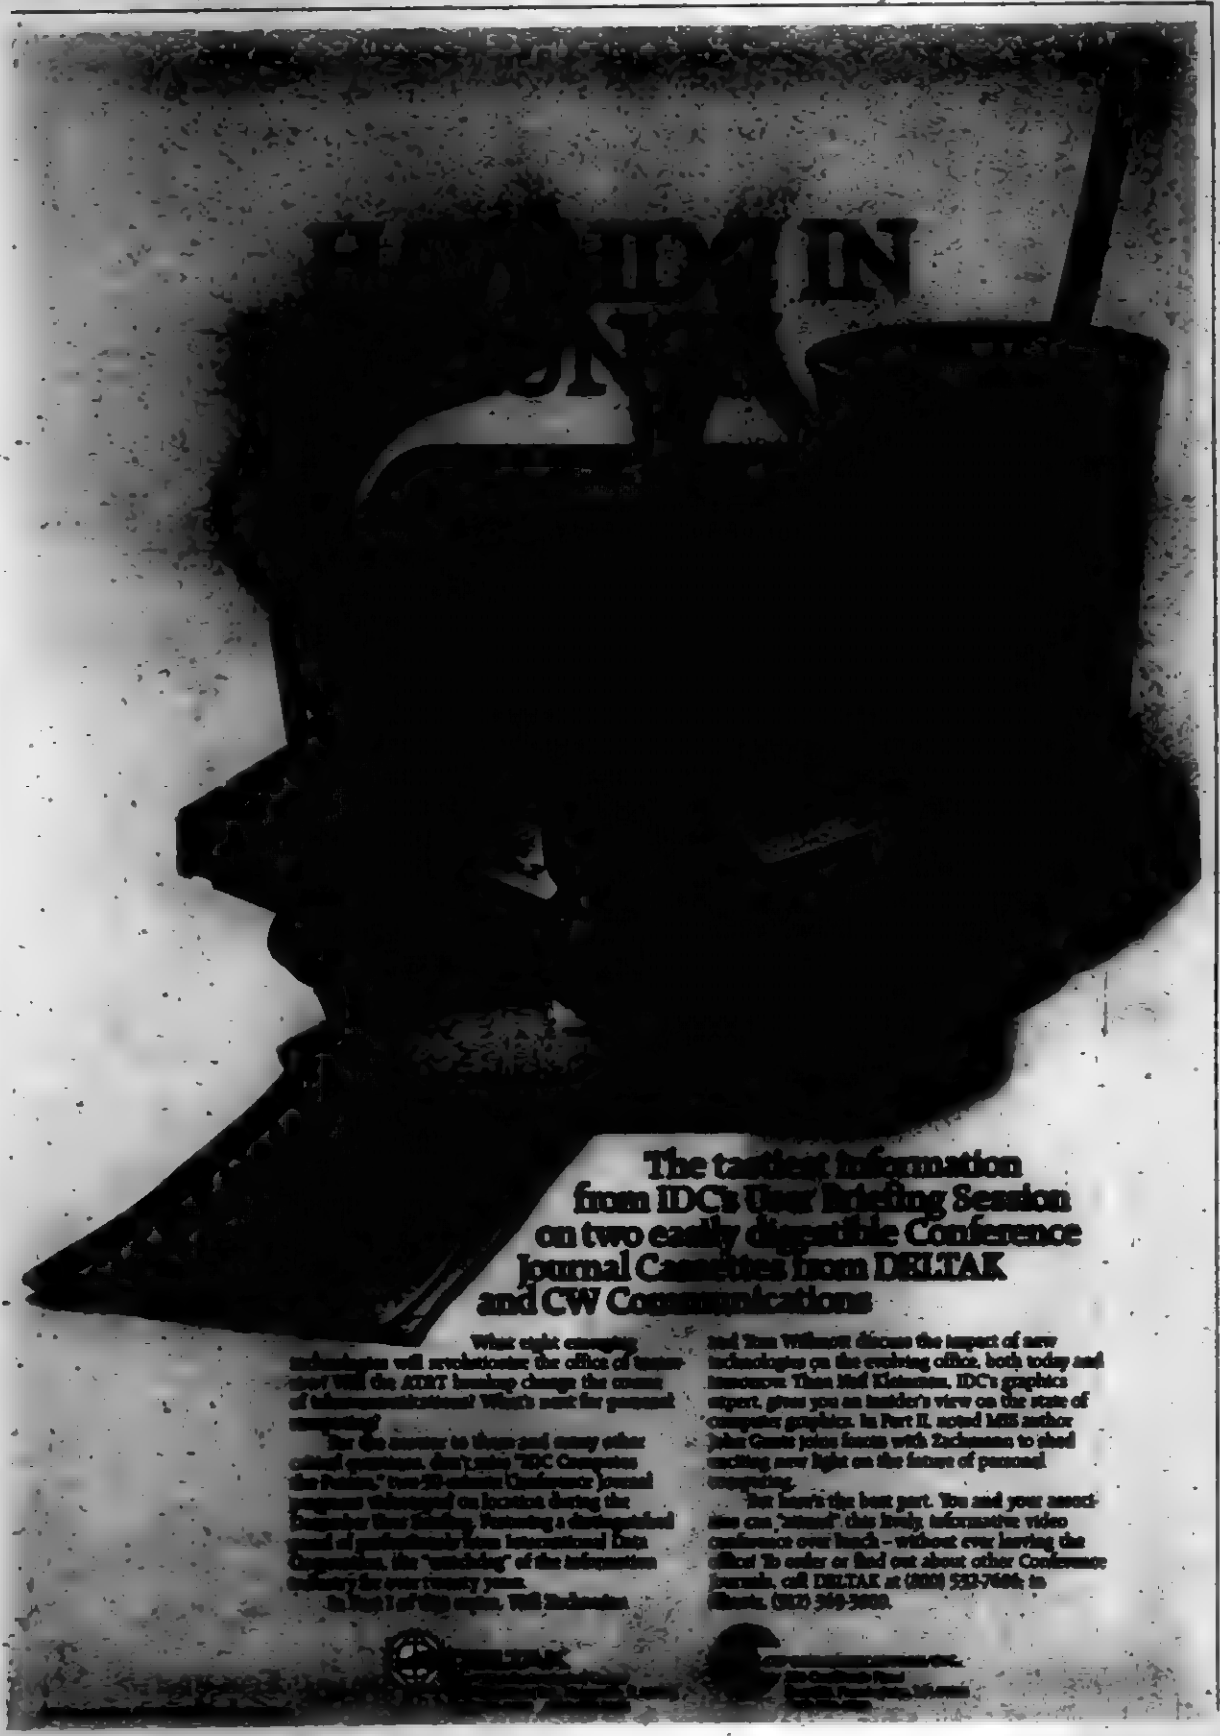
Dan E. Wright has joined Hogan Systems, Inc. as vice-president, applications software development.

■

Wayne Harvey has joined Oracle Corp. as director, corporate technical services.

■

Louis A. Kaplan has been named vice-president of human resources and **Lloyd Morgan** has been appointed vice-president of manufacturing at North Star Computers, Inc.



Compaq to cut micro prices

HOUSTON — In the wake of IBM's introduction of its Portable Personal Computer, Compaq Computer Corp. last week acknowledged plans to cut prices for its floppy disk-based portable micros.

A Compaq spokesman declined to discuss the size or the timing of the cuts. However, many dealers have slashed prices of the basic single-drive Compaq system from $2,995 to $2,495 and dropped prices for the basic dual-drive system from $3,495 to $2,995. The suggested price for the Compaq Plus, the vendor's hard disk portable system, is expected to remain stable at $4,995.

IBM introduced its portable micro in February with a suggested price of $2,795. It has not announced any plans for a hard disk version.

Kvamme joins venture firm

SAN FRANCISCO — E. Floyd Kvamme resigned recently from Apple Computer, Inc., where he had been executive vice-president of marketing, and subsequently joined Kleiner, Perkins, Caufield & Byers here as a general partner.

Formerly president of National Advanced Systems, Inc., Kvamme joined Apple in January 1983 and was responsible for worldwide marketing, sales, distribution and support of Apple's products.

Kleiner, Perkins, Caufield & Byers is a venture capital firm that specializes in high-tech firms. The firm has financed 85 companies, including Tandem Computers, Inc., Lotus Development Corp. and Compaq Computer Corp.

COMPUTER INDUSTRY

DEVELOPMENTS

Vector Graphics, Inc. has secured additional financing of $2,750,000 through a private placement of common stock at $1.50/share. The funds reportedly will be used to address working capital requirements.

■

Honeywell, Inc. and Formative Technologies, Inc. (Formtek) have signed a third-party service agreement. The contract calls for Honeywell's Customer Services Division to be the national service vendor for Formtek's computer-aided design workstations.

■

Lotus Development Corp. announced it is developing a Radio Shack TRS-80 Model 2000 version of its 1-2-3 integrated program, to be sold through Radio Shack Computer Centers. Shipments of this version of 1-2-3 will begin at midyear.

■

Data General Corp. and AT&T Information Systems, Inc. announced an agreement to develop a communications interface to enable DG's Comprehensive Electronic Office workstations and Desktop Generation systems to connect with Eclipse MV/Family systems through AT&T's Digital Multiplexer Interface Dimension System 85.

■

Aquix Advanced Systems Corp. acquired North American marketing rights to the multiuser microprocessor-based storage systems developed by Ehcot Computer Systems, Inc. The agreement also gives Aquix nonexclusive marketing rights for these systems throughout Central and South America as well as Europe.

■

Data General Corp. has formed a full-service marketing unit, which will focus on marketing peripheral equipment, software, terminals, low-end workstations, system upgrades and spare parts.

■

Digigraphic Systems Corp. has acquired the product marketing and manufacturing rights, as well as the customer base, of Magna Technologies, Inc. Terms of the agreement were not disclosed.

■

Computer Technology International (CTI) has signed a letter of intent with Datel Systems Corp. to provide management services for the New York City firm. The agreement will also provide CTI with an option to purchase controlling interest in Datel.

■

Digital Equipment Corp. and Dest Corp. reached an agreement to enable Decmate II users in small businesses and large organizations to add a high-accuracy optical character recognition capability to their offices. As part of Digital's agreement, Dest is also offering a format processor.

■

The Quarter-Inch Cartridge Drive Compatibility working group reached an agreement to develop proposed standards for the 100M-byte tape cartridge streamers at its next meeting on April 5-6.

■

Computervision Corp. and Prime Computer, Inc. announced an agreement under which Prime will purchase joint ownership of Revision 4 of the Medusa software package from Computervision. Both companies will be able to market Medusa worldwide as of June 1.

■

Genstar Corp. and Gather Computer Corp. have agreed to market jointly an integrated line of executive workstation software products. Designed to provide rapid access to diverse business information, the product line runs on office hardware manufactured by Convergent Technologies, Inc.

AKERS from page 97

said.

Noting that IBM has grown at a faster rate than the industry overall for the past two years, Akers said, "I think the strategies that are the IBM strategies are working, and they are working well and continuing to pay off for our stockholders."

Akers

Akers cautioned against "Personal Computer myopia," noting that while the Personal Computer line of products has enjoyed great success, it is "still a relatively small, but fast-growing, part of IBM."

IBM's continued success depends on many business areas and industry segments, he said. "We fully expect large processors, storage devices, other workstations and office systems, telecommunications products, peripherals and software to carry their fair share of IBM growth," he added.

Software sales growth, according to Akers, will considerably outpace hardware sales growth over the long term. While software only accounted for 6% of total revenues in 1983, over a five-year period it has achieved a compound growth rate of 42%, he said.

IBM set very high goals for this year, according to Akers, and so far this year, the company is ahead of those goals. "We have been pretty busy so far [this year], and we will continue to be very busy with new products throughout the rest of 1984," he said.

FACE THE REAL COST OF DIVESTITURE!

Oki Semiconductor, Inc. announced the opening of its first design automation center in the U.S. The new design center is reducing turnaround time and costs.

■

The U.S. Bankruptcy Court has set April 11 for a confirmation hearing on the plan of reorganization filed by Threshold Technology, Inc., which has been operating under Chapter 11 since November 1982. The plan of reorganization includes an agreement with Siemens Capital Corp. for settlement of its claims, which represent 72% of Threshold's pre-Chapter 11 debt. Pending confirmation of the plan, company officials said that Threshold will seek funds from private and public sources.

Unidata Systems, Inc. announced that, effective March 9, Unidata will change its corporate name to Systems Assurance Corp. The company's Nasdaq trading symbol (formerly Udat) will become Syss.

■

Exeter Corp. announced an agreement to open a plant for the design, development, manufacture and marketing of computer peripherals in Coolock, Ireland, this fall.

■

Siemax Corp. announced the formation of Pedalogic, its new corporate data processing training division. Pedalogic will offer major corporations a full range of individually designed programmer, analyst and management courses.

■

Computer Consoles, Inc. (CCI) announced a distribution agreement with Standard Telephones & Cables Ltd. for CCI's office automation systems. The agreement is for $6 million over the next 18 months. Total value of the agreement, pending all options over a four-year period, is in excess of $63 million.

■

Storage Technology Corp. has chosen Storagetek as its new trademark, which will gradually replace STC. The company name, however, will not change.

■

Universal Supply, Inc. announced confirmation of its Chapter 11 plan of reorganization on March 1. The Canadian Commercial Bank agreed to provide the company with a new line of credit, enabling the company to resume normal operations. The new board of directors includes William M. Crilly, president; Douglas J. Lehrmann, vice-president of finance and administration; James M. Allen; Roy Queen of General Instrument Corp.; an unannounced representative of Canadian Commercial Bank; and a sixth board position to be shared by Paul C. Jain, vice-president of market and product development, and Arvind B. Patel, the original founder of the company.

■

Tymshare, Inc. has combined its Transaction Services Division and Telecheck Services, Inc. Division to form the Tymshare Payment Services (PMTS) organization. Jeffrey Baer, previously manager of Telecheck, has become a Tymshare vice-president and general manager of PMTS.

DEC from page 97

Those restrictions, effective Feb. 29, resulted in the renewal of DEC's bulk export license for only two months, rather than two years, and the requirement that DEC obtain individual export licenses before shipping computer equipment to the three named European nations.

A Commerce Department spokesman declined comment on the case, noting that "all information regarding a company and the Export Act is considered confidential."

DEC reportedly is the only company currently operating under the restrictions, although industry observers noted that several major companies are due for license renewals in the coming months.

DEC spokesman Richard Berube said that the Commerce Department may have taken its action because the November seizure of VAX-11 equipment in West Germany and Sweden occurred while the government was — and still is — considering tighter high-tech export controls.

The equipment confiscated in Europe included a VAX-11/782 dual processor that the government considers valuable for military applications and allegedly was intended for shipment to the Soviet Union. The equipment was returned to the U.S. and was impounded by the U.S. Customs Service.

The restrictions, according to Berube, also call for DEC to provide the government with details about all of its overseas customers for the VAX-11 family, including information about how those customers plan to use the equipment.

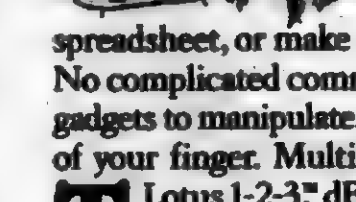
Berube said there is no reason to believe the restrictions will affect the company's earnings, and that, while the Commerce Department has sent some license applications back to DEC for further information, no licenses have been denied. He said the license process has taken about a week.

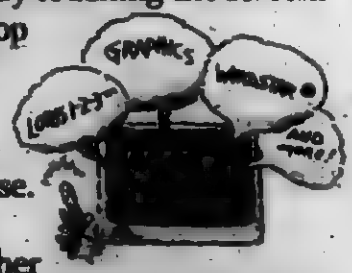
The company reportedly was surprised by the Commerce Department's actions because DEC had cooperated with federal agents in the November seizures. Published reports have suggested that the Commerce Department may have used against DEC some of the information the company had provided the department during the firm's cooperative efforts.

But Berube noted, "We want to continue to cooperate with Commerce because better export controls are in everyone's best interest."

Is your office operating at a crawl...

Maybe the one thing you need to get off the ground is the Touchscreen Personal Computer. The HEWLETT-PACKARD 150. Because it's no ordinary machine. Remember the first time you approached a personal computer? If it wasn't exactly love at first sight, it was probably because a lot of machines can be pretty intimidating. Especially for first-time users. We've made the Touchscreen Personal Computer so easy to use that people like to use it. Very simply, we've taken out the intimidation factor. We've made the new Touchscreen Personal Computer so easy to operate that even first-time users can use it. Which means they'll quickly grow to love it. For example, to select the software you want to use, just touch the screen. So whether you want to work with words, numbers or graphics, all you have to do to get started, is touch the screen. And once you get going, you can change a number in a spreadsheet, or make a chart for a presentation just by touching the screen. No complicated commands to remember. No desktop gadgets to manipulate. All that's required is the touch of your finger. MultiPlan,™ Graphics, WordStar,® Lotus 1-2-3,™ dBase II,™ VisiCalc® and a world of popular software become easier than ever to use.





The Touchscreen Personal Computer not only communicates with people. It communicates with other computers, too. Your people are your most valuable asset. But the more information they have at their fingertips, the more valuable they become. The Touchscreen Personal Computer delivers again.

Automatix report falsified

BILLERICA, Mass. — Automatix, Inc. said recently it dismissed an employee in its Paris office after auditors discovered a falsified purchase order and that related changes in accounting practices are expected to require a restating of 1983 quarterly reports and result in a loss for the year.

The company, a manufacturer of robotic systems, said its outside accountants, Price Waterhouse & Co., discovered the falsified purchase order during an audit of Automatix's 1983 results. The Paris employee, a manager, reportedly mistakenly booked an order that was actually a trial order and when asked to submit documents for the audit, decided to try and falsify a report.

While only one falsified purchase order was discovered, Price Waterhouse advised the company to alter its policy of revenue recognition by which sales are recorded.

"The company therefore expects that, to the extent that 1983 revenues are in fact reduced, in significant part the same transactions should be reflected as additional company revenues in 1984," a company spokesman said.

The company reportedly generated $2 million in sales activity during 1983, and the falsified report covered an amount of $120,000.

STRATEGY from page 97

than software vendors, and its strategy is aggressive pricing of high-functionality boxes.

Using a mixture of Personal Computer XT, 3270 Personal Computer, Personal Computer XT/370, portable computers and PCjr products, Big Blue is attempting to saturate the professional, administrative, scientific, production, data processing and secretarial work places, he claimed.

"IBM wants to wrap up the corporate account from the professional's office through the engineering center to the secretarial workplace, and today's product line is only the tip of the iceberg as far as IBM's technology is concerned," he said.

Smith predicted that Big Blue will introduce more proprietary technology into its workstation products. Its objective, he claimed, is to maintain control over access to the user's host computer and to use proprietary software and/or semiconductor devices for special functions.

Looking at possible future products from IBM, Smith forecast the emergence of a more sophisticated XT/370 workstation containing 0.4 million instructions per second and costing between $40,000 and $60,000.

"It will house IBM chips and in essence will be the 370 architecture on a desktop," he predicted.

Smith said he also expects to see the introduction of an intelligent secretarial workstation from IBM. Such a product, he contended, is immensely important to Big Blue's future office systems strategy.

The analyst also predicted that IBM will implement an "umbrella" software strategy to integrate diverse products and maintain compatibility with its existing PC-DOS base.

This, he maintained, will ensure a stable development environment for software vendors. "Unix is one of several operating systems that IBM will offer in an attempt to bridge users to its new type of 370 architecture," Smith claimed. However, "PC-DOS and VM are more strategic than Unix right now. It will be the 370 and its future derivates that are going to form the guts of IBM's workstation strategy."

Another speaker, Burton Grad, president of Burton Grad Associates, Inc., an Elmsford, N.Y.-based consulting firm, placed more emphasis on the importance of Unix to IBM.

The Bell Laboratories operating system, he asserted, offers a mechanism for providing a coherent strategy covering IBM's broad product lines.

"One possible scenario is that IBM will develop a coherent set of Unix systems covering everything from the Series/1 machine up through the 4300 range that would enable users to write applications as if these different systems really did talk to each other," Grad suggested.

Unfortunately, he added, it is too early for software service vendors to place their bets, and he advised them to sit tight and await IBM's announcements before committing to a particular course of action.

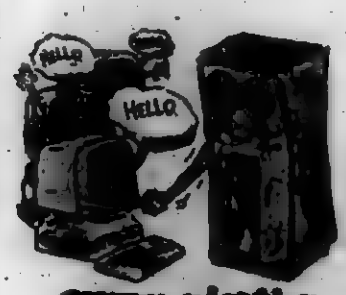
IBM from page 97

expected product is so late. He replied, "I suppose anything announced by IBM is either announced or a mystery. We were 'late' with the [Personal Computer] for many years, and nobody is talking about that."

Another interesting comment about local-area networks came from Entry Systems President Phillip D. Estridge, who said the Personal Computer cluster products are good communications devices, but, "We think it's not a [local-area network]. You'll find, however, that it's a lot of what you thought a [local-area network] was."

The comments by the IBM chiefs might be interpreted to mean that IBM's local-area network is going to be one expensive product for businesses to justify as an investment and that maybe a lot of people will be told they can do things a lot cheaper with the cluster products.

when it could be flying?



communication

The HP 150 is fully compatible with the big HP 3000 computers and, with the addition of our new 3278 communications capability, the 150 can talk to IBM® mainframes as well. Your people can call up data, work with it and send it back to the host computer. All this with the use of the keyboard. The HP 150 can also send electronic mail and operate a range of peripherals at workstations. Needless to say, this can really move things along. The Touchscreen Personal Computer is a Hewlett-Packard product. This, after all, could be the most important thing you need to know about it. Your professional reputation depends on the key decisions you make. Office automation is one of those decisions. You need to know and trust the company you go with. Hewlett-Packard's long-standing reputation for excellence is a given in the industry. And our service and support will make sure you aren't standing still when you should be flying. See the HP 150 at your local dealer or for information call (800) FOR-HPPC today. Find out how a personal computer with a sense of touch makes a lot of sense for your office.

HEWLETT PACKARD

POSITION ANNOUNCEMENTS

Join The Team That Created The Elegant NS16000

An elegant approach led to a very elegant solution — National's NS16000 microprocessor and its product family. The revolutionary top-down architecture delivers 32-bit power, and memory management capabilities on par with the latest mainframes. The upward-compatibility will accommodate a shift from 16- to 32-bit hardware. In essence, the NS16000 performs more like a computer than a chip, and we think that's a very elegant package.

A "Software-Intensive" Effort.

The NS16000 microprocessor is the spring-board for an entire family of products currently being developed at National's Microprocessor Systems Division. The key to their success lies in the development of software that enhances the NS16000 family's performance, applicability, and elegance. From development through marketing, our "software-intensive" effort is rapidly gaining momentum as we develop demand-paged UNIX™ systems based on Berkeley 4.1bsd and 4.2bsd for National's NS16032 and NS32032 microprocessors. We are also working with Bell Labs to define a version of SYSTEM V, . . . ,etc, for NS16032 and NS32032. These developments are creating opportunities for software professionals with UNIX and IBM PC™ experience to join us in the following areas:

Compiler Development

You will be involved in developing compiler code optimizers for "C", Pascal, FORTRAN, etc, to take advantage of the NS16000 elegant architecture. Your background should include two to five years' experience in compiler development; UNIX experience is desirable.

UNIX Kernel Development

You will work on porting Berkeley 4.2bsd to NS16032 and NS32032 based microcomputer systems (including a popular PC configuration with NS16032 and NS32032 add on boards). Two to five years' experience in UNIX kernel development is desired.

The Rewards Of Elegance.

The elegance and power of the NS16000 will become evident as more software is developed for it. And those who develop that software will reap the rewards, personally and professionally. That's definitely something to think about if you're ready to take on the challenge of our opportunities.

To learn more about National's Microprocessor Systems Division, send your resume to National Semiconductor, Dept. MS, P.O. Box 62499, Sunnyvale, CA 94088. We are an equal opportunity affirmative action employer. Principals only please.

NS16000

Elegance is everything.

POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS

If you recognize quality as quickly as the KLA 2020, you're already reaching for your resume.

The KLA Model 2020 automatically completes macro test inspection of a wafer in about 5 seconds, and micro inspection in less than 1 second per field-of-view. That makes the 2020 a revolutionary process control tool for wafer printed VLSI circuits.

Despite its impact, the 2020 is simply the latest in a long line of exciting inspection equipment from KLA. We're the leader in automated image analysis, and listed by Inc. magazine as one of the fastest growing companies in the United States. Our employees also have an eye for quality — 80% of our original workers are still with us almost 8 years later. Consider these opportunities to join us.

Software Engineering Managers

Lead a group of 4-6 software engineers in developing software for our new automatic wafer inspection product. This system includes software for image processing and control based on 68000, our own bit slice and pipelined processors, and a multiprocessor control system. Requirements include a MS in EE/CS/Math and 6 years of software experience. Experience in Computervision/ image processing is preferred. Management experience is not necessary.

Software Engineers

You'll work on pattern recognition, automatic control, and algorithm development, using PASCAL, "C", microcode or assembly language for a variety of processors including 68000, 2900, 8031. Requirements include a BS in CS/EE/Math (MS preferred) and 2-4 years' software development background, high level language and assembler experience. Some hardware knowledge would be useful.

Applications Engineers

You'll join our new division, formed to develop a modular product line of pattern recognition and image processing systems. Your primary responsibility will be to apply image processing software techniques as well as provide technical support to customers, which involves developing and presenting proposals, performance specifications, cost estimates and schedules. You will also conceptualize, implement and demonstrate prototype designs, write and present technical papers, and support marketing and service documentation development. Requirements include a BS/MS in EE/CS/ Physics, and at least 4 years' experience as a process or manufacturing engineer in the semiconductor industry. You should be an aggressive, self-starting individual with an ability to understand and utilize various opto-mechanical components associated with image illumination and acquisition.

Take a look at KLA, the company with an eye for quality. We offer an excellent salary and benefits package that includes a company profit sharing and stock purchase plan. Please send your resume to: KLA Instruments Corporation, Attention: Terri Rose, 2051 Mission College Boulevard, Santa Clara, CA 95054. Or call, (408) 988-6100. We are an equal opportunity employer.

CICS SYSTEMS PROGRAMMER

HAMMERMILL PAPER COMPANY, a leading producer of paper and allied products, has an immediate opportunity in its Erie Corporate Headquarters.

The successful candidate will have 3 - 5 years systems programming experience in an OS environment with a thorough knowledge of CICS implementation, internals, problem determination and resolution. Exposure to IMS, SMS, and on-line accounting monitors very helpful.

The incumbent would become a member of an expanding technical services department and would be coordinating the planning, installation, maintenance, tuning and support of a CICS environment.

Our current MIS environment consists of IBM 3033/3081 multi-CPU, shared DASD, VM/MVS operation with SMS, CICS, and OS/VS1. In addition, technical services supports Information Center products, i.e., FOCUS, ADRS, SAS, etc.

Our up-to-date facilities and equipment offer a stimulating work environment and an opportunity for career growth. If you are a qualified professional seeking a career change for the better and wish to participate in a superb internal working environment, you are invited to submit your credentials, including salary history and requirements, in strict confidence to: Mr. J. Michael Stephens, Manager, Corporate Staffing & Development/HAMMERMILL PAPER COMPANY/ P.O. Box 1660/Erie, PA 16533.

Hammermill Paper Company
Erie, Pennsylvania 16533

An Equal Opportunity Employer

SENIOR PROGRAMMER/ANALYST

Progressive medium sized manufacturing company has an immediate opening in information services department for a senior level programmer/analyst to design, develop and maintain systems necessary to support all business functions within the company.

Minimum 3 years heavy experience in COBOL in an on-line data base environment with specific experience in financial and/or manufacturing applications.

Prefer 4 year degree with major in computer science. IDMS/DC experience desired but not required. Salary DOE. Call or send resume to:

Dallas Industrial

NO TELEPHONE CALLS, PLEASE

"Whatever It Takes."

Brian Bish began working for Cincom Systems in 1977 as a programmer. Initiative and sound thinking have served Brian well. Today he is a Cincom Technical Service Center Manager and an authority on the support and service of leading edge software products. From a recent interview here are Brian's thoughts on support, software and a career with Cincom Systems.

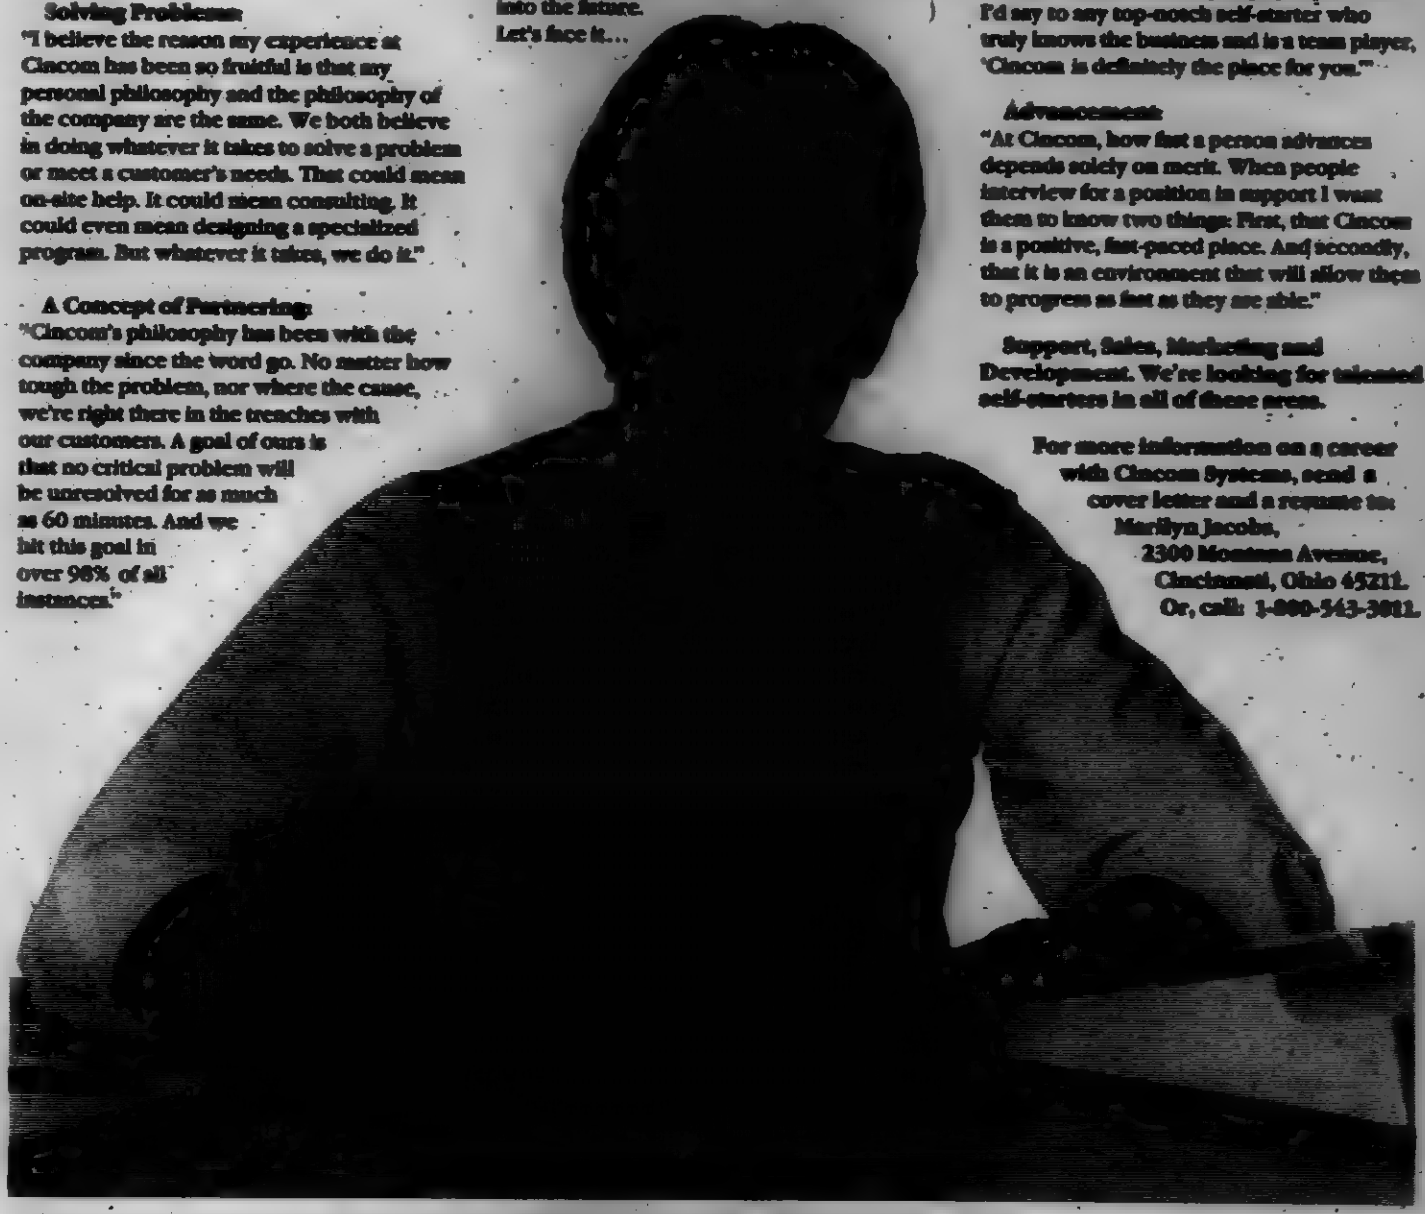
The Role Of Service And Support:
"Bottom line, the role of service and support is to help Cincom's customers become more successful. As our customers become more successful, Cincom becomes more successful."

Solving Problems:
"I believe the reason my experience at Cincom has been so fruitful is that my personal philosophy and the philosophy of the company are the same. We both believe in doing whatever it takes to solve a problem or meet a customer's needs. That could mean on-site help. It could mean consulting. It could even mean designing a specialized program. But whatever it takes, we do it."

A Concept of Partnering:
"Cincom's philosophy has been with the company since the word go. No matter how tough the problem, nor where the cause, we're right there in the trenches with our customers. A goal of ours is that no critical problem will be unresolved for as much as 60 minutes. And we hit this goal in over 98% of all instances."

Leading Edge Technologies:
"Support people are like anyone else in the computer business; they thrive on challenge and they want to work with the leading technology. TS/®, ULTRA™, MANTIS™, MRP5™, MANAGE USER SERIES™, PC CONTACT™...these are some of the newest and most advanced systems in the software industry. And these are the products our people are working with everyday. By working with challenging, leading edge products, people develop a strong personal commitment to leadership and to quality."

Excellence in Software Technology:
"To me, excellence in software means having the sense to look beyond the present and into the future.
Let's face it...



the computer business is changing as fast as any business ever has. Anticipating a customer's needs takes vision. In my opinion, no one else comes close to Cincom's vision. That's why we are producing the truly excellent software technologies in our field."

People:
"I don't know about other software vendors, but at Cincom some of the most talented people in the company work in support. They have to. We deal with Fortune 500 companies who are striving to advance the state-of-the-art. Often we work directly with the top DP person within the company. So, our people have to be of the same top-notch caliber to be effective. Leading edge companies need leading edge people. And, I'd say to any top-notch self-starter who truly knows the business and is a team player, 'Cincom is definitely the place for you.'"

Advancement:
"At Cincom, how fast a person advances depends solely on merit. When people interview for a position in support I want them to know two things: First, that Cincom is a positive, fast-paced place. And secondly, that it is an environment that will allow them to progress as fast as they are able."

Support, Sales, Marketing and Development. We're looking for talented self-starters in all of these areas.

For more information on a career with Cincom Systems, send a cover letter and a resume to: Marilyn Jacobs, 2300 Montana Avenue, Cincinnati, Ohio 45211. Or, call: 1-800-543-3011.

HOME BANKING VIDEO TEX/ATM

Programmers Systems Analysts

Gesco is a major computer service and software development company servicing the financial industry. In the past 5 years, we have grown 5 times in size and we project a similar growth over the next 5 years.

Gesco is currently implementing a major EFT system using ACI's SOFTWARE to include bill payment, electronic mail, information display and financial transactions. The EFT hardware is a TANDEM based (non-stop ID system with microcomputers being used as the remote access client terminal.

Currently we are seeking SYSTEMS ANALYSTS with a minimum of 3 years experience including large systems feasibility studies and the development of detailed logical and physical system design. Experience in project leadership and utilization of a System Development Methodology highly desirable.

AND we are now seeking PROGRAMMER ANALYSTS with a minimum of 2 years TANDEM experience using TAL, ENSCRIBE and PATHWAY. Additionally, you should have DATA COM experience with SDLC and BiSync protocols. Experience with ATM large IBM mainframes and project management is a strong plus.

Fresno is just three hours away from the San Francisco Bay area and offers an outstanding educational system, climate and AFFORDABLE housing and relocation. We offer a competitive salary and benefits package.

TO BECOME A MEMBER OF OUR HOME BANKING/ VIDEO TEX PROJECT TEAM, immediately contact:

A.J. Newberne

DATA PROCESSING OPPORTUNITIES

Continued company expansion requires the addition of new professionals to our Data Processing Department. We're looking for people attracted to a dynamic manufacturing environment. Current system is IBM 3083-E16.

MANUFACTURING PROGRAMMER/ANALYST
Job #PLC-389

Responsible for analysis, design and programming of company manufacturing systems. Requires 2 years experience in MRP, MPS and inventory control applications. Knowledge of VSAM, CICS, COBOL or ASSEMBLER, DOS/VSE preferred.

APPLICATION PROGRAMMER/ANALYST
Job #PLC-388

To replace a transfer to our new Computer Services group, this position is involved with varied applications. Performs analysis, design and programming activities. Requires 2 years IBM experience with COBOL, CICS, VSAM.

Consider what Valmont offers:

GROWTH...new challenges, business opportunities lie ahead. Valmont is a company engaged in industries as diverse as transmission structures to computer services. Our 1983 sales were 194MM. We're a Fortune 1000 company and world's leading manufacturer of center pivot irrigation equipment but also produce and market lighting standards, transmission structures, tubing, financial services, insurance products, and a newly formed computer services business.

COMPETITIVE COMPENSATION..."comprehensive" best describes our package which includes employee savings program, insurance (medical, life and dental), retirement, educational reimbursement, internal job bid, paid holidays and vacation, modern cafeteria, plus relocation assistance. We recognize and reward our employee's contributions through a supportive performance appraisal and salary review program.

MODERN FACILITIES...exceptionally comfortable, quiet and modern surroundings designed to maximize productivity.

VARIED APPLICATION...manufacturing, marketing, accounting, finance, human resources, engineering, insurance, to name a few. Opportunity to develop many skills in varied applications.

If you're interested in pursuing a career with a rapidly expanding and diversified company, we invite you to take the next step. Write or submit your resume with salary requirements to: Vanessa Brown (Please refer to Job #)

NORTHROP ADVANCED SYSTEMS DIVISION...

THE FUTURISTS

(Southern California)

The futurists of Northrop's Advanced Systems Division in Southern California are directing their computer skills beyond the present and into the next century of aerospace. If you've got the ability and desire to glimpse the future in your discipline, you can participate side by side with the finest minds in the aircraft industry within our newest facility in Pico Rivera. Examine the opportunities listed below and join the futurists.

Network Communications

Need individuals with experience in maintenance and installation of computer hardware in a large IBM environment. Assignments involve troubleshooting problem hardware, designing hardware networks, assessment of comprehensive plans for installation of computer hardware and actual installation of various types of standard and graphic devices and minicomputers for business and scientific applications. Knowledge of ASYNC, BISYNC and SNA/SDLC protocols is expected.

Capacity Planners

Performance and tuning systems programmers with experience in tuning I. O. configurations job mix with heavy MVS. Familiarity with reporting techniques, graphical representation and SAS, as well as performance experience with Omegamon, SMF and RMF is required.

IMS Systems Programmers

Must have thorough knowledge of the IBM installation procedures for program products and other software that relates to IMS. Knowledge of ACB, PCB and complete SYSGEN process is required. Successful candidates will provide assistance to programming personnel related to procedures and policies of IMS.

Network Design Specialists

Must be experienced in design and analysis of 3705 FEP, and 3274 CU's in various configurations using SNA in a large IBM environment running JES 2 VTAM/TCAM. A working knowledge of ASYNC, BISYNC and SDLC diagnostic equipment in extensive on-going data testing and hardware feasibility studies.

Sr. ILS Systems Analysts (Scientific)

Must be capable of developing information systems requirements as well as estimating and documenting scientific oriented computer applications. Requires experience with a variety of modeling applications such as: maintenance data, maintainability, reliability, availability, cycle cost, etc. Must have 5 or more years recent military aerospace experience in one or more of the above. A BS/MS degree is preferred.

Data Base Analysts/Designers

Several new positions are available including Data Base Design, MP and BMP processing support, DB, traditional IMS and newer relational, DB, products, IBM Data Dictionary automation and support, IMS Control Block (DBD, PSB, ACB) Generation. Other opportunities include the responsibility of evaluating DBMS related software, develop recommendations for advanced technical processing to upper management, as well as provide assistance to End Users, Requirements Planners, Systems and Programming Analysis and other DP duties. Experience in IMS Data Base Administration and/or design with a background in IMS on-line and/or Batch Message Processing required.

Data Processing Equipment Configuration Specialists

Your responsibilities will include equipment evaluation, acquisition recommendations, configuration design, installation planning, terminal and control unit installations, site facilities planning, and equipment and facilities inventory tracking.

Computer Systems Technical Writer

Will develop documentation required for the development and implementation of business and scientific systems and models. Will ensure that all documentation is of high quality, meets commercial/military standards, reflects actual procedures/practices and is completed on schedule. Must have excellent oral and written communication skills. A BS/BA degree preferred. Previous ILS aerospace experience a plus.

Business Systems Programmers/Analysts

Will analyze and formulate system design solutions by coordinating with analysts and user personnel. IBM hardware must have IMS experience with emphasis in IMS DB/DC, COBOL, and other related software, ILS and Mark V experience a plus.

Responsibilities include designing, coding, testing, and implementing interactive business systems. Will work closely with requirements planners and system users. Requires a working knowledge of IMS, DB/DC, COBOL, and system design disciplines. Experience with Engineering and/or Manufacturing systems, and programming development productivity aids are a plus.

Systems Analysts

Will assist users of data processing systems and services (i.e. engineering, manufacturing, finance) in establishing and planning for systems requirements and in converting to the use of data processing systems. You will work closely with users in developing objectives for improving systems and in identifying potential of computers for resolving problems or meeting objectives as well as perform liaison between user and data processing organization during systems development and installation. You will assist in training of user personnel in system procedures.

Qualified applicants should have analytical and systems design experience (preferably in an aerospace environment) in one or more of the following areas:

Engineering

- Modeling and simulation, finite element analysis using NASTRAN for avionics and structures.
- On-line systems for administration (drawing/change control, specifications, structures).
- Computer Aided Design and lofting (CAD/CAM) for interactive graphics.

Manufacturing

- Manufacturing Engineering — Manufacturing Engineering applications, tooling, production planning.
- Industrial Engineering — Major instances, computation and data manipulation. MIL-STD 1567 & 1528
- Operations Control — Labor and tracking data collection, shop floor control, inventory management, automated warehouse, capacity planning, scheduling.
- Materiel — Materiel control procurement and materiel accounting.
- Facilities and Transportation — Request tracking, inventory, vehicle dispatch and tracking, equipment maintenance.

Finance

- Cash Management and Accounting — Payroll, general ledger, budgets and accounts payable
- Controller — Manufacturing technology as applied to controller, IMS, TSO and FORTRAN applications/development.

Selected candidates will receive excellent salaries and a wide variety of benefits. Please send your resume and salary history to:

Dave Coffey • Employment Office • Dept. 935
P.O. Box 1138 • Pico Rivera, CA 90660-0977

EDP Professionals

Middle South Services has one of the South's largest data processing centers serving one of the nation's largest power systems. Middle South Utilities, our parent company, is a major electric utility. Our hardware environment includes two IBM 3081s, and IBM 4341 and Tandem mini 16s. If you are a career-minded EDP professional, we have the following opportunities available:

(MVS) SYSTEMS PROGRAMMER We currently have an opening for a Systems Programmer with 2+ years experience in MVS operating systems. You will install, monitor, help problem solve, tune and assist in the installation of MVS/XA systems migration.

ANALYST/PROGRAMMERS (APPLICATIONS) Several positions are currently open for experienced IMS DB/DC Analyst Programmers. Experience with COBOL or PL-1 in plant maintenance or business applications is needed.

PLANNING ANALYST Will possess broad knowledge of new systems, hardware and software capabilities, applications development and analysis, and equipment evaluation technique. Requires understanding of computer cost studies, equipment configurations and timing out of systems. Experience in capacity planning or corporate utilization of personal computers is a plus. Additional assignments possible in areas of capacity planning, risk analysis, contingency or long range planning.

ANALYST PROGRAMMER You will use your 3 years of data processing experience along with your experience on the IBM Personal Computer to take on the responsibility of supporting our corporate PC objectives. You will assist and train the PC users, you will do hardware and software justification, configuration planning, installation, and problem diagnosis. This position requires good working knowledge of the IBM Personal Computer along with 3 years programming experience.

REAL-TIME SYSTEMS ASSOCIATE ANALYST Requires a minimum of 3 years of real-time computer system experience preferably in the electric utility industry with emphasis on power system operations and computer system operating systems. A thorough knowledge of design and programming methodology with experience on large real-time computer systems is desirable. Requires BS in Computer Science, Math or Electrical Engineering or the equivalent. Additionally, experience in computer applications as applied to system software and data base management programs is required.

Due to our size and scope of operation, we offer access for advancement, career stability and an excellent salary with major benefits. For more information, call our number below or to apply directly, send your confidential resume to Byron Heath or Richard Jackson, MIDDLE SOUTH SERVICES, INC., P.O. BOX 61000, NEW ORLEANS, LA 70161.

Data Processing Divisions

A network of Professionals To Service your Local or Relocation Career Desires.

SENIOR SOFTWARE ENGINEER
$40,000-$55,000
Be involved in sophisticated operating systems enhancements! Proficiency at UNIX/KERNEL level needed plus experience in 16/32 micros. Staff management is just a step away!

PROJECT LEADER QUALITY ASSURANCE
$35,000-$40,000
Have a lead in software development! Capitalize on your ADA, "C" and PASCAL on a VAX 750, 780. Be involved in database design, and simulation to process data for statistic analysis.

SOFTWARE ENGINEER FOR PROJECT MANAGEMENT
$30,000-$40,000
Top opportunity in the design and development of software for automatic test equipment. Capitalize on your VAX/VMS 730 - 780-05 internals. Develop software in PASCAL and ASSEMBLER.

SENIOR CLIENT FIELD REPRESENTATIVE
$35,000-$38,000
Variety plus opportunity for the person familiar with COBOL and IBM mainframes! Be the corporate troubleshooter involved with analysis and applications! There's project leader potential just around the corner!

NETWORK ANALYST COMMUNICATIONS DIVISION
$32,000-$38,000
Corporate liaison for implementation of X.25 networks. Deal with client management. Be in charge of orientation for users and support personnel. Ideal for the person who likes action!

A LEARNING EXPERIENCE SYSTEMS PROGRAMMER
$25,000-$40,000
There's a wealth of opportunity to learn a variety of IBM software! Build your expanding career horizon on your IMS DB/DC or your CICS! Management is here.

FINANCIAL SPECIALIST HOGAN PROGRAMMER
$28,000-$40,000
Be right in the middle of "Hands on" activity! Be involved with installation and modification of a HOGAN software package. Be in line to move to programmer analyst! Exposure to IBM 3033 OS/MVS with IMS ideal!

DATA COMMUNICATIONS MANAGER
$30,000-$40,000
Provide direct managerial support involving the design, installation of data communications equipment. Knowledge in banking area and electronics systems are good background!

MIS SUPPORT TO PROGRAMMING DIRECTOR
$30,000-$40,000
Large mainframe background coupled with management skills are the keys! Get involved in a systems environment in a manufacturing atmosphere! Rapid advancement for the "take charge" individual on the move.

FINANCIAL SYSTEMS SPECIALIST
$30,000-$35,000
An elite spot with the corporate manager of financial systems analysis. Be in on the design, implementation and installation of new systems. Use E.I.S., JDL, RAMIS and SAS languages.

V.P. OF SOFTWARE CORPORATE INNER CIRCLE
$70,000-$100,000
Ideal for the individual with multi faceted exposure on their rise through the ranks in data processing! Your current strong position in top management in MIS is an excellent qualifier.

MVS SYSTEMS PROGRAMMING
$30,000-$35,000
Five releasing opportunities that will broaden your career horizons! Move in as technical support and be in charge of the MVS systems! Take the step!

"THINK TANK" RESEARCH/DEVELOPMENT
$30,000-$35,000
Be a part of the corporate research team. Capitalize on your PLI and PASCAL real time! Be involved with total development of telecommunication applications. Key management here.

COMPUTER SCIENTIST
$30,000-$40,000
A unique opportunity for the creative thinker with DEC RSX/1TM hardware! Be involved in computer simulation and video graphics development for telecommunications! Major languages FORTRAN and MACRO! A management plum!

New 1984 Salary Data

No doubt, during 1983, you knew that many firms took a hard line on awarding salary increases—or, in some cases, even enacted across-the-board cuts.

Yet, on the other hand, did you know that salaries for *some* computer professionals *soared* right on through the uncertain business outlook?

Computer salaries are up.

The new, *1984 Computer Salary Survey and Career Planning Guide* is based on contacts with more than 44,000 computer professionals and 35,000 organizations. Not only are salary averages for fifty-eight positions reviewed (including ten new ones), but high and low compensation ranges are also provided.

Included are positions in programming, software, systems design, data base/data communications, Edp auditing, operations, computer sales, marketing, marketing support and management.

In addition, the new Survey details seven ways to maximize your chances of getting ahead through a proven, seven-step system that has helped thousands of computer professionals advance their careers.

Free to computer professionals.

The new 32-page Survey is available to you without charge. Since 1966, this annual report has helped approximately a quarter of a million computer professionals understand current trends in technology and compensation, realize how and where they fit in-and what they need to do to reach their full potential.

You owe it to yourself—especially if most of your career lies ahead—to call or write today.

Call today for your complimentary copy.

Call the Source Edp office nearest you for a free copy of our new 32-page report. We'll mail a copy to you in strict confidence, without obligation.

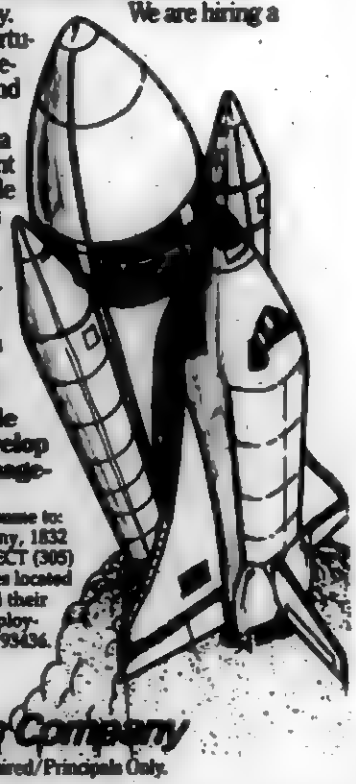
COMPUTER PROFESSIONALS

With Current Experience In Applications Software, OS/SW, Communications Networks, Compilers, DBMS and Development Tools.

We are now assuming our responsibilities as the Shuttle Processing Contractor for NASA at the Kennedy Space Center, Florida and the U.S. Air Force at Vandenburg Air Force Base, California. This six year contract (with options to fifteen years) will provide you with a secure opportunity to join the team of professionals like yourself who are making a significant contribution in the manned space program.

If you are an experienced computer professional whose goal is more challenging and rewarding work in a state-of-the-art environment, look to Lockheed Space Operations Company. We are hiring a number of professionals, like you, to fill opportunities involving the development and enhancement of: Applications Software (Real-time and Interactive), Operating Systems Software, Communications Networks, Compilers, Data Base Management Systems and Development Tools. You will be working on the Space Shuttle Launch Processing Systems (LPS), which is a highly distributed network of over 300 MODCOMP Super Mini Computers and a large number of Honeywell 6000's with over 3.5 billion bytes of mass storage. Some of these opportunities will involve a three month program to become familiar with the entire LPS and the space system unique OS/SW.



We also have opportunities available for MIS Applications professionals to develop a wide variety of on line Data Base Management Systems.

For immediate consideration call or send your resume to: Donald C. Quirk, Lockheed Space Operations Company, 1832 Garden Street, Titusville, Florida 32782. CALL COLLECT (305) 268-4870. Candidates who wish to pursue opportunities located at Vandenburg Air Force Base, California should send their resume to: Lockheed Space Operations Company, Employment Office, 1100 West Laurel Avenue, Lompoc, CA, 93436.

Tektronix Systems Programmers Are Making A Good Idea Better

Join us for an outstanding opportunity in the ideal living environment of Oregon. Our experienced Systems Programmers are involved in generating new codes, making improvements and making bug fixes to UNIX™ kernel, device drivers, commands, utilities, and network programs. Our primary focus is on the 4.2 BSD enhancements.

The individuals we're seeking must possess leadership potential in a UNIX™ environment, be highly skilled as a C programmer, have in-depth knowledge of UNIX™ internals, VAX and PDP-11 architectures, along with related peripherals. An advanced degree is preferable, but the equivalent in related experience is acceptable.

Tektronix is a Fortune 500 company that provides its professionals with competitive salaries, valuable benefits that include profit sharing, health and dental insurance, and liberal educational assistance. Oregon offers a natural unspoiled beauty, affordable housing, and unsurpassed outdoor recreation. All things considered, our future may coincide perfectly with yours. For immediate consideration, please send your resume to Michele Goza, MS 46-943, Tektronix, Inc., P.O. Box 500, ALI1, Beaverton, OR 97077.

We are an equal opportunity employer m/f/h.

UNIX is a TM of Bell Laboratories.

Tektronix
COMMITTED TO EXCELLENCE

COMPUTER PROGRAMMING INSTRUCTOR

Central Ohio Technical College is searching for a Computer Programming Instructor. This position is a tenure-track appointment. Position responsibilities include instruction, curriculum development, and student advisement. A minimum of a bachelor's degree is required; a master's degree is preferred, although appropriate academic or work experience may be substituted for the master's degree. Minimum experience and competency with data communications in business applications are also desired. Hardware in use is a PDP 11/70 running RSTS/E.

COTC, an autonomous 2-year technical college shares a 185 acre campus with The Ohio State University at Newark.

Salary for the 9-month position will be $18,000 to $21,600 depending on degree held and experience.

To insure consideration, please forward a resume and letter of application postmarked by April 13, 1984 to:

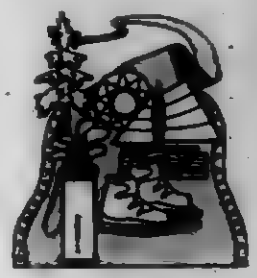
Personnel Coordinator
Central Ohio Technical College
University Drive
Newark, OH 43055

COTC is an EEO/AA Employer.

DATA PROCESSING EXECUTIVE

Minnesota Protective Life Insurance Company, a rapidly growing life insurance company, based in suburban Minneapolis, is seeking a highly qualified individual to manage its home office data processing department. This executive position, which should lead to Vice Presidency, is responsible for both data processing and for expanding the current Lilz/70 systems to accommodate the company's future growth. Applicant must have an excellent familiarity with life insurance operations and possess an extensive E.D.P. background including systems programming. Experience with Lilz/70 or equivalent application software conversion and operations is mandatory. This position offers an excellent starting salary and fringe benefits as well as a modern, comfortable suburban working environment. The growth potential of this position is limited only by the individuals energy and creativity. Interested parties should send resume to:

A. J. Yobi
Senior Vice President and Treasurer
Minnesota Protective Life Insurance Company
7801 Flying Cloud Drive
Eden Prairie, MN 55344



Watch your career evolve with the seasons

COMPUTER PROFESSIONALS

Just as the ever-changing seasons offer plentiful recreational options to the residents of our part of Southeastern Michigan, the stimulating variety of project work you will find at MIS will interest and challenge you.

We are a growing computer consulting company with a 15 year track record, providing professional support to a wide range of firms on a project basis. We offer an ideal-sized environment with more involvement and room for growth than is possible at a large company. Current requirements include:

- PL/1 or COBOL IMS DB/DC
- COBOL TSO/SPF/CICS
- TECH SUPPORT/SERIES I
- VSE/CMS
- IBM Systems Programmer
- FORTRAN/PASCAL/FMS/POS/RSX 11-M or VAX/VMS

Advance your technical skills and broaden your experience with us. We can offer you job stability, a generous salary and excellent benefits (including relocation reimbursement).

It's time to reach out for more. Make your change to MIS. For further details about current openings, call Personnel Recruitment or send resume to:

NDBS

You Decide.

If you want opportunity and challenge, the choice is Tandem's Software Development Team.

We pioneered the field of fault-tolerant computing. And, with our new TXP™ system, we've taken on-line transaction processing further than anyone had imagined.

As careers go, however, what makes Tandem different—and, we believe, better—is that we support the notion that the essence of success in our business is founded in opportunity and challenge for each of us.

Data Base Management

Relational Data Base Management

Requires 3+ years' experience in relational data base management systems development to contribute to a new project, and an understanding of query processing, various data access methods, data description and data manipulation concepts. Implementation experience with architectural design and distributed DBMS.

Application Development Tools

Design/implement high-level application development tools in the areas of application specification and generation, non-procedural language design, human engineering and ergonomics.

Diagnostic Technical Leader

Design/specify the maintenance and diagnostic architecture, design methodology and diagnostic tests for support of distributed fault-tolerant systems. MSCS/MSEE and previous project management experience desirable.

Quality Assurance

Software Product Quality

Experience in the design/implementation of quality computer systems. Use your analytical and creative abilities to influence product design, implement test tools and develop regression test libraries in data base management, operating systems, data communications and compilers.

QA Tech Leader

Lead a group building quality into new system software. Write test programs, design a regression test system and develop a release control library system. Sound knowledge of data base management software, software reliability and operating systems.

Operating Systems

Positions involve detail design, implementation and debugging skills, substantial operating systems development experience, and excellent writing and verbal skills:

Disk Access Method and Transaction Management

High-level design skills. Experience with file systems, access methods, device independent I/O, locking, failure recovery, transaction management.

Data Communications

Develop and enhance software from link level protocols to access methods. Projects involve LAN, ADCCP, SNA, SDLC, HDLC, X.25 and networking.

Processor Microcode

Design and develop processor instruction set and I/O channel microcode, participate in microarchitecture definition. Requires 3+ years' experience developing instruction set firmware or related hardware design.

Call Joy Mar COLLECT at (408) 725-5097 for more details about these positions, and about our 6-week paid sabbaticals. Or send your résumé to her attention, Tandem Computers Inc., Dept. 3/1, 19333 Vallco Parkway, Cupertino, CA 95014. We are an equal opportunity employer.

Principals only, please.

$80,000/YR. — CICS PROGRAMMING

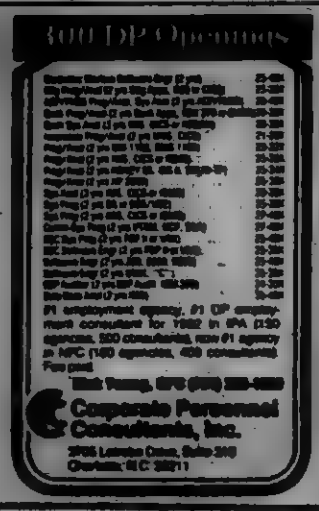
Acquire one of the most demanded & rewarding programming skills in months instead of years. A complete & guaranteed guide to CICS Command Level Programming. It's based on CICS latest release 1.6, written in COBOL, with tested examples on VS/COBOL. Broad-base 2nd edition, completely updated in here orders, hardcover, over 700 pages. Shows you how to use all CICS commands, 15 complete CICS programs explained, all major CICS functions. Covers: Interactive Debug, Add, Update, Delete, Browsing, Multi-record display/update, Print Shell, Abnormal, or step-wise report, Message Routing, Screen Formatting, VSAM Alternate Index design, setup and handling, Dynamic table manipulation, Audit Trail collection and more.

It's hard to believe the learning can be so easy until you try it. In hours you can start creating basic output. In days, you can start writing Pseudo Conversational CICS programs. It's not your learning curve at least in half; many programmers report even greater saving. Some CICS techniques are especially hard. When you're stuck for the hundred problems, you'll be thankful you have this book. All CICS techniques and problem areas are thoroughly covered. You'll find the topics on Protection shared handling, Test system debugging, Dump reading, Trace table usage, CSDF monitor, CSMT, CSNT commands, CICS internal tables setup & effects on application programs, Terminal Paging commands, complete procedures to install a CICS transaction and more. Why spend hours searching for the right techniques — when this book gives them to you already written.

Consulting will be the trend of the 80's for CICS due to great shortage of experienced CICS programmers. An average CICS contract programmer makes $30k-$40/hr. Some CICS consultants even make $100/hr (1040 Determination). Become one on CICS projects is very rewarding. A typical 10-person CICS project can make $10,000-$20,000 each week. This book contains 71 pages of tips on consulting that have to market your services, locate the right clients, write a proposal, resolve problem, quote the right prices to land consulting firms and draw a contract agreement without a lawyer. Written proposal & sample contract agreement are included for your convenience.

How much is this book worth to you? It's hard to say until you try it. That's why we want you to use it for 10 days. If you're not completely satisfied, simply return it at our expense for a prompt full refund. Fair enough? Thousands of copies have been sold. Over 90% of programmers who bought this book are satisfied with it. See how much time it saves you. How it leads you to the gold mines of programming. This book will pay for itself over and over, year after year. Act out now. Send $34.95 for 1, $59.95 ea. for 2, $27.95 ea. for 3, $55.95 ea. for 4 & over (plus $2.00/copy for P&H) in stock or M.O. to: CCG Online Systems, P.O. Box 78755, Dallas, TX 75378. Allow 1 to 2 weeks for delivery.

300 DP Openings



#1 employment agency. #1 DP employment consultant for 1982 in IPA (130 agencies, 500 consultants), now #1 agency in NFC (160 agencies, 400 consultants). Fee paid.

The Life Insurance Company of Virginia has executive openings for individuals who are eager to keep pace with the fast growing computer industry in insurance applications.

LOV's Information Systems Division currently processes life, health, and group insurance and annuities applications in a large IBM mainframe environment featuring LIFE-COMM and CAPS software packages. Data General minicomputer and microcomputer hardware and software support home office and field office automation requirements. Local and remote communications have been designed to complete the integrated LOV network.

We are proud of our accomplishments and invite you to consider joining our growing organization of data processing professionals. These opportunities carry attractive compensation with exceptional, excellent working conditions, and other fine benefits.

If you are interested in significant challenge, forward your resume, with current salary, to: Richard P. Johnson, Senior Personnel Associate, Life Insurance Company of Virginia, 6610 West Broad Street, Richmond, Virginia 23230. Principals only please.

Accountemps puts the pro in edp PROductivity.

There's no longer a reason for data processing work to fall behind—Accountemps professionals are available on a moment's notice. Specialists in systems analysis, programming, computer operations, data entry and even word processing.

Accountemps specialists are the ideal solution when work starts to pile up—when employees are sick or on vacation—or when specific projects must be completed quickly and cost effectively. And because they're slightly over-qualified, they need little or no orientation. They get right to work and finish the job right the first time—and quickly too.

A call to any one of 80 offices in the United States, Canada and Great Britain will bring you the help you need immediately—for a day, a week, a month or longer—whenever you need them—evenings or weekends.

accountemps.

Imagine

life in the fast-or-slow-as-you-make-it lane.

Then do more than imagine. Experience it. At Motorola's Semiconductor Products Sector — the world leader in the Research/Development and Manufacture of microelectronic components and systems. We're creating the trend-setting technology of tomorrow. In a location that is close to ideal — Phoenix, Arizona. Offering the recreational and cultural options you deserve . . . minus the crowds and chaos you'd expect in such a booming metropolitan area.

Reap the professional rewards of a career tailored to individual pursuits. And the personal rewards of a lifestyle that moves at your own pace. Openings are available in the following areas:

Business Programmer Analyst — Design, develop and maintain appropriate programs utilizing TSO, MVS and VM/CMS. BSCS or equivalent experience required. Previous experience in the electronics industry a plus.

IMS Programmer Analyst — Develop and maintain IMS database and data communication applications in support of a worldwide, on-line business system. BSCS required, with 3 or more years experience plus a thorough working knowledge of COBOL, IMS and TSO.

Tandem Programmer/Analyst — Develop and maintain manufacturing applications on Tandem computing equipment. Requires BSCS or equivalent background, plus 3 or more years COBOL experience, preferably in an on-line manufacturing environment.

Mark IV Programmer/Analyst — Develop and maintain personnel applications on large IBM mainframes utilizing TSO, CMS and SPF. BSCS or equivalent background, plus 3 or more years Mark IV programming experience required.

International MIS Manager — Assignment in Hong Kong or Seoul, Korea involves the implementation of common software developed in the U.S., tailored to meet the manufacturing and financial systems needs of the Seoul or Hong Kong operation.

What could be . . . is.
At Motorola's Semiconductor Products Sector. A company creating the future. And providing a solid foundation for your personal and professional pursuits. Join us. Call Mike Yount, at (602) 994-6503, collect, or send your resume to:

PROJECT LEADER

Project Management in Scientific Systems/Data Communications

The Scientific Systems Division, as a part of SOHIO's Cleveland Data Center, functions in a total demand environment, providing solutions to the scientific user community for scientific, engineering and mathematical problems.

We're offering a unique opportunity to lead exciting projects in the innovative use of leading edge technology. For example, we are now designing a HYPERCHANNEL communications network which provides intelligent data transfer between VAX and PRIME minicomputers, Control Data mainframe, CRAY and Control Data super computers.

The experienced professional we seek must be thoroughly knowledgeable in the scientific computing environment. You should have an MS in Computer Science, Physical Science or Engineering. We also prefer that your background includes planning communications configurations for Control Data computing systems, familiarity with Cyber 200 machines, and strong leadership capabilities.

You will lead a project task force of highly qualified technical professionals, with primary responsibility for developing requirements, selecting vendors, planning and implementing solutions to user needs.

This high visibility position offers opportunities for close working relationships with systems and user management and potential for career advancement. SOHIO offers a highly competitive salary reflecting your individual experience, an excellent benefits package, and a working environment suited to personal and professional growth. Our comprehensive relocation package for new hires includes all normal moving expenses. Homeowners also qualify for mortgage interest differential allowance, third party home purchase and other features typically restricted to internal transfers.

Take the first step in joining one of the nation's most successful business entities by sending your resume detailing your education, experience and abilities in strictest confidence to:

Software Development Engineers

If you want to build a new software division capable of providing total life cycle support...

Harris Can Make It Happen

If you want an aggressive entrepreneurial setting—then the Software Operation of Harris Government Information Systems Division could be the place for you. We are developing and using state-of-the-art methodologies, and have the opportunities for you to achieve the recognition you deserve. Positions are available in our Florida, Colorado Springs, and Washington D.C./Baltimore facilities. Requirements: BS in CS, EE or related technical disciplines. MS or PhD desirable. Experience in the government contracting environment helpful.

SOFTWARE SYSTEMS ENGINEERS
System-level design experience desired in some of the following: C³I Systems, Large Scale Databases, Local and Wide-Area Networks, Real-Time Data Acquisition, Interactive Graphics, Modeling and Simulation, Man-Machine Interface, Advanced Software Methodologies and Software Tool Development. Experience desired with Requirements Analysis Languages, Subsystem Definition, Proposal Preparation and Software Costing Models.

SOFTWARE DEVELOPMENT ENGINEERS
Experience sought in the design and implementation of software using structured languages (and programming techniques) including PASCAL, "C," ADA, FORTRAN 77 with DEC, DATA GENERAL, or HARRIS 800/500 Systems. Exposure to modern design methodology (such as PDLs) and structured development (team concept/structured walkthroughs) of medium to large scale software systems desired.

We are part of the Fortune 200 Harris Corporation, Florida's largest industrial employer. We offer an excellent compensation and benefits package, a formal merit review program, and outstanding advancement opportunities.

If you feel that your present position doesn't offer the kind of challenge and recognition you really want, call Julian D. Kaufmann, COLLECT, Monday thru Friday, 8 am-5 pm, EST at (305) 676-6467, for more information. Or send a resume to his attention at Harris GISD— Software Operations, Dept. CW, 150 Wickham Road, Melbourne, Florida 32901-1132. For further information after business hours, call 1-800-327-8552.

U.S. CITIZENSHIP REQUIRED.
SBI MAY BE REQUIRED.

Marketing Communications... Key To Our Business Success

We Make Information Work

General Electric Information Services Company provides software solutions that are the heart of today's information services industry. We maintain the world's largest commercially available teleprocessing network and are pioneers in the integration of applications software, data processing and communications technology. The GE Marketing Communications experts significantly contribute to the success of our business.

Manager, Product Communications

A highly visible position with complete responsibility for the planning, development, implementation and budgeting of product marketing communications programs that reflect business objectives and marketing strategies. Direct the activities of a staff of communications specialists to establish a balanced program that uses an integrated mix of communication elements and manage the use of outside suppliers. You should have a minimum of 8 years of progressive experience in a key communications role with responsibility for promoting high technology products, including program management and budget preparation and control experience; a sound background in the selection and management of external sources, solid writing and presentation skills. Advanced degree in communications or marketing preferred.

Sr. Product Communications Specialist

Will be responsible for overall marketing communications planning and implementation for several of our major products. This will involve planning, strategizing, and the effective utilization of advertising and sales promotion, collateral materials, audio-visual media and trade shows, with full budget responsibility. Your background should include 3-5 years' sales promotion experience in data processing or a related technical industry. Good writing skills and demonstrated experience working with advertising agencies, design studios and other outside suppliers is preferred.

Sr. Press Relations Specialist

Coordinate and implement GE Information Services trade and business press relations activities. As a significant contributor to our marketing communications business, you will plan and implement press relation projects, interface with all levels of company personnel in development of press relations material, and represent our business in the implementation of those projects. The successful candidate should have 7 or more years' experience in writing and editing press releases and feature articles, demonstrated success in working with the data processing media and general business press, and the development and implementation of media relations plans and projects in a high technology industry. Experience with special events planning and management and audio-visual techniques is a strong plus.

Our Future And Yours

Our strong marketing communications program supports the major role we play in business information solutions. If you are interested in learning more about the rewards of being a GE Information Services employee, send your resume and salary requirements to: **Professional Recruiting (M-6362), General Electric Information Services Company, 401 North Washington Street, Rockville, Maryland 20850.**

Codex Communicates Success.

For over 20 years, Codex has communicated success. In data communications. In computer networking. In career opportunity. You can be an essential contributor to our continued success. Join us in one of the following positions.

Principal Support Engineer

You will be responsible for both pre-and post-sales support of the T1 Mux, to insure total customer satisfaction with advanced Codex communications solutions. To qualify, you should have a BSEE plus a minimum of 5 years of sales support experience. An in-depth knowledge of T1 Carriers, PBX interfaces, product design and data communications systems problems is essential. Excellent communications and interpersonal skills are a must.
Contact Paul Johnson.

Manager—Systems Integration & Applications

You will manage the day-to-day department operations, both technical and administrative, of the Systems Integration and Applications group. The group's primary function is to insure the technical integrity of communication systems that meet specific customer needs. The engineers in this group have responsibility for the design, integration, installation, and acceptance of major communication systems; pre- and post-sales, engineering support (consulting); and custom engineering of systems products or specials. Minimum of 5 years of applicable experience in the telecommunications/data communications field which must include at least 3 years of managerial experience.
Contact Paul Johnson.

Engineer—Systems Integration & Applications

You will provide the engineering support necessary to successfully integrate and install major communication systems. Individual has opportunity to provide pre- and post-sales engineering support, and design and support customer specials (RPQs). Individual will primarily work in conjunction with a project engineer. Minimum of 3 years experience in the telecommunications/data communications environment. BS in Engineering/Computer Science or equivalent in years of experience. Knowledge of protocols; exposure to datacomm applications, field service or application engineering experience a plus, but not necessary.
Contact Paul Johnson.

Principal Software Engineer

You will work with Codex professionals in the development and enhancement of communications software for network processors. Specific duties include coding programs and tools in "C" and Assembler languages, performance benchmarking and analysis of UNIX™ operating systems and working with users to ensure the optimum performance of internal communications software. To qualify, you must have a BSCS or its equivalent, plus at least 7 years of programming experience utilizing a high level language (e.g. PASCAL). An in-depth knowledge of UNIX™, "C" Language, and proper coding and documentation techniques is essential.
Contact Bob Lippman.

Please forward your resume to CODEX CORPORATION, Dept. 288-336, P.O. Box 567, Canton, MA 02021, to the attention of the appropriate individual.

ACADEMIC COMPUTING OPPORTUNITIES

Academic Computing Services at the University of Delaware invites applications and nominations for two management positions: Assistant Director and Manager of Technical Services. The positions are available immediately.

The University of Delaware is embarking on major enhancements to academic computing: installation of an IBM 3081D running VM/CMS, additional hardware to augment the current UNIX service on two VAX 11/780s and two VAX 11/750s, development of microcomputer use and additional staff for Academic Computing Services. These changes are part of a plan to provide computing as an integral part of all academic programs at the University, both in research and instruction.

The two persons sought will provide leadership in providing a good computing software and hardware environment for the academic program. In addition, the two persons will assist with the orderly transition from the current equipment to the new.

The Assistant Director will work with the Director and Managers to formulate policies for the new VM/CMS service and to formulate a coherent, campus-wide approach to computing with mainframes and microcomputers. Networking to support such an integrated service and the development of personal workstations with UNIX and VM/CMS are two important parts of this campus-wide plan.

Candidates for Assistant Director should have the equivalent of a Ph.D. with 3 to 4 years related experience or a Master's degree with over 5 years related experience. Course work must be in a related field. Experience in a management capacity and experience in instructional or research computing is required. Candidates should possess strong communication skills.

The Manager of Technical Services will be responsible for the detailed planning and delivery of operating system support for VM/CMS and UNIX as data communication services. A major responsibility will be the development of staff to support these efforts. There are currently nine persons in this group and several new positions are to be added.

Candidates for Manager of Technical Services should have 3 to 5 years experience in operating systems or communications support, preferably in an academic computing environment. A Master's degree or equivalent is required as are strong management and technical skills. VM/CMS experience is highly desirable.

Resumes and the names of three references should be sent by April 13, 1984 to Ms. Jane S. Cashman, Director, Academic Computing Services, UNIVERSITY OF DELAWARE, 005 Smith Hall, Newark, DE 19716.

The University of Delaware is an

COMPUTER POWER GROUP PTY LTD

CONTRACTS IN AUSTRALIA
- MODEL 204 DBMS -

Computer Power Group, agent for the Model 204 Data Base Management System, is looking for a range of computing professionals for one year assignments in Australia. Essential qualifications are that the candidates should have at least 12 months experience in the use of M204 and that they are available to commence work in Australia within the next 3-6 months.

The jobs are with Australia's Federal Department of Social Security which has recently ordered 7 large Amdahl mainframes and more than 400 Wang VS processors. This equipment will support a state-of-the-art system making innovative use of Model 204.

The assignments are in Canberra which is Australia's national Capital, a modern city of 250,000 people. Living conditions are attractive. Canberra is only 2 hours by car from mountains which provide good trout fishing in the summer and skiing in the winter. Canberra is also only 2 hours by car from Australia's east coast and the Pacific Ocean.

Remuneration for the assignments ranges from $A30,000 to $A50,000, depending on skills and experience, which compares with the national average income of about $17,000.

Our need is urgent and one of our consultants will be conducting interviews in the U.S. at the end of March, beginning of April.

If you are interested in one of these assignments please call our U.S. office on 214-556-2930.

CONTRACT ASSIGNMENTS IN SYDNEY AUSTRALIA

Experienced 'HOGAN' analyst/programmers required for 12 month minimum contracts. HOGAN experience essential, flexible start dates. Return air fares, etc.

KAPITI FOREIGN EXCHANGE SYSTEM

Analyst/programmer required. Immediate start, 6-12 month assignment. 'Kapiti' experience essential.

JOINT VENTURE

Combining the best of both worlds.

Based in Central London, Computastaff Limited are one of the largest British, independently owned consultancies specialising in the recruitment of contract and permanent data processing personnel.

Working on behalf of blue-chip clients, we currently have 15 sales personnel employing more than 200 consultants worldwide, with our success being reflected in billings in excess of $7 million. To meet our objectives in the medium term, we are looking to expand our international contract activities by establishing a compatible and mutually beneficial link or partnership with a similar consultancy or agency operation based in New York or on the Eastern Seaboard. In forming such a relationship we envisage a split profit/overhead arrangement subject to individual requirements.

Priority will be given to such organisation which can demonstrate a combination of professionalism, market knowledge and growth potential.

To explore this exciting opportunity, principals only should apply to:

DATABASE ANALYST

Tesoro Petroleum Corporation is a multi-billion dollar integrated natural resource company engaged in various segments of the energy industry including refining; marketing and transportation of crude oil supplies; leasing of oilfield service equipment; contract drilling of oil and gas wells, exploration, development and production of crude oil and natural gas.

We are currently seeking a Database Analyst, for our Management Information Systems Department headquartered in San Antonio, Texas.

The position has been created by the company's recent commitment to using ADABAS, NATURAL, COM-PLETE, and CICS in a large IBM main frame environment. Responsibilities will include maintaining the availability and integrity of the ADABAS data bases. Other responsibilities will be to enable TESORO to realize the full benefits of using a 4th generation language and data base technology.

A BS or BA degree, preferably in Computer Sciences or Business, is required plus a minimum of 3 years relevant data processing/database design experience. Excellent communication skills, experience with database design methodology is necessary. Knowledge of ADABAS internals and NATURAL programming is required with knowledge of COM-PLETE helpful.

We offer excellent salary, benefits, relocation and career opportunity.

If you meet the above requirements, send your resume in strictest confidence to:

LOOKING?

Find the job you want in Computerworld's classifieds. No other publication carries as many ads for computer professionals as Computerworld, so no other publication can give you as wide a choice of jobs, salary and location as Computerworld. You can even try a "Position Wanted" ad to look for exactly what you want, where you want.

Be sure you look over our recruitment ads every week, so you don't miss the opportunity that's just right for you.

HOW TO SAVE $30,000 PER MONTH ON A 3083 LEASE.

Lease the same 3083 that IBM leases for over $92,000 per month from Randolph—for less than $62,000 per month. That adds up to savings of $1,440,000 over a four-year lease period. If you're renting an older machine, Randolph may save you even more—and you'll get about four times the throughput in the bargain.

WHEN IS THE BEST TIME TO TALK TO RANDOLPH ABOUT LEASING A 3083?

Now—because Randolph has 3083's available for 4th quarter delivery. But it's never too late, even if you already have a machine installed. Whatever your situation, we can tailor a lease that will fit your exact needs and let you start saving money right away.

TALK TO RANDOLPH NOW.

We can solve problems like these, and more . . .
Stuck with a lease on your old machine?
We'll sublease it, and provide a new lease on a 3083.
Own a 3083 but need cash?
Sell your machine to Randolph, and we'll lease it back to you.
Machine installed on a rental basis?
We'll show you how to end the lease and install a new 3083. Any termination charges can be folded into your new Randolph 3083 lease.

LEASING COMPUTERS IS OUR ONLY BUSINESS.

At Randolph, our people have an average of 18 years in the DP industry . . . from 360's to 3081's. They know all about alternative financing to be sure, but they also know their way around a DP department and the hardware in it.

WE LEASE MORE THAN 3083's.

Whatever your needs, now is the time to talk to Randolph. We provide leases for IBM 303X, 4300 and 3081 systems and peripherals—disks, tapes—as well as 3083's.

UNIQUE FINANCIAL STABILITY.

We're an important part of one of the nation's oldest and leading financial institutions . . . The First National Bank of Boston. 19 years in computer leasing gives added assurance that Randolph will continue as the leader in the computer leasing industry . . . continue to live up to the terms and conditions of our agreements . . . provide upgrades . . . fulfill all of our commitments.

LET RANDOLPH HELP YOU SAVE $30,000 PER MONTH.

We can solve a lot of problems for you, and save you money, too. Talk to Randolph now . . . call Joseph B. Kelly, Jr., Executive Vice President, 800-243-5307.

BUSINESS OPPORTUNITY

OPPORTUNITY DOESN'T KNOCK ANYMORE.

IT BEEPS.

The microcomputer revolution is well upon us. And as a result, so is the demand for the necessary software.

The Software Place has been designed to meet this demand. As one of the finest sources of business and personal software, now expanding in selected markets across the nation, The Software Place is part of a retail segment that analysts project will more than double in sales each year to $2.9 billion by 1988.

And you can be a part of it.

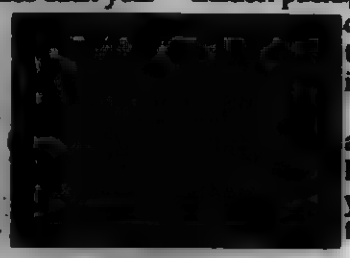
Franchise opportunities are now available to qualified individuals with $50,000 liquid capital plus additional financing.

Our comprehensive program will take you from site selection through store opening and beyond, including ongoing technical support, advertising and more.

We'll even help you prepare a business plan.

For full details, give us a call to find out how you can obtain our complete information package, including our videotape. But do it now.

Because when an opportunity like this beeps, you can't afford to knock around.



THE SOFTWARE PLACE™

8708 North MoPac Blvd, Suite 165 · Austin, Texas 78759 512 343-0414

BUYING?

Whether you're looking for big computers little computers, terminals, printers, software, time sharing or services, you'll find it in *Computerworld* classifieds.

Pages of ads every week, with everything from Discs to DEC's from time sharing to terminals, and software for every size computer system.

You'll find what you need in *Computerworld* classifieds.

Call 800-343-6474 (or 617-879-0700) for more information

ORDER FORM

COMPUTERWORLD BULLETIN BOARD

Issue Date: Ads can be accepted up until the Monday preceding the issue desired. Computerworld comes out every Monday.

Classifications: Most ads will be classified according to the brand of equipment that is being bought or sold. These classifications include Burroughs, Data General, Digital/DEC, Hewlett Packard, Honeywell, IBM, NCR, Sperry Univac, Salvage, Terminals, Misc. Systems and Miscellaneous.

Copy: Copy sent in via the mail or telecopier (telecopier extensions are 410 and 451) should be clearly typewritten. Ads may be given over the phone to our team of ad takers. The standard size is 1 column by 1 inch deep. These units may be combined to form larger sized ads. Describe the equipment very briefly, give the price and the name of the person to contact. All ads will be set up using a standard format. No borders or logos are allowed.

Cost: The price for each standard unit is $130.00 (One unit minimum and no fractional units allowed.) There are no agency commissions and no quantity discounts.

Billing: Once you've written your ad, send (or call) it in with your name and address for billing purposes and we'll run it. (If your company has never advertised with us before, we request a check with your order.)

Only MSA software makes your mainframe work 100 times better

1. Now MSA's Executive Peachpak™ II software links personal computers to the mainframe. So you can...

2. Use your PC to access all your MSA mainframe systems, from General Ledger to Manufacturing.

3. Access entire mainframe files, so you can work with large amounts of information at one time.

4. Get HELP if you need it, with a built-in feature that guides you through the system.

5. Choose the exact mainframe information you need, as much as you need, in the form you need.

6. Use it with Peachtree Software, 1-2-3™ from Lotus, DIF™ VisiCalc™ or other micro software.

7. Enjoy a real-time environment, no waiting for processing.

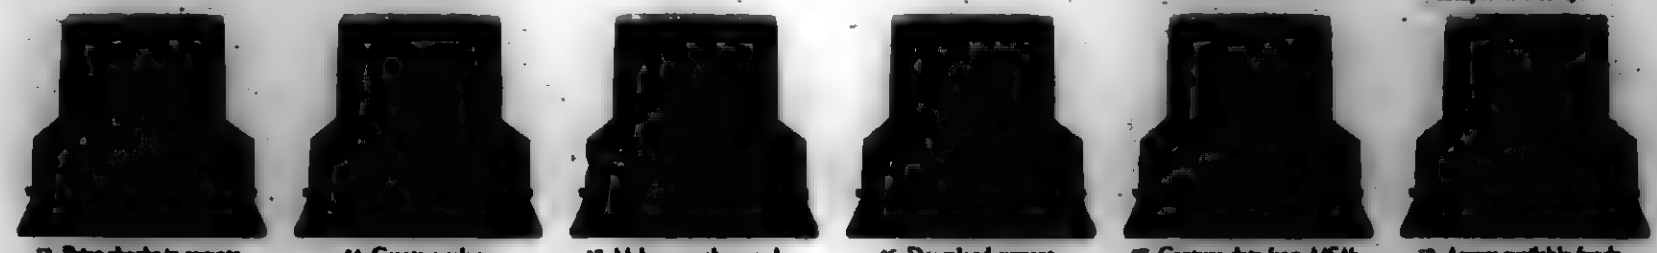
8. Allow only authorized personnel access to the mainframe, due to built-in security.

9. Get database-to-database transfer with Database Sharing.

10. Use over 20 predefined applications from MSA. For example...

11. Use PeachLink™ to download information from both MSA and non-MSA online mainframe systems.

12. Download vendor history from MSA's Accounts Payable System and use PeachCalc™ to do comparative analysis.



13. Print checks in remote locations from mainframe Accounts Payable data.
